

## **IN DEFENCE OF LEGITIMATE DISSENT 1980-1999**

**By DR. JOAN RUSSOW**

### **( PART ONE)**

“Yet all experience is an arch where-through gleams that untraveled world..” (Tennyson )

#### **INTRODUCTION**

In 1997, I discovered that I had been placed on a 1997 RCMP threat assessment list prepared by police and intelligence officials for the gathering of APEC leaders at the University of British Columbia. Since that time, I have been trying to discern why that action was taken.

Here is my affidavit documenting my actions from Part I, 1982 -1999 and Part II, 2000- until 2005,when I gave a presentation to the Canadian Senate and when I was in court in 2005 and submitting an earlier version of “In defence of legitimate Dissent for the judge to determine whether I was a threat and if so, for whom I was a threat.

The following is the copy of the RCMP Threat Assessment image I have blocked out the names of the others on the list:

OTHER ACTIVISTS

 <p>DOB: 1953-09-19 Potential to be Violent HIV Positive AIDS Activist, White male, 175cm, 64kg, brown hair, brown eyes</p>	 <p>DOB: 1961-11-21 AIDS Activist</p>	 <p>DOB: 1963-06-23 Lesbian activist / marching White, female, 180cm, 95.5kg, brown hair, very masculine</p>	 <p>DOB: 1966-11-21 Anarchist / activist</p>	 <p>DOB: 1971-04-3 Activist</p>

5. Two members of the media attending UBC last night as invited observers were noted to be overly sympathetic to the APEC Alert protestors. Both subjects have had their accreditation seized.

The first subject is Dr. Joan RUSSOW federal leader of the Green Party. Second subject

No dissemination without approval from NCO Vc APEC Threat Assessment Joint Liaison Group

EXHIBIT

The above RCMP Threat Assessment list was faxed to me *anonymously* by a participant at the APEC inquiry.

( ) Here is a copy of a letter written by MP Murray Rankin

EXHIBIT

**2016** The Honourable Ralph Goodale, M.P.  
Minister of Public Safety  
House of Commons  
Ottawa, ON, Canada  
K1A 0A6

Dear Minister Goodale,

I write to you on behalf of my constituent, Dr. Joan Russow. She is an academic, an environmentalist and former leader of the Green Party of Canada.

In 1997, Dr. Russow discovered she had been placed on an RCMP threat assessment list prepared by police and intelligence officials for the gathering of APEC leaders at the University of British Columbia. Since that time, she has been trying to discern why that action was taken.

Over the years, Dr. Russow has filed official complaints with the Commission for Public Complaints Against the RCMP, CSIS, and SIRC and she has submitted over fifty access to information and privacy requests. Unfortunately, these documents have been unhelpful because pertinent sections are always redacted. Despite years of exhaustive inquiries, Dr. Russow still does not know why she was placed on a threat list.

Her situation has been covered in the media in the past by journalists concerned with dissent in Canada. It is certainly troubling to consider that citizens who engage in perfectly lawful advocacy protest and dissent — which are supposed to be protected in the CSIS Act— may be being placed on a threat assessment list.

Dr. Russow believes she was discriminated against for political reasons which would be a violation of her rights. Pursuant to Article 2 of the United Nations' International Covenant on Civil and Political Rights:

“Each State Party to the present Covenant undertakes to respect and to ensure to all individuals within its territory and subject to its jurisdiction the rights recognized in the present Covenant, without distinction of any kind, such as race, colour, sex, language, religion, political or other opinion, national or social origin, property, birth or other status.”

I ask that you provide an explanation as to why Dr. Russow was added to this threat list in the first instance. Dr. Russow feels she and her family have been burdened by the stigma associated with her unnecessary inclusion on this list for years. She has my full support in her pursuit of a satisfactory explanation.

We eagerly await your reply.

Sincerely,

Member of Parliament  
Victoria, BC

In 2020, I still have not found out. Was it because, in the 1960s, I was asked by the RCMP, to spy on the Czechoslovakian Military and deputy Military Attache who were my English students; the latter was described as one of the most dangerous spies when he was in Cuba, and I refused? Or even further back, I was going out with the Italian Communist who organized the Agrarian Reform Protest, with oxen, marching from Perugia to Rome singing “mai due senza tre”, after two cardinals had died? Or was it my years of engaging in Legitimate Dissent? Will I ever know?

In April 2022, I contacted Murray Rankin to find out if he ever received a response and I just found out that he never did. Today , April 4 2022, he responded that he would resend the letter.

#### **PART I 1982-1999**

By Joan Russow, PhD

I found out that in 1997 I was placed on an RCMP Threat Assessment list

#### **EXHIBIT**

I have set it up as an affidavit for readers to discern for whom was I a Threat; was the RCMP justified in placing me on an RCMP Threat Assessment List, and in causing me to live until the present with the stigma of being on the list.

#### **COMMENT:**

In 1997, I found out that I was placed on an RCMP Threat Assessment list

#### **EXHIBIT**

Photo of list; See above

I have set it up as an affidavit for readers to discern for whom was I a threat; was the RCMP justified in placing me on an RCMP Threat Assessment List, and in causing me to live until the present with the stigma of being on the list.

DEDICATION: TO THE RCMP WITHOUT WHOM I WOULD NEVER HAVE FILED THIS AFFIDAVIT

WITH THANKS TO Jim Bronskill who continually published updates on my struggle to find out the reason for my being put on the list; including his article in 2001 on the Criminalization of dissent which is referred to in Part II: In Defence of Legitimate Dissent 2000-2005

The content of this affidavit is based on what has been stored in my desktop and is based on long tedious documents.

In order to peruse the content quickly , do a search through ( ) WHICH I INSERTED AT THE START OF EACH ITEM

CAVEAT-SPELLING

The spelling is set for American spelling: all the references to international law and to the United Nations are in British English. Many documents are written in Canadian English with international references in British English. Because of the length of the document, [7000 pages], the spell check. Some words may be found in either language setting. I gave up trying to edit all sections to make things more contiguous.

**BACKGROUND INFORMATION-**

( ) **THAT** I am Joan Russow of 1230 St. Patrick St. Victoria, BC

( ) **THAT** I have brought up four children, I have seven granddaughters and I am now a senior citizen

( ) **THAT** I have studied art and architecture for three years in Paris, Rome and Seville, and one year of Common Law at the university of Ottawa

( ) **THAT** I have a BA in Pre-Colombian Mexican art and I have a Master's degree in Curriculum Development and innovated Principle-based education: a method of teaching human rights linked to peace environment social justice issues within a framework of international principles

( ) **THAT** I have a doctorate in Interdisciplinary Studies and in my Dissertation, I examined the problem of expressing and communicating complexity and the implication of imposing of simplistic models on the complexity of thought.

( ) **THAT** I became concerned about the failure of governments to implement international obligations beginning , in 1946 when my father, who was the Asst Auditor General of Canada, worked at the UN in New York, and told me that all the UN delegates were housed in the Lido Beach hotel because the black and colored delegates could not find non-discriminatory accommodation in long island where the UN was located in 1946 in Lake Success.

( ) **THAT** I have been mostly a non-remunerated policy analyst examining the complexity and interdependence of peace, environment, social justice and human rights issues

( ) **THAT** I was a former sessional lecturer in global issues, environmental studies program university of Victoria 1992-1996

( ) **THAT** I was the former leader of the Green party of Canada from April 1997 to March 2001 and that I ran in two Federal elections in 1997 and 2000 in the riding of Victoria, and in a by-election in 2000 in the Okanagan

( ) **THAT** I am A Member of the IUCN (World Conservation Union) Commission on Education and Communication

( ) **THAT** I Founded the Global Compliance Research Project: a project involved with ethical governance based on principles extracted from International instruments related to the furtherance of the "public trust": guaranteeing human rights, including women's rights, indigenous rights, and minority rights and including economic, social and cultural rights, and civil and political rights; protecting the environment and respecting ecology ; preventing war and conflict, and ensuring social justice. The purpose of the project is:

- to educate citizens about government obligations incurred through treaties, conventions and covenants; government commitments made through declarations and conference action plans, and government expectations created through General Assembly Resolutions.
  - to publish documents and report cards based on previous obligations, commitments and expectations
  - to introduce public trust principles into presumably reluctant fora
- For example, there was a considerable amount of discussion in the session on regulations about the Triple Bottom line at the 2000 Globe [Trade] Conference. I proposed the quadruple bottom line -- under the international public trust United Nations regime: (i) guaranteeing human rights, including labour rights, women's rights, Indigenous rights; (ii) protecting the environment and ecology; (iii) preventing war and conflict and (iv) promoting socially equitable and environmentally sound employment.
- to determine what would constitute compliance with international principles enunciated through the United Nations system
  - to develop principle-based educational material within a framework of international law.
  - to lobby governments to sign what they have not signed, to ratify what they have not yet ratified, and to enact the necessary legislation to ensure compliance. In this context, the Global Compliance Research project circulated a petition at the Beijing +5 conference in New York calling upon all governments to sign and ratify, and comply with all human rights conventions and covenants.

( ) **THAT** in 1982, I attended the Vancouver first Peace Walk 168 groups We gathered in Kits beach groups where there were not that

many, but then it swelled to 35 000 The size reflected the concern about the escalating nuclear arms race,

## PERSONAL BACKGROUND

( ) **THAT** from 1968, I was bringing up four children and working on my BA, M Ed, and PhD

( ) **THAT** in 1986, I completed my M Ed in curriculum development, by developing a method of teaching human rights linked to peace, social justice and the environment within a framework of international law; and that I became aware of the range and extent of obligations incurred through Conventions, Treaties, and Covenants, of commitments made through Conference Action Plans, and of expectations created through UN General Assembly resolutions, and Declarations

( ) **THAT** for over 30 YEARS, I participated an academic, as member of an NGO or as a reporter in international conferences:

- 1976 *Habitat i in Vancouver*; *Prepcom for UNCED 1992 in New York*; 1987 Stein Valley
- 1990 Learneds in Victoria
- 1991 Learneds in Kingston *UNCED 1992, in Rio*

ECO-ED 1992, in Toronto; [1992 National Research in Science Teaching \(NARST\) PAPER ON THE DELUSION OF CERTAINTY IN SCIENCE](#): 1993 part of an international research programme, on a 8 country study on climate change at the Kennedy School of Government at Harvard; 1994, IUCN 1994 resolution on Canadian forests passed at the International (IUCN) AGM **1993 World Conference on Human Rights ideagraph for this conference displaying the range of applicable international instruments 1994 Conference on Population and Development**: 1995 PREP-COM for Conference on Women: Equality, Development and Peace 1995 in New York, AT; 50<sup>th</sup> anniversary of the signing of the Charter of the United Nations , in San Francisco, conference, 1995, in Beijing; Habitat II 1996 in Istanbul; the Hague Peace conference in 1999, in den Hague; Beijing +5 2000 in New York; Habitat II.+5, 2001 in New York; WSSD 2002, in Johannesburg; Uniting for Peace Women say no to war in 27 different languages March 3 2003 in New York;; Uniting for Peace upholding the Charter and international law September 2003 in New York against the invasion of Iraq; . CSD12 2004 not further unraveling of UNCED obligations and commitments in New York; September 11 2004: UNESCO meeting in Halifax in 2005 and worked on a resolution related to granting more power to the UN General Assembly; Beijing +10 2005 in New York; May in the Hague attended a conference of 50 women mostly from the US and Netherlands, but also from other countries to address the issue of post conflict resolution. Gave a presentation, to the Dutch military on the importance of prevention of war, of the International Court of Justice, of need to reallocate the military budget; DPI session on climate change, 2007 in New York; COP15 2009 in Copenhagen; COP 16. 2010 in Cancun; Rio +20 2012 in Rio; High-level Meeting of the 68<sup>th</sup> Session

of the General Assembly, 2013 in New York; United Nations Sustainable Development Summit 2015 in New York; COP 21, 2015 in Paris, *United Nations Conference to Negotiate a legally Binding Instrument to Prohibit Nuclear Weapons*, Leading Towards Their Total Elimination June 2017 in New York.

Also I participated in several other UNGA AGMS; most CSW from 1994 – 2016; many CSDs, and a number of NPTs, and as a member of IUCN Commission on Education and Communication, conferences 1994 in Buenos Aires; 1996 in Montreal; and 2016, in Hawaii. A litigant in court case to end 'bible trading in the school and in a court case to set aside an injunction against protesters in Clayoquot sound where 1000 activist were arrested. submitted in court, a leave to appeal to set aside the injunction issued against protesters against logging in Clayoquot Sound

## AN ENDLESS LIST OF LEGITIMATE DISSENT OR THREATS

~1980

( ) **THAT**, in 1980 I walked in an Anti-Racism March in Vancouver

~1982

( ) **THAT** In April 24, 1982: the Walk for Peace, organized by End the Arms Race, attracted 35,000 citizens.

### COMMENT ,

I had participated in peace walks in Vancouver before 1982; but in 1982 I went to Kits beach and there were not that many people there, we marched and suddenly we saw a large contingent coming towards us; there ended up being eventually 35,000)

( ) **THAT** in 1982 I attended a Symposium "a Canadian Perspective," organized by the UBC students of Peace and Mutual Disarmament. I heard Michael Wallace, a political science professor at UBC, speak about Canada's role in the arms race: "Canadians should not act so self-righteous when they talk about disarmament. We are as much to blame as any other nation," he said. Wallace denounced Canada's sale of CANDU nuclear reactors to countries with unstable governments. "What do we do if some government violates our 'strict' safeguard?" "Send in the Mounties?" It is well known that, in the 60's, Canada sold nuclear reactors to both India and Pakistan and they developed nuclear weapons with Canadian technology. Also, Dr Fred Kennelman always asserted that, "There is a little bit of Canadian uranium in all US nuclear weapons.: to support this claim, he cites the fungibility Principle

### COMMENT;

At that conference, a demonstration was described where the protesters were able to get to create a facade, in a store front, with apparently Canadian Defence paraphernalia giving the impression that it was a Canadian government information centre; but inside there was only anti-nuclear weapons material

~1983

( ) THAT in 1983, I addressed the intrusion of American fundamentalism into promoting nuclear weapons

**COMMENT**

I saw (surprisingly) on public television, a program featuring the Christian Round Table. Macateer from the Christian Round table described Nuclear weapons as being part of "God's design" I became increasingly concerned about Christian Fundamentalism

( ) THAT in ,1983, I became concerned about US Christian fundamentalist's intrusion into Canadian politics

**COMMENT**

Increasingly I became concerned about the intrusion of American styled fundamentalism into the Conservative party of Canada. I contacted the secretary of the BC Conservative party. She told me that she was equally concerned and that Jerry Falwell through youth representatives was attempting through stacking the youth conservative meeting to take over in B.C. She also mentioned that she had been called by a group about immigration about a meeting at the Empress and at the meeting the first statement was "I see that all of you are of European Origin and this is the way we want Canada to be.

( ) THAT, I wanted to expose a religious program that posed as a public affairs program: club 700  
Club 700.

**COMMENT**

I wanted to find about more about the intrusion of fundamentalism. I contacted the 700 club--the religious program that gives the illusion of a public affairs program, and mentioned that I had just arrived in Victoria from Kelowna and I was interested in becoming involved in politics. I was asked by the women who answered the phone if "I was born again": sensing that this was a password. I meekly said yes anticipating interesting consequences. She said there is a group in BC called "Prayer BC" and this group has access to the legislature, and that I should call XX at Midland Doherty to find out how I could participate. I called XX and was asked again if I was born again, Again I responded yes. XX told me that I should not tell the other churches about this but we have access to the legislature through the Speaker of the house , Shrader was a born again Christian.  
again Christian (Gracie was one too)

( ) THAT I supported Bob Moore Stewart's Case; eventually this practice was stopped as a result of a wide range of "religions" including sun worship wanted access as well. was involved in the case.

**( ) THAT I was involved with Operation Solidarity**

**In 1983 on the advice presumably of the Fraser Institute, the Social Credit government embarked on major cutbacks in social programs, on revision of the Human Rights legislation. For a period of time community groups and unions were meeting about the impact and consequences of the Fraser-institute driven government policy. I attended a meeting of the Vancouver Human Rights Coalition about whether the Human Rights Coalition should endorse Operation Solidarity. A representative of the BC Human Rights Commission**

**She said that we would lose credibility if we joined in. Hanny and I argued forcefully that we would lose credibility if we did not support Operation Solidarity. We persuaded the Coalition to support Operation Solidarity. .**

Rod Dobell wrote an excellent paper on the influence of the Fraser Institute in developing Government restraint program.

Incredible operation Solidarity rally, at the Leg, there were an estimated 25000 there.

**( ) THAT in 1983, I was the co-founder of the Vancouver Island Human Rights Coalition.**

**( ) THAT in 1983 I was a member of Operation Solidarity**

**The largest protest in the history of Victoria**

**COMMENT**

In 1983, all the local Victoria activists were supporting Operation Solidarity. We had a meeting of the Vancouver Island Human Rights Coalition to decide if we would support Operation Solidarity. All the representatives in the Coalition except one voted yes. The negative vote was from a member who was representing the BC Human Rights Commission; she said that if we did support Operation Solidarity we would lose credibility. Hanny Panaker and I said that we would lose credibility if we did not support Operation Solidarity. Our motion passed.

~1985

( ) THAT in 1985, I worked with the Vancouver Human Rights Coalition to organize a conference with First Nations on the impact (upon First Nations) of Residential schools

## COMMENT

~1986 bible reading

I had been working with the Vancouver Jewish Community on a campaign to end the reading of the Lord's prayer  
Initially, we were working with a lawyer in Vancouver and we waited for the case to go to court. We were eventually told a year later that she had had an ultimatum from her firm that she could take on the case or stay with the firm.

I was now living in Victoria and was doing research on how the reading of the lord's prayer violated the Charter of Rights and Freedoms. I contacted a lawyer in Victoria and he agreed to take on the case. Eventually, the BC Civil Liberties agreed to take on the I was asked by the group in Vancouver to be the litigant in the case because they did not want it to be perceived as a conflict between the Christian and Jewish communities: I am an Atheist. When the Royal yacht arrived with Charles and Diana for the opening of Transpo; on the front page of the Times Colonist was a picture of their arrival with my picture below along with an article about the lord's prayer case.

~1988

Ideagraph- a large mind map

( ) **THAT in** 1988, I helped UVic Professor Larry Yore organize a symposium on Critical Thinking for NARST: National Association of Research in Science Teaching "Towards a Unified Conception of Thinking".

;

I co-authored, with Larry Yore, a paper entitled on Moving Beyond Simplistic Models of Critical Thinking.

~1988

## COMMENT

I Prepared an ideagraph of processes of thinking. During the summer, I was involved with a project determining means of stimulating critical thinking, and organizing a symposium on Critical thinking. I worked, with Uvic Professor, Larry Yore, on reviewing critical thinking models that have been imposed on thought. We looked at IDEAL (Identify, Describe, Evaluate Alternative). In the Ideagraph, I displayed the range of models that we had examined; each one suggesting that it was a definitive mode. I extracted arbitrarily a set of processes that were no more definitive than any of the other models. The reason that I proposed an alternative was to illustrate the arbitrariness of the selection of processes as being essential to stimulate thinking. In addition, often the processes in the models were placed in a predetermined sequence.

Larry Yore Presented our paper and I presented my ideagraph.

1989

THAT in 1989, I received - Award University Fellowship - Award University of Victoria (Interdisciplinary Studies)

( ) THAT, in August 1987, I participated in Stein Valley Festival in Mount Currie

I Went to the Stein Valley festival with Joanne, Susanne in the SNAG group. We took my old army tent made out of parachute silk.

#### COMMENT

I was hesitant about going because my adviser, Peter Evans had arranged for me to be a Member of a Policy Committee that was commissioned by the Ministry of Education to submit a position paper on "Thinking across the Curriculum" and to have input into the ministry of education project on stimulating thinking in the language arts and my input was due on Monday. However, I had already attended so many sessions where the First Nations were speaking out; especially during the all night Pow Wow. I became more and more aware of how powerful their oral communication was and how much it was out of sync with what was demanded in the school system. In contrast to the organized structure for example stating or writing; "I will be making four points etc." they just plunged into communication; each comment generating a new one. I stayed up all night for the incredible POW WOW; listening to various first Nations speak.

About 16,000 people attended this year's Stein Valley Festival.

( ) On Monday I Wrote the section on the importance to stimulate thinking through different forms of "ideation": visualization, verbalization, auralization as means of stimulating, communicating and expressing thought".

( ) THAT, in September 1989, on labour day weekend I went with my son Soren to Sulfur Pass. Got a ride up with a man who had previously been injured in a car accident. We were billeted. The next day we were taken by boat to Sulfur Pass. We were dropped off and then we had to walk for over 2 kilometers through a recently burned clear cut. It was devastating. There was no water anywhere and Soren and I had forgotten to bring water. We thought that eventually we would arrive at a beautiful site for the rally. But no, the ceremony by the chiefs was held in the middle of a clearcut; there was no better way to experience the devastation of a clear-cut. For Soren's 16 birthday (given that he had never been on a plane), we decided that we would go on a plane ride up to the hot springs. Then we tried to hitchhike back and got a ride with a couple who work at the peace house in Nanoose. Unfortunately their car broke down and we had to hitchhike again. This time with an American couple who actually work at the Nanoose base.

( ) THAT, in 1989 I received a summer grant, with UVic history professor Larry Croisier to do a content analysis on World History courses at universities

**COMMENT:**

I investigated the degree of prejudice related to what was designated as “World History” and worked on computer design for the artificial intelligence course related to documenting world history.

~1990

( ) THAT in January 1990, I attended a conference in Clearwater Florida

Noriega surrendered on January 3, 1990. He was detained as a prisoner of war, and later taken to the United States.

**COMMENT**

The perils of Clearwater and Noriega

I was traveling Servas and stayed with a family. I had to take a bus back and forth from the Hotel. One night when I was standing for the bus. A man came over and said that when my wife travels alone on the bus, she always carries a gun and stands under the light. There, traveling by bus is a stigma. When the bus came, I asked driver to let me know when we arrived at my street. She responded how would I know is it near Denny's, McDonalds etc. I had no idea and went passed my stop. I stayed on the bus and returned and finally saw something that looked familiar.

The next day I got on the bus- at that time in the morning there were only blacks on the bus. One of them called out that there was a cockroach and asked the driver to spray the bus. I said “please no spray”, “catch it and I will take it into the Sheraton” where the conference was. They all laughed. But the cockroach was not caught but when it heard it might have to go into the Sheraton it seemed to leave on its own. I was standing waiting for the bus on Sunday finally a man came out from a cafe and gave me a coffee and told me that the bus hardly goes on Sundays. Another time There was an interesting black preacher driving the bus who told me about how unfair it was that people without a car have little access to town on Sunday. On the last day I took a taxi home and got into an argument with the driver when I criticized the Republican party. He drove past my house so I shut up and said nothing and he turned around and dropped me off.

**COMMENT Encounter with the CIA agent**

In 1990, on a flight from Florida to Seattle, I was sitting next to a CIA agent who had been part of the CIA force taking Noriega back to Orlando to be tried in the US [I only found out after we had landed].

For some reason, perhaps due to his investigative curiosity, he opened a conversation by saying I would describe myself as a right wing conservative; I interrupted him and said and you would probably describe me as a “dirty liberal--the right wing definition for the extreme opposition”. I continued and said but “Liberal” and “Conservative” are just labels: we are on a four-hour flight let's see where we stand on different issues. What is more meaningful is to examine what are the policy divisions, and principles and application of

principles. I think that a more valid distinction would be between parties that promote the public trust and those that promote vested economic interest.

I Began to think we had something in common. We were both concerned about forests. In his case it was not about a public forest but his seven acre forest outside of Washington. After the flight, we concluded that the only thing we had in common was that we were both punctual.

When I saw him walking way with two men (one of whom was in hand cuffs), The CIA agent glanced at me but refused to acknowledge me. I guessed being punctual was not enough to be kindred spirits.

As a result of our encounter, I came up with a new term Ego-ecologist.- one who is only concerned with the ecology of his or her own private property.

1990-1992 Co-developed a program for Interdisciplinary studies and for integration of issues within the High School Curriculum and submitted this to the Ministry of Education, British Columbia Input- Sullivan report.

( ) THAT In March 1990, I Carried out research and assisted in preparation of a document on the preservation of old growth forests and environmentally sound forest practices.

( ) THAT in 1990, I drafted a petition calling upon the Governor General to intervene as the "court of last resort," and prevent the Canadian government from supporting the 1991 Gulf War invasion of Iraq.

## EXHIBIT

### **Comment**

I stood in the Mall and collected over 1000 signatures within a short period of time. There was a note in the Times Colonist about my standing alone in the Mall collecting over 1000 signatures within a short period of time.

Raging Grannie, Mary Rose and I decided to present the Petition to the Lieutenant Governor who was the Governor General's representative in BC. Just as we were going into the Lieutenant Governor's residence, we decided that we should present it on behalf of a group. In the petition we had used the phrase that many Canadians were in a state of disbelief because of the new militant role that Canada was playing. So we coined the acronym CIASOD (Canadians in a state of disbelief). We sent out press releases. I contacted Amnesty International; Canada moving away from its traditional peace keeping role. And was shocked by the fact that Amnesty International supported the invasion.

( ) On August 3 1990, the UN Security Council passed Resolution 660 condemning the Iraqi invasion of Kuwait and demanding that Iraq unconditionally withdraw all forces deployed in Kuwait. ... During the Iraqi occupation, about 1,000 Kuwaiti civilians were killed and more than 300,000 residents fled the country.

On 29 November 1990, the Security Council passed Resolution 678 which gave Iraq until 15 January 1991 to withdraw from Kuwait and empowered states to use "all necessary means" to force Iraq out of Kuwait after the

deadline. The Resolution requested Member States to keep the Council informed on their decisions. This was incorrectly deemed to be the legal authorization for the Council but it was not!

Cuba's position was nuanced as it had voted to abstain on previous resolutions relating to the Iraqi invasion, but did not support Resolution 678 because of its authorization of "all necessary means."<sup>2</sup> Iraq accused the United States and Israel of deliberately weakening Iraq by encouraging Kuwait to reduce oil prices. When Iraq began to threaten Kuwait early in July 1990, the United States staged maneuvers in the Gulf to warn Iraq against taking military action against the United Arab Emirates and Kuwait.

UNSC Resolution 678 was adopted by 12 votes with two opposing ([Cuba](#) and [Yemen](#)) and one [abstention](#) from the [People's Republic of China](#).~

A member of the U.S. delegation candidly told the Yemeni ambassador that it was "the most expensive vote you have ever cast," and indeed it was, and might even play a part in the chaos there today. Not only did Washington cut off its \$70 million foreign aid program, but the Saudis also abandoned their long-standing treaty with Yemen which allowed its nationals preferential treatment as immigrant workers.

( ) **THAT** in 1990, I participated Middle East Coalition

**As a result of the article in the Times Colonist, I was called by Mary June Pettyfer, President of the World federalist and invited to a meeting of a newly formed group called the Middle East Coalition.** As a member of the Middle East Peace Coalition, I helped organize a town hall meeting on Iraq

( ) THAT in 1990, We decided that we would write a letter to Prime Minister Mulroney: Bill Pearce (who worked in the Attorney General's office), drafted a letter which was endorsed by the member groups in the Middle East Coalition and put down all the groups whose members were there. Hilda, a raging Grannie, undertook to call as many people as she could think of.

( ) THAT in 1991, **We decided to form a publicity committee to put together a full page ad in Monday Magazine With the letter along with the list of groups to which members in the Coalition belonged**

( ) **THAT** in 1991, I offered to design the ad

#### **COMMENT**

**I went to the Greater Victoria Disarmament Group in 620 View Street to look for photographs. I found two that I thought would be interesting : (i) a 1939 poster " mothers do not raise sons to kill sons of other mothers' (ii) a little boy and a girl from a clip in "if you love this planet."**

Initially, I designed an ad for Monday Magazine with a 1939 poster showing a mother with a bared breast saying "Women do not give birth to sons to kill sons of other women." The group thought it was too risqué so I used the image of a little girl and little boy walking through a path towards an uncertain future - with an image from the film "if you love this planet".

**( ) in 1991, I wrote a letter to the Secretary General of the United Nations. About the UN violating its own charter**

( ) in 1991, my Oped, "The UN may be in violation of its own Charter." was published in the Times Colonist

COMMENT

I received a letter of support from right wing militia group, which opposed the UN

( ) I prepared a questionnaire about Canada's involvement in the bombing of Iraq

( ) THAT in 1990 I was active in the NDP Green Caucus and assisted in the presentation of environmental resolutions as a Delegate at the NDP Convention (1990)

At the 1990 NDP Convention, the Green Caucus delegates, through resolutions related to sustainability, unanimously decried the Social Credit Government for "destroying irreplaceable landscapes, disrupting wildlife, ruining watersheds and damaging fisheries" (1990, p. 11, "Towards a sustainable Future.")

The culprit was identified as the sanctioning of non-ecologically sound logging practices; the victim, the public's present and future ecological rights.

Non-ecologically sound logging practices, prevalent during the Social Credit administration, are currently allowed to persist in the NDP administration and may continue while the newly formed Commission deliberates.

Four months ago, members of the ERA Ecological Rights Association (including Andrew Gage) filed a complaint with the Ombudsman's office about the violation of ecological rights brought about by the Ministry of Forest's non-compliance with the Forest Act. The ombudsman's office is currently investigating how the non-compliance or unfair compliance by the Ministry of Forests has compromised ecological rights.

For years dedicated environmentalists and concerned foresters in different regions of B.C have been compiling data on specific instances of non-compliance to the Forest Act. For this complaint, we are gathering evidence from throughout the province to demonstrate the continual destruction through non-ecologically sound logging practices of the natural environment, and to demonstrate examples of misrepresentation which may have been used to support the granting of permission to use non-ecologically sound logging practices.

Non-ecologically sound logging practices have destroyed and continue to destroy the natural environment.

Yet, the Minister of forests has failed and continues to fail to invoke section 60 of the Forest Act which allows for suspension of licenses.

"Where the holder has failed to perform an obligation to be performed by him under the agreement or has failed to comply with this Act or the regulations, and that the failure of performance or compliance is causing or may imminently cause serious damage to the natural environment." (Section 60 Suspension by officer, Forest Act, 1988).

Non- ecologically sound logging practices have been condoned even though permission to engage in non-ecologically sound logging practices may have been obtained through misrepresentation of information to the public. During the public viewings, often companies give the impression through visual displays which are more accessible to the public than the actual display of the Management and working plans; that the companies will be engaging in ecologically sound practices. In the visual displays there is often "the-protected-fawn-in-the-forest," "the-single-logger-in-a-fully-treed-forest," and the "the-simulation-of-a-small-clear-cut." The public is left with the impression that ecologically sound logging practices will be engaged in.

Yet, the Ministry of Forest fails to invoke section 59 which allows the district manager" to suspend, in whole or in part, rights in an agreement where its holder a) made a material misrepresentation...."(Section 59, Suspension and Cancellation, Forest Act.

One of the outcomes of the investigation by the ombudsman's office hopefully will affect the compensation to companies when sections of the TFL are permanently set aside for wilderness.

Joan Russow  
Ecological Rights Association

( ) THAT in 1900 I helped David White organize visits of citizens to the Walbran to get interest in the campaign to save the Walbran

( ) THAT in March, 1990, I prepared a brief and made a presentation to BC parks board on the need to declare the "Sooke Potholes" structure and surrounding property as an International Ecological Centre

( ) THAT in June 1990, I made a presentation at the Learned in Victoria 1990 June I presented a paper on "The expression and communication of complexity through epistemological editorial symbols" to the Canadian Society for Studies in Education", at the Learned Societies Conference, University of Victoria.

#### COMMENT

THAT I went to literary criticism sessions, and philosophy I was surprised when women who claimed that they were interested in feminist criticism were engaging in the same practice of citing sources rather than coming up with good arguments to support each principle or theory.

In his session which was in French, Karl Popper's said :proceed as though you can make a difference while recognizing that you cannot. [My translation from French]

( ) THAT in 1990, I, reviewed Forest Act and made a submission to the Peal Forest Resources Commission on the failure to implement various sections of the Forest Act

( ) THAT in September 1990, at the Unitarian Church, I helped organize a rally at the legislature

## COMMENT

At the Unitarian Church, I attended a meeting to organize a rally on Saturday. I noticed that there were about 90 people in the room so I said, "we might not get more than 90 at the rally on Saturday, why don't we go over to the legislature now and protest"; it was agreed to go over there and we walked back and forth and eventually about 300 people showed up there.

I have never seen such a biased photo as the one below; an image of an innocent soldier facing a masked activist.

~1991

( ) THAT in 1991, David White and I formed the Ecological Rights Association to make a proposal to enshrine "Ecological Rights" in the Canadian Constitution [Charlottetown Accord].

In 1991 A new group has recently been formed for the purpose of lobbying for the enshrinement of ecological rights in the Canadian Charter of Rights and Freedoms, (and in other national charters or constitutions); for the establishment of an institutional framework to ensure that these ecological rights are protected; for a U.N. Covenant for the protection of Ecological Rights; for the criminalization of acts causing ecological damage; for access to the courts for individuals and community groups wishing to prevent the destruction of their ecological heritage; and for documenting and compiling definitions and descriptions of what would constitute ecological rights.

One of the more controversial proposals in the Federal Government's constitutional package is the proposed enshrining of "property rights" in the Canadian Charter of Rights and Freedoms. The legal system already functions as though property rights were sacred and inviolable. The main outcome of enshrining property rights in the Charter, would be to further limit the possibility of progress being made towards expanding the application of environmental law.

The purpose of the Charter of Rights and Freedoms is to enable individuals to apply to the courts to seek remedies if they believe that their rights or freedoms, as guaranteed by the Charter, have been infringed or denied. The Charter must protect rights that may not be already protected through common law remedies. Individuals must have a "standing" in order to bring a case to court. Standing is usually synonymous with property rights or financial interest, and damages are awarded according to losses of these interests. Although the courts have proceeded to continually address any

infringement or denial of property rights, they have failed to address the serious ecological damage that continues to be done by industry and government alike. There is no redress for individuals, and community groups who object to ecological damage on the basis not of economic interest but of community ecological rights. It is only through the Charter that individuals and community groups might be able to have standing and thus be able to launch suits against governments on behalf of the community's ecological rights.

Many industry supporters will contend that statute law is in place to protect ecological rights. In many cases, statute law may even contribute to the infringement and denial of ecological rights by creating the illusion that ecological rights are being protected when there is no institutional framework in place for protecting these rights. Although the Charter of Rights and Freedoms solely applies to the rights and freedoms of individuals vis-a-vis governments. It provides moral suasion and gives guidance to the courts where there are conflicts among individuals, community groups, industries and non-governmental institutions. Through articulating values, the Charter indicates to individuals, community groups, industries and non-governmental institutions the nature and extent of rights and duties and of moral and civil responsibility.

Significant changes to international law, charters and criminal law have often been initiated and justified when there is a convergence of international, national and local concerns about the rightness and necessity for the changes. This convergence now exists for the protection of ecological rights.

The Ecological Rights Association urges international bodies and national governments to consider the following proposed ecological rights -- the right to a safe environment and the right to an ecological heritage, and the right to not have present activities compromise the needs of future generations. The 'right to a safe environment' could lead to stringent regulations on the introduction of potentially harmful factors or substances into the economic sphere. The onus of proof could then shift from the present situation whereby citizens, consumer advocates and environmental groups have to demonstrate that the introduction of a factor or substance will have deleterious consequences. Instead the manufacturers, industry and governmental institutions would have to demonstrate that the introduction of such factors or substances would not have deleterious consequences.

The 'right to an ecological heritage' could lead to the protection and preservation of ecosystems and biodiversity. The Charter should reflect concern for the protection of this right. International documents such as the Report of the 1972 United Nations Commission on the Environment (Stockholm Conference) established principles related to environmental heritage. At Stockholm, the international community established the principles that human rights exist "in an environment of a quality that permits a life of dignity and well-being and that man bears a solemn responsibility to protect and improve the environment for present and future generations

The Ecological Rights Association will work a) towards enshrining the right to a safe environment and the right to ecological heritage in the Canadian Charter of Rights and Freedoms (and in other National Charters or constitutions); b) towards the establishment of an institutional framework to ensure that these ecological rights are protected c) towards lobbying for the enshrinement of ecological rights in a UN Covenant for the Protection of Ecological Rights d) towards encouraging the Criminal Law reform Commission to proceed on their proposal to have the causing of serious ecological damage deemed to be a crime; e) towards ensuring that individuals and community groups will have some form of recourse through the legal system, such as injunctions, to address the infringement and denial of their ecological rights by industry and institutions; and f) towards compiling and categorizing definitions and descriptions of what would constitute ecological rights

Ecological rights must be enshrined and protected even if economic interests may need to be sacrificed.

( ) THAT in 1991, I wrote "United Nations may be in contravention of its own Charter" it was published Association in the Times Colonist.

EXHIBIT I have not found the op-ed ; perhaps it is in the times Colonist Archives

Until I find out what I wrote, I will hazard a guess. One thing I might have said is that the US bypassed chapter VI – the peaceful resolution of disputes and went straight to Chapter VII which is the one that is used by the US to claim legitimacy for a military invasion which the US did using November 29 1990 UNSC Resolution 678.

Canada became involved in The **Canadian** Armed Forces participation in the military efforts there would be code-named Operation Friction. **Canada's first** military contributions came at sea in August 1990, when three of our warships sailed to the **Persian Gulf** to be part of a Coalition fleet. The invasion happened on January 16 1991.

( ) 1991 February 16, 1991, I Helped organize Emergency Peace Walk in Victoria ; It became very difficult because Canada was now involved in the war and people resented our having a rally when Canada's military was involved. I seem to remember that about 3000 people showed up I was walking along Douglas street and handing out leaflets and asking if people could attend the rally and I remember that a man spat at me.

( ) THAT in 1991, I helped the Sierra Club (Victoria Group) organize a tour of the Carmanah Valley for Jup Weber Green party Parliamentarian from Luxembourg who was elected to the European Parliament

#### COMMENT

He was taken to inspect the research station that was set up by the Western Wilderness Committee in the Carmanah Valley. Jup Weber climbed up a Sitka Spruce and hoisted us up to the first platform in the Canopy. This platform was large enough for several people; the next

platform was only a couple of feet. I began to feel agoraphobia, and froze. People walked by me to the third platform. I was told that I could only fly with the crows while the others could fly with the eagles. David sent out a press release about his visit and about the low percentage of old growth left.

( ) THAT in 1991 drafted a submission on the need to include the right to a safe environment and to ecological heritage into the UN Convention on the Rights of the Child

( ) THAT in 1991, I Submitted a formal request to the Ombudsman's office to investigate the Ministry of Forest's violation of section 59 and 60 of the Forest Act

( ) THAT in 1991, I Presented a paper on the "Epistemic mode of expression and interaction: the use of epistemological editorial symbols" to the Canadian Society for Studies in Education at the Learned Societies Conference, Kingston, Ont.

( ) That I attended Dr Ken Hewlett's presentation, which inspired me to coin the term ""Systemic Constraints" and its application to preventing change; (the guaranteeing of human rights; the ensuring of social justice; the protecting of the environment; the preventing of war and conflict) [a book which is still in progress].

DOCUMENT:

( ) THAT in 1991, at the Learned Societies , I intervened at a session on Development

COMMENT

NEED TO REDEFINE WHAT CONSTITUTES DEVELOPMENT Presented the concept at one of the sessions at the Learned Societies. I proposed that either the term "development" should not be used or the term needs to be redefined in terms of ethics, ecology, equity. Without a positive definition of "development" the US and Canada could conceivably be the least developed countries.

( ) THAT in 1991, I worked on a draft proposal for an Alternative Earth Charter or submission to UNCED and submitted the proposal to the Royal Society as part of their 1991 "Global Change" Conference proceedings.

Anecdote. Alastair Taylor

(..) THAT, in June 1991 attended the Global Change Conference organized by the Royal Society, at the Kingston, Learned Societies and undertook to draft a proposal for a Charter for the upcoming conference in Rio by preparing and proposing a UN Charter to "Address Potential Environmental Irreversibility" using the summary recommendations of the Royal Society Conference on the Global Environment( 1991)

COMMENT

I decided to attend the Royal Society Conference on Global Change. The president, Digby McLaren spoke and affirmed that what is needed is synthesis of existing research;. Inaction is negligence. After he completed his introduction, I intervened and made a comment that was: Is UNCED going to be yet another conference that deludes citizens into thinking that there would be fundamental change? Could we propose a Charter addressing the issues of Ecological irreversibility, and propose

that for UNCED? After I asked the question, someone behind me caught my attention and commented on my question. There were about 400 people in the room, and there was dead silence because Digby McLaren had responded to my question by saying, "would you like to draft such a document for the Royal Society?" Never having been asked to do anything for the Royal society before, I immediately said yes.

I met with he and Alastair Taylor to discuss the project. Alastair Taylor, professor Emeritus, [he said he was in his "anecdote"; something I then adopted ]. When he was 21, he wrote a text on world History which is still being used in first year history classes.

I told them that I had taken extensive notes at the Royal Society conference and that I thought many of the comments by the scientists could be a beginning for a preamble to a Charter.

I needed a ride to Toronto and asked if there was anyone driving to Toronto. I was told that Michael Ignatieff who had spoken at the conference would be driving in a limousine to Toronto and I could get a ride with him . I had never met him, but his family lived across the street from my family in .Ottawa. We took off in a long white limousine and I was dropped off looking like a bag lady on Bloor and Bathurst. I had to go to a meeting of the Canadian Voice of Women in Toronto.

( ) THAT in 1991 at one of the sessions at the Learned: a session on Women's issues related to Menopause, I met a women who invited me to go to Montreal after Toronto . When I was in Montreal I went to the archives to find out about the Perraults. When I mentioned to the archivist that I was related to Maurice Perrault the architect of the Hotel de Ville, he asked me initially if I was the mysterious woman from the Perrault family who had appeared with Maurice Perrault senior plans of Montreal for a special exhibition on the Perraults. He mentioned that it was a coincidence because two weeks ago, someone had handed him a monograph on the Perraults; and that there was always an architect in the Perrault family. I responded that I had studied architecture for three years in Europe and that I had never met any of my French relatives and would like to go through the records to see where that side of my family came from in France.

( ) THAT S1991 August 17, 24, 31

; • Helped Conservation Chair, David White, for Victoria Group of the Sierra Club to organize trips of Community leaders up to the Walbran ( 1991)

We compiled a long list of community groups and invited each group to send one representative. WE had a full bus each time.

• Helped organize tours of community leaders to visit the old growth forest in the Walbran

First trip

2nd trip . David Turner, Heifflefinger wandered off. Held up the bus. David stayed behind to look. Went on to report to the police.

third trip NDP MLAs: Andrew Petter, Rick Caspar, Elisabeth Cull, We went in a mini bus.

Moe Sihota was supposed to come but he missed the ferry from Vancouver.

Andrew Petter and Rick Caspar condemned the current forest practices  
• 1991. Assisted the Sierra Club (Victoria Group) in organizing tours of community leaders and elected officials up to the old growth forest in the Walbran

September 21 1991 - Fletcher Challenge petition

### **September 20, 1991**

• 1991-92 Co-organized. with David White, Community meetings at Spectrum Community school on the I wrote a draft following issues Indigenous issues, Forestry, Sewage, transportation, Nuclear powered and nuclear capable vessels, Todd inlet, transportation, sewage

#### **Press clipping about David in the paper**

( ) THAT 1992, I wrote a draft of the UN COVENANT FOR THE PROTECTION OF ECOLOGICAL RIGHTS

#### EXHIBIT

(U.N. CHARTER OF MUTUAL INTERDEPENDENCE : DECLARATION FOR THE PREVENTION OF THE STATE OF ECOLOGICAL IRREVERSIBILITY. UNIVERSAL DECLARATION OF HUMAN RESPONSIBILITY AND ECOLOGICAL RIGHTS.)

#### Preamble:

- Whereas researchers from the international community recognize that there is enough scientific information available to indicate that the world is moving towards a state of ecological irreversibility.
- Whereas researchers from the international community recognize that "multiple effects resulting from empirical observations are sufficient to justify and demand immediate action".
- Whereas researchers from the international community deem that society has enough information about the pending ecological disasters now that failure to act to address the pending disasters could be construed as [criminal] negligence.
- Whereas researchers from the international community recognize that never have so many potential and actual ecological disasters been converging. The ecological disasters are of "synergy complicity" synergistic proportions.
- Whereas researchers from the international community recognize that not only the actual and potential impact of independent ecological disasters warrants urgent attention but also the potential accumulative and synergistic impact of the converging of these independent ecological disasters requires urgent action The potential accumulative and synergistic impact is unpredictable, indeterminate and uncertain. In the face of this unpredictability, indeterminacy and uncertainty, caution is deemed to be the

only prudent action. " We are into fields where some of us as experts are all groping" "no one can prove that we have not had significant warning. Caution is of the essence".

- Whereas a significant segment of the international community acknowledges that because of the state of urgency new principles related to ecologically sound human behaviour must be established.
- Whereas the international community has enough information about the pending state of ecological irreversibility and about the full complexity and interdependence of the deterioration of the ecosystem that failure to act could be construed as criminal negligence.
- Whereas the international community recognizes the interdependence of a wide range of aspects that contribute to the state of ecological reversibility.
  - The refusal of "independent states" to accept the jurisdiction of international law
  - The escalation of arms production
  - The reluctance to arms reduction
  - The violation of human rights
  - The perpetuation of intolerance under the guise of the right to freedom
  - The irresponsible contribution to world population
  - The disregard for inequitable distribution of resources
  - The lack of political will to make unpopular but necessary decisions
  - The fragmentation of the decision making process
  - The perpetuation of systemic constraints preventing ecologically sound practices
  - The promulgation of non-ecological notions of what constitutes development (according to non-ecological notions of "progress')
  - The justification and rationalization of non-ecological practices
- Whereas the international community that does not have a vested interest in the economic benefits of continued development "recognize that the planet is disastrously over-developed".
- Whereas the purported resiliency of the planet within geological time should not be used to support the notion that the continued abuse of the ecosystem should be permitted.
- Whereas the researchers and concerned members of the international community recognize that the state of irreversibility will affect the quality of life of future generations.
- Whereas the researchers and concerned members of the international community recognized the importance of "linking research to policy".

*Urge the interdependent international community to adhere to the following ecological principles (Suggested principles that could be enshrined in a U.N. Charter to prevent the state of ecological irreversibility).*

- to acknowledge the interdependence of principles that need to be in place if there is to be a solution ( unacceptability of "short term" solutions based on fragmentation of the problem)
- to change values and "to recognize that we are all part of the problem" •to recognize and enshrine the right to a safe ecosystem
- to encourage the moral and ethical responsibilities concomitant on the protection of the right to a safe ecosystem
- to disallow acts contributing to ecological irreversibility
- "to limit human impact on the living world to carrying capacity" preserve biodiversity; equitable distribution of resources; cut back on use of resources
- to decrease population of fauna to keep within carrying capacity of the ecosystem
- to reduce the accelerative destruction of the habitat by reducing the use of fossil fuels
- to place restrictions on aesthetic or medicinal uses of fauna that could lead to species impoverishment
- to reexamine the practice of genetic engineering
- to redefine the notion of state autonomy in international law: No state can claim state sovereignty as a means of absolving them from being tried condemned and convicted of contributing to ecological irreversibility
- to empower the U.N. and its agencies) to prevent environmental degradation. This empowerment implies a substantial rethinking of the concept of sovereignty of nation states. Multinational Corporations must also be regulated by international agencies to prevent environmental degradation through ecologically unsound practices.
- to institute international control over the safety of products and over international standards related to ecologically sound practices
- to condemn the exporting of products or services that are deemed to be unsafe in the countries with high restrictions or regulation to other countries with more relaxed regulations ( because of their inability to test these products and because of their economic need prevents them from paying for more expensive and safer substitutes)
- to demand that "caution should be exercised when there is doubt about the impact of development
- to ensure that ecologically sound principles are driving industry not industry driving principles
- to advocate the shift in onus of proof from those opposing the intervention "having to demonstrate that the intervention will cause harm" to those advocating the intervention "having to demonstrate that their intervention will not cause harm.
- to relax the traditional requirement for conclusive evidence of the potentially irreversible nature of an intervention
- to reassess what constitutes "intention" in international, national, and local offenses related to the contribution to deleterious ecological effects

- to establish a new criterion for demonstrating intention " if evidence ( not necessarily conclusive) indicates doubt about the ecological safety of the intervention, and if the advocate of intervention intervenes in the environment, knowing that there is some doubt about the effects of the intervention, then the intervener could be construed as intending the effects of the intervention
  - to ensure that remuneration should only be paid for work that is ethical ( i.e. that it does not contribute to ecological irreversibility or ecological privation)
  - to require 'participant" science and technology to assess the full impact of introducing an intervention ( new products etc.) into the ecosystem
  - to recognize that simply the possibility of creating new technology should not justify the creation of the technology. (restraint)
  - to resist the temptation to accept non-ecologically sound projects because funds from these projects could be allocated for humanitarian projects
  - to ensure that the public is fully aware of the ecological consequences of an intervention
  - to ensure that the public is not presented with alternatives that do not address the ecological implications of the decisions
  - to disallow the rationalizing away of potentially harmful impact on the ecosystem through the guise of altruism or necessity
  - to prevent the perpetuation of systemic constraints (institutional and attitudinal ) that prevent ecologically sound practices
- to recognize, "unmask" name and identify constraints that are preventing ecological sound practices in the international, national and local communities
  - to unmask systemic constraints preventing ecological change.
    - Collusive public process ( government agencies are working with industry)
    - Delusion of public process ( the public hearing, not a listening or an attending to)
    - Counter-argument retrieval device ( the public hearing where the decision maker have the opportunity to collect data from the interveners for future rebuttals)
    - Ineffectual time of intervention for interveners
    - Premature terms of reference
    - Feigned alternatives
    - Visual misrepresentation
    - Misplaced onus of proof
    - Altruistic concerns misconstrued and categorized as interest groups
    - Presumption and perpetuation of the remedial technological fix
    - Presumption that the system that generated harm is the only one capable of addressing and redressing the harm
    - "Now we know better but what can we do " device ( We recognize that we have destroyed a large segment of the "old growth forest but if we no longer log the old growth forest , the forest industry will shut down)
    - Assumption that methodology that worked in the past will still be effective today

- Failure to recognize that situation has changed so substantially that new modes are required to bring about change
- "Seductive posture" "sustainable development- prescription for continuous rape" (K.H. )
- Unwillingness to redefine progress as being integration and interdependence not imposition and exploitation
- Confusion between tenability and non-tenability
- Confusion between fairness and "objectivity" in research
- Avoidance of obvious but unpopular inconsistencies
- Influential use of violation of principle( compromise) couched in euphemistic terms
- Presume rigour of fragmented studies
- Unwillingness to confront complexity
- Media segmentation of issues without reinserting them into the continuous interacting and interdependent plane of outstanding unresolved and resolved issues
- Absence equated with presumed resolution "out of mind"
- Appeasement of international conferences
- Complacency through authority
- Ineffectiveness of international organizations
- Susceptibility of international organizations to being usurped by dominant states
- Illusive substantive change ( token change)
- Perception superseding substance
- Dire consequences strategy
- Euphemistic designations ( "share the forests" --loggers and industry)
- Disguised concerns expressed in palatable altruistic terms (jobs)
- Legitimized rationalization. Rationalization and justification as inhibitors of change.
- Feigned altruism
- Condoned myopia (unwillingness to link development and disasters , K.H.) )
- Addiction to consumption ( S.)
- Collective forgetfulness (K.H.)
- Justification of unethical acts because revenue can be used for
- Beneficial purposes
- System inertia (S.W)
- Endemic inertia
- Syndrome of expedient omission
- Calculated diversion (While the ecological community is protesting the destruction of one old growth valley, the forest industry continues to destroy many others)
- Cult of the model
- Laughter of squeamishness (When criticized the perpetrators of the problem laugh as though they were exempt from the criticism and then continue to perpetuate the problem)
- Rationalized non-involvement
- Tenacity of convenience

(Systemic constraints derived from a paper in progress by White (ecologist and educator) and Russow, doctoral candidate in interdisciplinary studies) with contributions from Scott Wakeman (graduate in Philosophy), and Ken Hewitt (Professor of Geography)

- to reassess what is or is not acknowledged, enshrined and guaranteed as rights and to extend the "rights" to include a set of rights related to the ecosystem
  - to enshrine the right to a safe ecosystem
  - to enshrine the right of future generation to their ecological heritage
  - to enshrine the right of future generation to biodiversity
  - to acknowledge that the ecosystem itself has inherent rights beyond those serving the human purpose
  - to enshrine positive rights, such as right to ecological sound work, right to housing, right to food, right to an equitable distribution of resources...
  
- to prohibit the production of weapons of mass destruction and work towards the control over other weapons and towards eventual disarmament.
  
- to ensure that models, distinctions and categories are not presumed to reflect reality or determine or predetermine "human reality" (Eurocentric perspectives)
- to encourage the responsible use of the land: reduction of use of harmful pesticides and excessive use of natural resources
- to disallow acts contributing to ecological irreversibility in lands over which there are current disputes of ownership

## NOTICE OF MOTION

( ) THAT On July 18, 1991, I filed a notice of Motion Re: Injunction issued to Fletcher Challenge

July 18, 1991

### EXHIBIT: NOTICE

We applied for leave to respond to the order of Mr Justice Errico on the above named matter. We would like to appear on the grounds that the Mr Justice Errico may have based his decision on misleading information appearing in the information provided in the affidavit accompanying Fletcher Challenges' application for an injunction.

### APPLICATION OF MOTION

We apply for leave to request an interlocutory injunction pending the consideration of a permanent injunction against the logging of the remaining unfragmented old growth forests in B.C. and against the ecologically unsound logging of the fragmented old growth forests in B.C.. We also request that the court order the chief forester to make an inventory of the existing forests as is required in the Forestry Act, and do an assessment for the public of the status of regeneration of the second growth forests.

We request this injunction for the following reasons:

1. There is evidence that the Ministry of Forests may have been misled by the forestry Companies. when the forestry companies applied for and reapplied for tree farm licenses.
2. There is evidence that the public has been misled by the public viewings of the development and management plans of the tree farm licensees.
3. There is evidence that continuing to engage in extensive road building and clearcut logging in these old growth areas could cause irreparable harm and that, if it can be shown that the companies obtained the privilege of logging in crown land as a result of submitting misleading information, then the potential irreparable harm should cease until the question about misleading information can be addressed.
4. In the August 1991 updated of "the conduct of Civil Litigation in B.C. the following principle related to injunctions is put forth:

"The remedy [of injunction] of course, is an equitable one. ' The exercise of the equitable jurisdiction is not to be restricted by the straitjacket of rigid rules but is to be based on broad principles of justice and convenience, equity regarding the substance and not merely the facade or the shadow. It moves with time and

circumstances. (Norris, J.A.) Equity is not to be presumed to be of an age past childbearing.' (Haman, J) " (Conduct of Civil Litigation in B.C., Chapter 42, August, 1991).

If a remedy of an injunction is an equitable remedy that should move with time and circumstances, there is evidence that time and circumstances have changed:

- 4.1. evidence from the international and national scientific community of the necessity of preserving intact ecosystems and representative samples of natural ecosystems.
- 4.2 evidence from the international, national and provincial legal community of the need to recognize "ecological rights"
- 4.3. evidence that 'ecological rights' have been protected in international charters and covenants that have been ratified by Canada
- 4.4. evidence from the international community that violation of ecological rights should be considered under either international law or under National Charters
- 4.5. evidence from the international community that in cases involving ecological rights decisions must be made on the basis of principle not political and economic expediency  
see enclosed affidavits
  1. related to the way forest companies have misled the government the courts and the public
  2. related to the way the Ministry of Forestry has misled the public
  3. related to nature of ecological rights and of the need to recognize and protect ecological rights

( ) THAT in July 1991, I drafted and circulated U.N. **Charter of Mutual Interdependence: Declaration for the Prevention of the State of Ecological irreversibility.**

### **Universal Declaration of Human Responsibility and Ecological Rights.**

This Charter was made into an ideagraph and passed on to Noel Black, Director of the United Nations Environment Programme (UNEP) at the 1992 Globe Conference in Vancouver, and circulated at lead-up conferences to UNCED, the Prep Com and at UNCED.

### EXHIBIT

( ) **THAT** from 1991-1994, I was on the Board of Directors of the Vancouver Island Peace Society - the Society that launched a case against the circulating in ports and the berthing of nuclear powered and nuclear-arms capable vessels in the Greater Victoria harbour. The Federal government issued an Order in Council to bypass its statutory law, EARP guidelines, Eventually the Court concurred with the Federal Government that it was legitimate for the government to use Royal Prerogative to bypass statutory law.

( ) **THAT** in 1991, I was on the committee that organized an Emergency Peace Walk; I designed the flyer and my son Lorick wrote a song.

#### COMMENT

There was a wide range of opposition to the emergency Peace walk: Especially because Canada was already in the war and there was a resurgence of nationalism. I would walk along Government Street and ask people if they are going to be going to the emergency Peace walk. There was also opposition from the Peace Walk committee; one person said there would not be time for all the accoutrements, such as face painting of the annual Peace Walk.

( ) THAT in 1991, I had written a paper that was accepted at the Learned in Kingston

kingston1991 Presented a paper on the "Epistemic mode of expression and interaction: the use of epistemological editorial symbols" to the Canadian Society for Studies in Education

kingston1991 Presented a paper on the "Epistemic mode of expression and interaction: the use of epistemological editorial symbols" to the Canadian Society for Studies in Kingston.

( ) **THAT** in 1991 at the Learned's, I attended an international Conference organized by the Royal Society of Canada's forum at the Learned Societies Annual General meeting, I intervened and proposed that the Royal Society draft a Charter to address ecological irreversibility.

There is a strong indication from statements from international documents, and from experts that there is an urgency to address the global environmental situation, and that "inaction is negligence" (Digby McLaren, Past President of the Royal Society of Canada, Keynote address, Global Issues Conference, 1991).

In 1991, attend the Royal Society Conference on Global Change. The president Digby McLaren spoke and affirmed that what is needed is synthesis of existing research. Inaction is negligence. After he completed his introduction, I intervened and made a comment that "was this going to be yet another conference that deluded citizens into thinking that there would be fundamental change: Could we propose a Charter addressing the issues of Ecological irreversibility, and propose a charter for UNCED?" After I asked the question, someone behind me caught my attention and commented on my question. There were about 400 people in the room, and there was dead silence because Digby McLaren had responded to my question by saying would you like to draft such a document for the Royal Society. Never having been asked to do anything for the Royal society, I immediately said yes, and spent the Summer of 1991 drafting a Charter

At the conference, one speaker after another addressed the urgency:

#### *Exponential growth*

- *Increased depletion of the ozone layer exceeds all predictions*
- *increased species impoverishment*

- *extinction which is a natural process. cannot use as an excuse for what we are doing to diversity*
- *Increased loss of species habitat*
- *Fragmentation of habitats*
- *Decreasing biodiversity*
- *Increased species impoverishment*
- *Increased deforestation*
- *Increased loss of temperate and tropical rain forests*
- *Increased loss of carbon sink*
- *Increased desertification*
- *Increase in population beyond the carrying capacity*
- *Increase in inequitable distribution of resources*
- *Increased technological malfunctioning*
- *Increased dependency on fossil fuels*
- *Increased energy production and consumption*
- *Increased expenditure of resources and human ingenuity on short term solutions*
- *Increased susceptibility to ecological disasters as development increases*
- *Increased susceptibility to ecological disasters as terrorism increases*
- *Increased production of waste*
- *Increased difficulty of waste disposal*
- *Reduction of capacity to defend itself*
- *Increased "global imbalance" re. hydroxide*
- *Increased "concentration of carbon dioxide*
- *Long residue time of chemicals re. cfc*
- *Increased potential of global warming*
- *Increase in greenhouse effect*
- *Increased destruction through acid rain*
- *Increased extraction of chemicals*
- *Increased transportation of chemicals*
- *Increased refinement of chemicals*
- *Increased disposal of chemicals*
- *Increased persistence of chemicals*
- *Increased bioaccumulation of chemicals*
- *Increased biomagnification of chemicals*
- *Increased dispersal of toxic and hazardous chemicals into the ecosystem*
- *increased exposure to chemicals*
- *Increased entry into the food chain of deleterious chemicals*
- *Increased impact of environmentally induced toxins*

(From my notes: "Identification of urgency of global situation at "Global Change Conference,"

sponsored by the Royal Society of Canada, at Learned's, Kingston 1991)  
 When I returned to Victoria and spent the summer working on collaboration with Allister Tayler, a member of the Royal society on a draft charter.

**( ) THAT in 1991, I submitted a Draft :UN Charter of Mutual Interdependence: Declaration for the Prevention of the State of Ecological Irreversibility. Universal Declaration of Human Responsibility and Ecological rights.**

By Joan Russow, Doctoral Candidate at the University of Victoria and co-founder of the Ecological Rights Association

Preamble:

- Whereas researchers from the international community recognize that there is enough scientific information available to indicate that the world is moving towards a state of ecological irreversibility
- Whereas researchers from the international community recognize that "multiple effects resulting from empirical observations are sufficient to justify and demand immediate action"
- Whereas researchers from the international community deem that society has enough information about the pending ecological disasters now that failure to act to address the pending disasters could be construed as [criminal] negligence
- Whereas researchers from the international community recognize that never have so many potential and actual ecological disasters been converging. The ecological disasters are of "synergy complicity" synergistic proportions.
- Whereas researchers from the international community recognize that not only the actual and potential impact of independent ecological disasters warrants urgent attention but also the potential accumulative and synergistic impact of the converging of these independent ecological disasters requires urgent action The potential accumulative and synergistic impact is unpredictable, indeterminate and uncertain. In the face of this unpredictability, indeterminacy and uncertainty, caution is deemed to be the only prudent action. " We are into fields where some of us as experts are all groping" "no one can prove that we have not had significant warning. Caution is of the essence".
- Whereas a significant segment of the international community acknowledges that because of the state of urgency new principles related to ecologically sound human behaviour must be established.
- Whereas the international community has enough information about the pending state of ecological irreversibility and about the full complexity and interdependence of the deterioration of the ecosystem that failure to act could be construed as criminal negligence.
- Whereas the international community recognizes the interdependence of a wide range of aspects that contribute to the state of ecological reversibility.
  - The refusal of "independent states" to accept the jurisdiction of international law
  - The escalation of arms production
  - The reluctance to arms reduction
  - The violation of human rights
  - The perpetuation of intolerance under the guise of the right to freedom
  - The irresponsible contribution to world population
  - The disregard for inequitable distribution of resources
  - The lack of political will to make unpopular but necessary decisions

- The fragmentation of the decision making process
- The perpetuation of systemic constraints preventing ecologically unsound practices
- The promulgation of non-ecological notions of what constitutes development  
(according to non-ecological notions of "progress')
- The justification and rationalization of non-ecological practices

- Whereas the international community that does not have a vested interest in the economic benefits of continued development "recognize that the planet is disastrously over-developed".
- Whereas the purported resiliency of the planet within geological time should not be used to support the notion that the continued abuse of the ecosystem should be permitted.
- Whereas the researchers and concerned members of the international community recognize that the state of irreversibility will affect the quality of life of future generations.
- Whereas the researchers and concerned members of the international community recognized the importance of "linking research to policy".

*Urge the interdependent international community to adhere to the following ecological principles (Suggested principles that could be enshrined in a U.N. Charter to prevent the state of ecological irreversibility).*

- to acknowledge the interdependence of principles that need to be in place if there is to be a solution ( unacceptability of "short term" solutions based on fragmentation of the problem)
- to change values and "to recognize that we are all part of the problem" •to recognize and enshrine the right to a safe ecosystem
- to encourage the moral and ethical responsibilities concomitant on the protection of the right to a safe ecosystem
- to disallow acts contributing to ecological irreversibility
- "to limit human impact on the living world to carrying capacity"
- preserve biodiversity; equitable distribution of resources; cut back on use of resources
- to decrease population of fauna to keep within carrying capacity of the ecosystem
- to reduce the accelerative destruction of the habitat by reducing the use of fossil fuels
- to place restrictions on aesthetic or medicinal uses of fauna that could lead to species impoverishment
- to re-examine the practice of genetic engineering

- to redefine the notion of state autonomy in international law: No state can claim state sovereignty as a means of absolving them from being tried, condemned and convicted of contributing to ecological irreversibility
- to empower the U.N. and its agencies) to prevent environmental degradation. This empowerment implies a substantial rethinking of the concept of sovereignty of nation states. Multinational Corporations must also be regulated by international agencies to prevent environmental degradation through ecologically unsound practices.
- to institute international control over the safety of products and over international standards related to ecologically sound practices
- to condemn the exporting of products or services that are deemed to be unsafe in the countries with high restrictions or regulation to other countries with more relaxed regulations ( because of their inability to test these products and because of their economic need prevents them from paying for more expensive and safer substitutes)
- to demand that "caution should be exercised when there is doubt about the impact of development
- to ensure that ecologically sound principles are driving industry not industry driving principles
- to advocate the shift in onus of proof from those opposing the intervention "having to demonstrate that the intervention will cause harm" to those advocating the intervention "having to demonstrate that their intervention will not cause harm.
- to relax the traditional requirement for conclusive evidence of the potentially irreversible nature of an intervention
- to reassess what constitutes "intention" in international, national, and local offenses related to the contribution to deleterious ecological effects
- to establish a new criterion for demonstrating intention " if evidence ( not necessarily conclusive) indicates doubt about the ecological safety of the intervention, and if the advocate of intervention intervenes in the environment, knowing that there is some doubt about the effects of the intervention, then the intervener could be construed as intending the effects of the intervention
- to ensure that remuneration should only be paid for work that is ethical ( i.e. that it does not contribute to ecological irreversibility or ecological privation)
- to require 'participant" science and technology to assess the full impact of introducing an intervention (new products etc.) into the ecosystem
- to recognize that simply the possibility of creating new technology should not justify the creation of the technology. (restraint)
- to resist the temptation to accept non-ecologically sound projects because funds from these projects could be allocated for humanitarian projects
- to ensure that the public is fully aware of the ecological consequences of an intervention
- to ensure that the public is not presented with alternatives that do not address the ecological implications of the decisions
- to disallow the rationalizing away of potentially harmful impact on the ecosystem through the guise of altruism or necessity

- to prevent the perpetuation of systemic constraints (institutional and attitudinal ) that prevent ecologically sound practices
- To recognize, "unmask" name and identify constraints that are preventing ecological sound practices in the international, national and local communities
- to unmask systemic constraints preventing positive ecological change.

- Collusive public process ( government agencies are working with industry)
- Delusion of public process ( the public hearing, not a listening or an attending to)
- Counter-argument retrieval device ( the public hearing where the decision maker have the opportunity to collect data from the interveners for future rebuttals)
- Ineffectual time of intervention for interveners
- Premature terms of reference
- Feigned alternatives
- Visual misrepresentation
- Misplaced onus of proof
- Altruistic concerns misconstrued and categorized as interest groups
- Presumption and perpetuation of the remedial technological fix
- Presumption that the system that generated harm is the only one capable of addressing and redressing the harm
- "Now we know better but what can we do " device ( We recognize that we have destroyed a large segment of the "old growth forest but if we no longer log the old growth forest , the forest industry will shut down)
- Assumption that methodology that worked in the past will still be effective today
- Failure to recognize that situation has changed so substantially that new modes are required to bring about change
- "Seductive posture" "sustainable development- prescription for continuous rape" (K.H. )
- Unwillingness to redefine progress as being integration and interdependence not imposition and exploitation
- Confusion between tenability and non-tenability
- Confusion between fairness and "objectivity" in research
- Avoidance of obvious but unpopular inconsistencies
- Influential use of violation of principle( compromise) couched in euphemistic terms
- Presume rigour of fragmented studies
- Unwillingness to confront complexity

- Media segmentation of issues without reinserting them into the continuous interacting and interdependent plane of outstanding unresolved and resolved issues
- Absence equated with presumed resolution "out of mind"
- Appeasement of international conferences
- Complacency through authority
- Ineffectiveness of international organizations
- Susceptibility of international organizations to being usurped by dominant states
- Illusive substantive change ( token change)
- Perception superseding substance
- Dire consequences strategy
- Euphemistic designations ( "share the forests" --loggers and industry)
- Disguised concerns expressed in palatable altruistic terms (jobs)
- Legitimized rationalization. Rationalization and justification as inhibitors of change.
- Feigned altruism
- Condoned myopia (unwillingness to link development and disasters , K.H.) )
- Addiction to consumption ( S.)
- Collective forgetfulness (K.H.)
- Justification of unethical acts because revenue can be used for
- Beneficial purposes
- System inertia (S.W)
- Endemic inertia
- Syndrome of expedient omission
- Calculated diversion (While the ecological community is protesting the destruction of one old growth valley, the forest industry continues to destroy many others)
- Cult of the model
- Laughter of squeamishness (When criticized the perpetrators of the problem laugh as though they were exempt from the criticism and then continue to perpetuate the problem)
- Rationalized non-involvement
- Tenacity of convenience

(Systemic constraints derived from a paper in progress by White (ecologist and educator) and Russow, doctoral candidate in interdisciplinary studies) with contributions from Scott Wakeman ( graduate in Philosophy), and Ken Hewitt (Professor of Geography)

- to reassess what is or is not acknowledged, enshrined and guaranteed as rights and to extend the "rights" to include a set of rights related to the ecosystem
  - to enshrine the right to a safe ecosystem
  - to enshrine the right of future generation to their ecological heritage
  - to enshrine the right of future generation to biodiversity
  - to acknowledge that the ecosystem itself has inherent rights beyond those serving the human purpose
  - to enshrine positive rights, such as right to ecological sound work, right to housing, right to food, right to an equitable distribution of resources...
  
- to prohibit the production of weapons of mass destruction and work towards the control over other weapons and towards eventual disarmament.
  
- to ensure that models, distinctions and categories are not presumed to reflect reality or determine or predetermine "human reality" ( Eurocentric perspectives)
- to encourage the responsible use of the land: reduction of use of harmful pesticides and excessive use of natural resources
- to disallow acts contributing to ecological irreversibility in lands over which there are current disputes of ownership

( ) THAT from September 1991 - June 1992, I initiated and participated in the planning "clean air/car-free day" to coincide with the opening of UNCED, and to implement the spirit of the Climate Change convention.

COMMENT:

• in 1991 I Initiated the concept of a car-free day at a public meeting with local mayors on "car-dependency." I told the meeting that in the 1970s I took part in Ottawa car free-day; in Ottawa no cars were allowed in the city. I also proposed that there could be rotating car free days in the different municipalities in greater Victoria; a committee was struck; my role was to find out about the details in Ottawa and over a period of months we met and finally "Car free/clean air free day in Victoria ( 1992) to co-incide with the opening of UNCED on June 2, 1992. David Turner issued a proclamation and I designed posters to promote "Car free/clean air day in Victoria (1992).

I was away in Rio when Car-free day happened. It was anticlimactic. Primarily a photo- op for members of different ministries. There appeared to be a lot of opposition to the notion of Car-free from merchants and suddenly it became "car pooling." I had suggested that anyone who drove a car on that day should be issued a ticket which would condemn him or her to have to walk down Blanshard --a busy street in Victoria- between 4 -6pm. After 1992, June 3rd became Clean Air Day and car-free was dropped and somewhat revived recently.

THAT in 1991, we submitted a Proposal for "Year 2000 Documents; Curricular Integration." (J.Russow and (D. White. (1991).

( ) THAT on October 30, 1991, I filed an affidavit for the court case calling for an environmental assessment review of the berthing of nuclear powered and nuclear -arms capable vessels in the harbour of Greater Victoria.

RESPONDENTS

---

**Annotated Index of Affidavits**

1. **IRENE LOUISE ABBEY:** Voice of Women for an environmental review. A three page summary by Dr. Jackson Davis, titled "Nuclear Accidents on Military Vessels in Canadian Ports: Site - Specific Analyses for Esquimalt/Victoria" is appended as Exhibit "A".
2. **NORMAN E. ABBEY:** A peace worker with the Nanoose Conversion Campaign, etc. Norm Abbey's affidavit describes the work over time of the Nanoose Conversion Campaign, and their study of the dangers these ships bring us. His affidavit also describes the secrecy and stifling of public discussion by the Defence Ministry.
3. **ALISON ACKER:** A member and frequent songwriter for the Victoria Raging Grannies, she is a neighbour and kayaker directly across the harbour from CFB Esquimalt's docks used for nuclear and other warships. Among other concerns of Alison Acker is the leaking of nuclear coolant into the harbour. Exhibit "A" to Alison's affidavit is the November 28, 1991 Times Colonist article on the USS Longbeach, titled "Leaks from U.S. nuke ship 'prove visits here unsafe'".
4. **ROSALIE BERTELL:** A distinguished Canadian radiation scientist specializing in low level radiation. Rosalie Bertell informs us that the permissible levels of radiation exposure for the general public, or for workers is currently in the process of being lowered to only 20% of what the government of Canada now permits yearly.
5. **JANE P. BRETT:** A peace worker and Chairperson of the Christian Social Action Committee of St. Aidan's United Church of Victoria. Jane Brett describes the public concern over nuclear war ships in our ports as evidenced during the last two federal elections in Saanich, British Columbia. She contrasts the relative attention our community pays to earthquake preparedness, to the lack of preparation and attention to preparation for a nuclear disaster.

6. **HELEN ELIZABETH BRIGHTWELL:** An author, Raging Grannie, and longtime resident of Esquimalt near the mouth of the harbour. Betty Brightwell's affidavit appends both CFB Esquimalt's "Nuclear Emergency Response Plan" and Esquimalt's recently passed "Emergency Plan". This affidavit critiques the inadequacies of those plans. It also contains research on the inadequacy of the Navy's water sampling for radioactivity leaks.
7. **JAN CHRISTILAW:** A physician and 10 year member of the Provincial Executive for the Canadian Physicians for the Prevention of Nuclear War. Appended to her affidavit is a paper she co-authored with University of British Columbia professor, Michael D. Wallace, titled, "Military Related Threats To The B.C. Environment". Dr. Christilaw describes the catastrophic effects on public health, both immediate and long term, in the event of a nuclear accident.
8. **BEVERLY EILEEN DAVIS:** A faculty member in the education department at Simon Fraser University and the President of the Peace and Global Education Provincial Specialist Association. Her affidavit describes the widespread fears of children concerning nuclear disasters and nuclear war. A letter from Prime Minister Mulroney to the schoolchild Natasha is attached with this Respondent acknowledging the public concern among children over the threat of nuclear destruction.
9. **PROFESSOR ERIC FAWCETT:** A Professor of Physics at the University of Toronto, and National Vice-President of Science for Peace. Dr. Fawcett described unbridled militarism as the greatest threat to humankind, and consuming financial and human resources needed to address the manifold current threats to the environment.
10. **SHIRLEY FYLES:** Friend of the Applicant Anne Pask, and a member of the Interfaith Peace Vigil and the Christian Social Action Committee of St. Aidan's United Church in Victoria. Shirley Fyles describes public concern with this issue, and her own personal interactions with a crew member of the U.S. nuclear submarine USS Aspro.
11. **DR. ANN GOWER:** Adjunct Associate Professor of Physics at the University of Victoria, and a longtime member of the Interfaith Peace Vigil. Dr. Gower describes the campaign of her group in displaying large yellow warning signs in homes and offices whenever a nuclear ship has come to local waters.
12. **NANCY E. GOLDSBERRY:** Farmer living in Coombs on Vancouver Island's east coast, north of Nanaimo. As an agriculturalist she writes of the interlocking web of life and the effects that radioactive contamination could have in our ecosystem.
13. **GREGORY P. HARTNELL:** An Applicant, longtime resident of Victoria, and the President of the Greater Victoria Concerned Citizens Association. Gregory Hartnell describes an environmental review as holding the opportunity for real security and not just empty words to the people of the capital region. He describes this issue as transcending partisan politics and commanding nearly unanimous public support.
14. **JAMES HELLER:** An articling student in the law office of Robert Moore- Stewart. His affidavit appends a February 3, 1992, letter from the local Songhees Indian Band, and signed by Chief Norman George

and Councillor Robert Sam. The Songhees Band's reserve is contiguous with Esquimalt and shares part of Esquimalt harbour. The Songhees Band supports a public review and a ban on the docking of nuclear-armed and/or -powered vessels in Esquimalt and Victoria harbours.

15. **MAJOR GENERAL LEONARD VERNE JOHNSON (ret):** Retired Major-General in the Royal Canadian Air Force, and retired Commandant of the National Defence College of Canada in Kingston, Ontario. Currently Leonard Johnson is a Director of the national organization Energy Probe, and the Chairperson of the national organization Project Ploughshares. Leonard Johnston confirms that there is no strategic military purpose served by the nuclear ship visits to Greater Victoria. He states that these visits are conducted for recreational or ceremonial purposes.
16. **PROFESSOR FREDERICK KNELMAN:** Author and Professor, with published research over decades on the subject of nuclear technology and its associated hazards. Dr. Knelman's has filed two affidavits, the first on November 22, 1991. Dr. Knelman's first affidavit goes through the literature concerning known accidents and accident rates for nuclear ships. Dr. Knelman points to the evidence of lying by the U.S. Navy concerning the reality of accident records of U.S. naval nuclear warships. He compares the public civil regulatory schemes for siting land-based nuclear reactors to the secrecy involved in these naval nuclear visits to urban ports. Dr. Knelman states that no civil nuclear reactor could be sited in or near the port of Esquimalt without a thorough public environmental review, even though naval nuclear reactors are inherently less safe than civil land-based reactors.
17. **PROFESSOR FREDERICK KNELMAN:** Dr. Knelman's second affidavit, filed January 29, 1992, furthers Dr. Knelman's reporting on naval nuclear reactor accident rates. He describes a near miss meltdown incident from January 26, 1988, aboard HMCS Resolution, a U.K. nuclear submarine, off the coast of Scotland. Dr. Knelman deals with President Bush's recent initiatives on naval arms control. He also discusses the indemnity policies of the U.S. Government regarding payment for nuclear accidents aboard U.S. naval warships.
18. **LAURIE J. MacBRIDE:** Formerly a full-time Campaigner with the Nanoose Conversion Campaign (1984-1990), and presently the Executive Director of the Save the Georgia Strait Alliance. Laurie MacBride describes the intense and sustained expressions of public concern over U.S. nuclear warships and their use of the Canadian Forces Base at Nanoose, Vancouver Island, and their transit in internal Canadian waters.
19. **JOHN MATE:** Full-time Campaigner with Greenpeace Canada in Vancouver. Mr. Mate headed Greenpeace Canada's Nuclear Free Seas Campaign from February 1989 to December 1991. Greenpeace research is presented showing that the world's nuclear navies suffered over 1200 accidents between 1945 and 1988, losing 48 nuclear warheads and seven nuclear reactors currently on the bottom of the world's oceans.

20. **JASON R. MILLER:** Student and former Canadian naval officer (1985-1991). He discusses his knowledge of U.S. "nuclear capable" ships from joint training exercises. Jason Miller discusses and attaches as exhibits news articles concerning U.S. Navy nuclear sailors who have gone public with their allegations of routine violations of safety standards, and leakages into ports of radioactive coolant.
21. **ANNE A. PASK:** An Applicant, Raging Granny, longtime worker for peace, and retired public health nurse. Anne Pask discusses her motivation leading her to become a party in this action. She discusses her work for peace on the Marshall Islands in 1984 aboard the Pacific Peacemaker. She further discusses her 1991 trip to Kiev, Ukraine, and the Chernobyl area.
22. **DR. ELINOR POWELL:** Retired physician, active member of St. John's Anglican Church Peace & Justice Committee, and Director of the Canadian Government-funded Canadian International Institute of International Peace & Security. Dr. Powell reviews some of the effects of radioactive contamination on a populated port city, and specifically Victoria and Esquimalt.
23. **BILL ROBINSON:** Full-time Researcher with Project Ploughshares, formerly with Operation Dismantle. Bill Robinson explains that the visits by the U.S. Navy to Esquimalt and Victoria are to "show the flag" and not for strategic reasons as they have close-by U.S. bases. While working with Operation Dismantle, Bill Robinson co-authored a booklet in 1986 called "Unsafe Harbours: Nuclear Weapons in Canadian Ports". Two pages of excerpts from this publication are contained as Exhibit "N" to the second affidavit of Al Rycroft.
24. **DR. PAUL ROSENBERG:** An Emergency Medicine Physician who works professionally, in part, in disaster planning. Dr. Rosenberg, while working for the Greater Victoria Hospital Society, evaluated for them the state of preparedness for accidents involving nuclear-powered and nuclear-armed warships at CFB Esquimalt. Dr. Rosenberg reports "the municipalities of Greater Victoria do not have disaster plans for nuclear accidents aboard visiting warships. They have been falsely assured by the Canadian Forces that adequate provisions have been made by their own Nuclear Emergency Response Team. There is no protection for the civilian population in the event of a serious nuclear accident."
25. **RAGING GRANNIES OF VICTORIA:** The Raging Grannies affidavit was signed by Lois Marcoux, Kathy Hall, Doran Doyle, Inger Kronseth, Mary Rose, and Hilda Marczak. This affidavit describes street theatre, sail-ins, and musical protests which the Grannies have been involved in on the subject of foreign nuclear warships in our ports and waters. One overwhelming truth comes from the Grannies' experience of reaching out and communicating on this issue with so many residents and citizens. The Grannies report that the great majority of Canadians are on our side on this issue.
26. **JOAN RUSSOW:** A Doctoral Candidate at the University of Victoria, in Interdisciplinary Studies. Joan Russow did a content analysis of eight federal statutes relating to nuclear regulation and the regulation of potential environmental contaminants. She picked out general principles from these Acts which support a common duty of public

review and full disclosure concerning activities threatening to the environment.

27. **AL RYCROFT**: A Director of the VIP Society, and formerly full-time Coordinator of the Greater Victoria Disarmament Group (1989-1991). Al Rycroft's first affidavit, filed November 22, 1991, deals with the demonstration and documentation of great public concern with this issue. The affidavit details the eight municipalities, all local Members of Parliament, Leaders of B.C.'s NDP and Liberal parties, and many non-profit organizations, who have openly called for a public environmental review of nuclear warship visits.
28. **AL RYCROFT**: Al Rycroft's second affidavit, filed February 12, 1992, attaches many Exhibits documenting the dangers of nuclear warship visits, and the public outcry and protest of their continued visits to Greater Victoria. He appends and discusses materials such as excerpts from the Greenpeace Neptune Papers titled "Naval Accidents 1945-1988 by William Arkin and Joshua Handler. He appends correspondence from B.C. Premier Mike Harcourt, from Victoria Member of Parliament John Brewin who is the Defence Critic for the NDP in Canada's Parliament. Both have been full and publicly supportive of the demand for a public environmental review of nuclear warship visits.
29. **COMMANDER ROGER D.C. SWEENEY (ret)**: A retired Canadian naval officer with 31 years' service (1950-1980). He concludes from his experience: "I know of no naval equipment or procedure which is totally 'sailor-proof'. Anything that can go wrong in a ship eventually will go wrong."
30. **MLA DOUGLAS SYMONS**: Member of the British Columbia Legislature for Richmond Centre, sitting for the Liberal Party of B.C. Douglas Symons has a long history as a respected peace activist. His affidavit states that the "public interest would be served by the holding of a public environmental assessment of the environmental consequences of nuclear- capable and nuclear-powered vessels visiting Victoria, Esquimalt and Vancouver areas."
31. **RACHEL STENBERG**: Full-time Volunteer Coordinator for the Greater Victoria Disarmament Group. Her affidavit gives a historical review of the work that the Disarmament Group has done over the years in public education and demonstration of public concern over nuclear warship visits. The letters by eight Greater Victoria municipal Councils requesting a public environmental review are attached to Rachel's affidavit. Other documentation showing widespread support for this public review is attached to this affidavit, including support letters from Members of Parliament Raymond Skelly, John Brewin, and Lynn Hunter. Representative letters are attached from organizations including the Victoria Labour Council, Sierra Club, and the Vancouver Island Network for Disarmament. Response letters from the Minister of National Defence and the Minister of Transport are also appended.
32. **BRUCE TORRIE**: A Lawyer who has spoken and corresponded with Admiral Robert Falls (retired), Commander of the Canadian Navy until 1976, and Canada's Chief of Defence Staff (1976- 1980). Admiral Falls states in his letter: "I can see no valid reason not to have an

environmental review of the subject to clearly establish the degree of risk involved in such visits. Security reasons are surely becoming more and more irrelevant as the cold war becomes colder and deader. I therefore wish you well in your quest."

33. **MAYOR DAVID TURNER:** The Mayor of Victoria was authorized to submit an affidavit, on behalf of Council, by a January 16, 1992, resolution of Victoria City Council. The affidavit states that "City Council continues to have concerns for public safety" and is in support of a "public environmental assessment review of visits to Victoria and Esquimalt harbours by nuclear-powered and nuclear- armed ships."
34. **DR. ROBERT E. WHITE:** A recently retired university Professor of Physics with over 30 years' experience in nuclear radiation physics. Dr. White was a founder of Scientists Against Nuclear Arms in May, 1983. Dr. White's affidavit in part documents his efforts over years to get documents and information released pertaining to disaster preparedness in connection with nuclear warship visits to New Zealand.
35. **PATRICIA LEE WILLIS:** Research Coordinator for the international organization, Pacific Campaign to Disarm the Seas. Patti Willis is the author of many papers, and has addressed many group on the subject of nuclear navies and their safety and environmental implications. Patti Willis documents carefully three examples from her experience of the federal government's secrecy and inadequate responses to inquiries by the public on issues of naval nuclear safety.
36. **DAVID WILLIAMS:** A Director of VIP Society, and local realtor. David William's affidavit appends the three October 30, 1991, Orders-In-Council concerning the porting of nuclear- armed and nuclear-powered warships, and the passage of U.S. nuclear submarines through the Dixon Entrance. Also appended to David William's affidavit is the "secret" memo from David Barnes of FEARO (Federal Environmental Assessment Review Office) to the federal Cabinet concerning a public review of nuclear ship visits. This David Barnes memo is crucial, since Barnes supported the provision of a public review of these nuclear ship visits, and told the Cabinet "It would be preferable to follow the Process, rather than avoid it."
37. **CHIEF MICHAEL NICOLL YAHGULANAAS:** An elected Chief Councilor of the Old Massett Village Council, also known as the Masett Indian Band, and a member of the Council of the Haida Nation. Michael Nicoll Yahgulanaas discusses the purposeful discharge of coolant waters from nuclear-powered submarines. He discusses the risk of harm to food sources and throughout the ecosystem.(From a VIP report)

( ) THAT . I wrote the following affidavit:

I, Joan Russow, PhD student, of 1230 St Patrick St. of the city of Victoria, Province of British Columbia MAKE OATH AND SAY AS FOLLOWS:

1 That I am a Doctoral Candidate in Interdisciplinary Studies at the University of Victoria, and that I have extensive experience in analyzing and categorizing research data.

2 That I have made a preliminary content analysis of the statements contained in some related statutes that may be applicable to this case and I have attempted to extract general principles from these statements.

3 That I believe that the statements in these statutes can be subjected to the same form of content analysis as statements in other disciplines.

4 That I have analyzed statements in the following Government of Canada statutes and attempted to extract and categorize general principles underlying these statements:

The Atomic Energy Control Act, R.S. C A-19, S 1

The Emergency Preparedness Act, 1988, C 11.

The Canadian Environmental Protection Act, 1988, C 22.

The Environmental Contaminants Act, 1974-75-76, C 72.

The Fisheries Act, 1977, C 35

The Department of the Environment Act, R.S., C 14 (2nd Supp.), s2

The Government Organization Act 1979, C 13

The Hazardous Products Act, R.S., C H-3, S 1

5. That in all the statutes, which I examined, dealing with either hazardous materials or the pollution caused by hazardous materials, importance is placed on the determination of the safety of the hazardous materials. And it is recognized that in order to determine safety, it is necessary to have information about the materials and their uses. This principle is enunciated in the following examples drawn from the statutes.

a) In section 11 (Disclosure) of the Hazardous Products Act, "disclosure of information is required where the Minister has reason to believe that a product or substance may be dangerous... The Minister may send a written notice to the manufacturer of the product or substance requesting the manufacturer to disclose to the Minister the formula, composition or chemical ingredients of the product or substance and such other Information in the possession of the manufacturer as the Minister deems necessary for the purpose of determining whether the product or substance is or is likely to be a danger to the health or safety of the public."(The Hazardous Products Act. R.S., CH-3, S 1)

b) Pursuant to 7 (2) Of the Environment Contaminants Act "where the Minister of National Health and Welfare believes that a substance will constitute a significant danger to human health or the environment, the Minister may send a written notice to any person engaged in any commercial, manufacturing or processing activity involving the substance or any member of a classes of substances of which the substance is a member requiring that

person to furnish the Minister with such information specified in the notice.” (The Environmental Contaminants Act. 1974-75-76, C 72)

- c) Section 33. 1 of the Fisheries Act states the following:  
“Every person who carries on or proposes to carry on any work or undertaking that results or is likely to result in
- a) the deposit of a deleterious substance in water frequented by fish or in any place under any conditions where that deleterious substance or any other deleterious substance that results from the deposit of that deleterious substance may enter any such water, or
  - b) the alteration, disruption or destruction of fish habitat shall on the request of the Minister... (a) provide the Minister with such plans, specifications, studies, procedures, schedules, analyses, samples or other information relating to the work or undertaking and with such analyses, samples, evaluations, studies or other information relating to the water, place or fish habitat that is or is likely to be affected by the work or undertaking as will enable the Minister to determine
  - c) whether there is or is likely to be a deposit of a deleterious substance by reason...d) whether the work or undertaking results or is likely to result in any alternation, disruption or destruction of fish habitat.”
- (Federal Fisheries, 1977, C. 35)

6. That the principle is repeatedly seen in these statutes that the government has a duty to provide the public with crucial and essential information about the environment

- a) In section 5 of the Department of the Environment Act it is written:  
“The Minister in exercising his powers and carrying out his duties and functions ... shall...  
(iii) provide to Canadians environmental information in the public interest.” (Department of the Environment Act, R.S., R.S., C 14, 2nd Supp., S 2)

- b) Also, in section 19 (6) of Canadian Environmental Protection Act the Minister may disclose information  
“Where
- a) the disclosure is in the interest of public health, public safety or the protection of the environment and
  - b) the public interest in the disclosure clearly outweighs in importance any material financial losses or prejudice to the competitive position of the person who provided the information or on whose behalf it was provided.” (Canadian Environmental Protection Act, 1988, C 2)

- c) In section 6 of the Government Organization Act, the mandate is given:

“6 (iii) to provide to Canadians environmental information in the public interest.” (Government Organization Act, 1979, C 13)

7. That the principles are repeatedly enunciated in these statutes that the environment is worthy of protection and that government has a duty to protect the environment and to prevent environmental harm

a) “It is hereby declared that the protection of the environment is essential to the well-being of Canada.” (Canadian Environmental Protection Act, 1988, C 22)

b) “Whereas the presence of toxic substances in the environment is a matter of national concern.” (Canadian Environmental Protection Act, 1988, C 22)

c) In the Department of the Environment Act, under the division of "Powers, duties and functions of the Minister, it is stated that “the duties of the Minister include providing for

a) the preservation and enhancement of the quality of the natural environment, including water, air and soil quality; and to

2(i) endeavour to protect the environment from the release of toxic substances.” (Canadian Environmental Protection Act, 1988, C 22)

d) The duty of the Federal Government is that it shall (a) take both preventative and remedial measures in protecting the environment, (section 2, Canadian Environmental Protection Act, 1988, C 22).

e) In section 5 Department of the Environment Act  
“The Minister in exercising his powers and carrying out his duties and functions under section 4 shall...  
5(ii) ensure that new federal projects, programs and activities are assessed early in the planning process for potential adverse effects on the quality of the natural environment and that a further review is carried out of those projects, programs, and activities that are found to have probable significant adverse effects and the results thereof taken into account.”

f) Furthermore, in Section 2 of the Environmental Contaminants Act consideration is given to effects that are persistent and cumulative:

“(iii) the extent to which the substance or any class of substances of which it is a member can become dispersed and will persist in the environment.

(iv) the ability of the substance or of any class of substances of which it is a member to become incorporated and to accumulate in biological tissues and to cause biological change.” (The Environmental Contaminants Act. 1974-76)

8. That the principle is set out in the regulations related to the Atomic Energy Board Act that extreme precautions must be taken in the transport of atomic materials:

a) “\*(2) Any person who transports or causes to be transported any radioactive material ...” (see Exhibit A for the list of stipulated regulations for atomic materials)

9. That the principle is expressed in the Emergency Preparedness Act that the government has a duty to make extensive provisions for civil emergency preparedness

a) “5 (1) c to provide education and training related to civil preparedness or emergencies.” (Emergency Preparedness Act, 1988, C 11)

b) “5 (1) e to analyze and evaluate civil preparedness for emergencies and conduct related research.” (Emergency Preparedness Act, 1988, C 11)

( ) THAT on December 24, we marched up to the Esquimalt Naval base. We walked in a long pageant-style procession. It was televised. I was walking with a sheep dog and tied my hair across my face as a beard. There was a pregnant Mary, with a basket of doves. We were met by a number of security people at the base, and we were asked: “who do we represent, and one of the Grannies declared,” [a witty remark that baffled them as doves flew up in the air.]

~1992

( ) **THAT** in 1992, I worked with the Whistler Foundation for a Sustainable Environment and the Nuclear Age Peace Foundation on the Nobel Laureate Statement to Rio, and I was responsible for distributing the Statement at the international Conference.

## EXHIBIT

### 1992 NOBEL LAUREATE DECLARATION

Nuclear Age Peace Foundation and Whistler Foundation for a Sustainable Environment.

“The primary goal of the summit will be to lay the foundation for a global partnership between developing and developed countries based on mutual need and common interest, to ensure the future of the planet. This partnership will undoubtedly require the mutual solution of the population and over-consumption issues. Equity and environment problems are linked and must be solved together. Further the only major source of the discretionary funds necessary for addressing these issues rests in the radical reduction of the military budget of the Nations of the World” Dr Fred Knelman, Vice President of the Whistler Foundation For a Sustainable Environment; and Dr David Krieger, President of the Nuclear Age Peace Foundation.

### NOBEL LAUREATE STATEMENT TO UNCED 92

We, the undersigned Nobel Laureates, urge all nations and peoples to unite in the great cause of creating a secure and sustainable Earth.

This important conference, Earth Summit, links two key issues of sustainability – environment and development – and offers a unique opportunity to find global solutions to problems threatening our common future. Recognizing that we all inhabit one earth and share a common responsibility to posterity, we urge you to act decisively.

- to protect and preserve the integrity of the biosphere, that sustains all life by establishing adequate global regulations, penalties and enforcement mechanisms to prevent human induce global warming, depletion of the ozone layer, destruction of forests and fisheries, pollution of air and water, irreversible loss of species, and release of hazardous substances into the environment.
- to establish a time –table for phasing our fossil fuel and nuclear energy and for the rapid development of solar and other forms of non-polluting energy, and for more efficient energy use;
- \* to end hunger and poverty in the world by the transfer of adequate resources and environmentally sound technology required for this task;
- \* to demand an immediate end to all nuclear weapons tests.
- \* To prevent further proliferation of nuclear weapons and other weapons of mass destruction by establishing effective international controls.
- \* To develop international regulations regarding nuclear waste disposal and nuclear power plant operations
- \*To initiate a global program of population stabilization
- \*To promote a global educational campaign to encourage resource conservation, recycling and environmental protection; and
- \*To bring protection of the environment under the rule of international law, establishing appropriate regulation, criminal penalties and methods of enforcement, witching the structure of the United Nations and other international organizations

Signed: Gerd Binnig, The XI Dalai Lama, Leo Esaki, Val L. Fitch, Herbert A. Hauptman, Dudley Herschbach, Gerhard Herzberg, David H. Hubel, Jerome Karle, Gregory S. Kavka, Klaus von Klitzing, Leon M. Lederman, Yuan T. Lee, Wassily Leontief, Bernard Lown, Mairead Corrigan Maguire, Barbara McClintock, J.E. Meade, Sinon van der Meer, Bruce Merrifield, Marshall W. Nirenberg, Linus Pauling, John Polanyi, Carlo Rubbia, Abdus Salam, Claude Simon, Herbert A. Simon, George D. Snell, Roger W. Sperry, Henry Taube, Jan Tinbergen, Archbishop Desmond Tutu, George Wald, Elie Wiesel, Robert W. Wilson.

( ) THAT IN March 1992 , I attended Global in Vancouver

( ) THAT in March 1992, I participated in the Prep Com for UNCED in New York

COMMENT

By Joan Russow

On behave of the Whistler Foundation on Sustainable Environment

March 1992, I attended a meeting of accredited NGOs. Prior to this meeting I had attended a number of sessions on Climate Change where the state governments were seriously discussing the issue. At the meeting of NGOs, the topic was not issues that should be addressed but who should be allowed to have accreditation. There appeared to be concern that too many NGOs during the UNCED process had been given accreditation and that UNCED should be deemed to be a special case and that the accreditation should not be extended beyond UNCED.

I commented that perhaps I had come to the wrong meeting the NGOS appeared to be more concerned with sustaining themselves than with dealing with vital issues. I walked out. Someone came out later on and told me that quite a discussion ensued after I left about the issue that I had raised.

Prep com UNCED March 1992, I attended sessions on Indigenous issues. I was at a session where a Brazilian Indigenous man was speaking in Portuguese. It was a session in Spanish which I understand. He was such a powerful speaker that I felt I understood Portuguese. At the end of the meeting we all went over to the General Assembly where a meeting was in progress on indigenous issues. I decided to sit in the Canadian government section which was empty. The speaker, who had the floor, declared that he was furious with the Canadian delegate for refusing to add an "s" to indigenous people. I felt very uncomfortable given that I was the only one sitting in the Canadian delegation section. I was sure that if this discussion were to continue that soon they would refer to the Canadian delegate as "he" and it would be obvious that they were not speaking about me. Another speaker got up and again criticized the Canadian delegate and at that time rather than mentioning "he" referred to the delegate as "she" I did not know what to do what a dilemma I could get up and change sections but I would appear to be guilty or I could stay and be deemed to be guilty. It was like trial by ordeal in water. If I sink, I would be innocent if I floated, I would be guilty. The last speaker explained the significance of the [s] if there were no 's' then there would be only one indigenous delegation at the UN; with the "s", however, there would be several delegations. Suddenly a woman stood up several rows in front, obviously not having the courage to sit in the Canadian section, and defended the Canadian position.

I decided to raise my hand and report that given that at this moment Mulroney is only at 20% of the polls, and that I was sure that the other 80 % would support adding the s and given that I was the only representative sitting in the Canadian section that I would like to propose that the s be placed on all documents with references to indigenous peoples. Before I could make my statement, the meeting closed down. I went up to the moderator after and told him what I was going to say and that I would lobby in Canada to have the s back.

I slipped into the government discussion of the draft Earth Charter. When a Norwegian with elegant swirled turban walked in; at that one point the Chair asked if there were any NGOs were in the room. I felt obliged to leave. I should have stated what my concerns were with the Earth Charter but instead I rose and indicated that I had several concerns and the chair responded that I could meet with him after. I left and went outside with my diagram and spoke to delegates about the exclusion of those delegates who did not speak English. I am able to speak French and Spanish and I raised the issue of the failure of the UN to accommodate in the working groups any official language other than English. I went back and spoke to the Chair about

proposed changes to the Earth Charter. One of which was the Sovereign Right to exploit resources. After the meeting I went to talk with the chair about several sections in the Earth Charter that I thought should be modified or changed. In one of the evening sessions when they were working on the Earth Charter, the US proposed that principle 14 be removed because it was redundant. This principle was that states should prevent the transfer to other states of substances that are harmful to human health or the environment. The US claimed that this was the same as the trans-boundary principle. I believe it was Austria who stated that you are not fooling anyone. that seemed to stop the US and that principle is still in the document.

( ) THAT I co-authored. With Fred Knelman, F. and J. Russow. (1992) The "not-too-hidden agenda" of the International Atomic Energy Agency (IAEA) at UNCED: nukespeak, and seductive devices, doctrines, dogmas, strategies and fallacies". Paper widely circulated at International Conference and to organizations.

## **EXHIBIT**

### **1992 THE "NOT-TOO-HIDDEN AGENDA" OF THE INTERNATIONAL ATOMIC ENERGY AGENCY (IAEA) AT UNCED: NUKESPEAK, AND SEDUCTIVE DEVICES, DOCTRINES, DOGMAS, STRATEGIES AND FALLACIES**

By Dr F.K. Knelman and Dr. Joan E. Russow

Dr F.K. Knelman is the Vice President of the Whistler Foundation for a Sustainable Environment, and Dr. Joan E. Russow, was the delegate for the Whistler Foundation at the New York Preparatory Committee for UNCED and at the Earth Summit at Rio. The Whistler Foundation and the Nuclear Age Peace Foundation had circulated a Declaration that was signed by 37 Nobel Laureates; this declaration called for the phasing out of Nuclear energy. They requested permission to read this declaration at one of the plenary sessions at Rio Centro; permission was denied.

The International Atomic Energy Agency (IAEA) was initially set up in the 1960's to regulate Nuclear energy; they have, however, become one of the strongest proponents of nuclear energy. A fundamental regulatory principle of the "separation of function" is that "the agency entrusted for regulating a technology cannot be the same agency that promotes the use of that technology"(Knelman, 1975). IAEA, through its UNCED document entitled "Nuclear Techniques and Sustainable Development." acted as a major proponent, not only of the current use, but of the increased use of nuclear energy.

Agenda 21-- the 700-page far-reaching action-plan document from UNCED, was adopted unanimously by the global community represented at the Earth Summit in Rio. In Agenda 21 the following concern about radiation was expressed:

The deterioration of environmental quality, notably air, water and soil pollution owing to toxic chemicals, hazardous wastes, radiation and other sources, is a matter of growing concern. (Chapter 16. subsection 12),

The extent of the consequences of the nuclear industry were also identified in Agenda 21:

Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste (as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. (Chapter 22, subsection 1)

Yet at one of the plenary sessions, Mr. Hans Blix, Director-General of the IAEA, was given permission to present a document advocating nuclear energy as being a safe alternative energy for the future. The International Non-Governmental Organizations (NGOs) however, recognized that the fundamental regulatory principle had been violated and gave IAEA the dubious honour of being presented with the International NGO Community's "Most Preposterous Proposal Award" "for presenting nuclear power as the environmental solution in energy and successfully keeping its problems out of the documents".

We would like to highlight some of the SEDUCTIVE DEVICES, STRATEGIES, DOCTRINES, DOGMAS and FALLACIES that have made the IAEA worthy of this honour. The examples will be drawn from IAEA document which was prepared for UNCED. Also references will be made to other UNCED Documents such as Agenda 21 and the Rio Declaration-- the Earth Charter-- 1992, and the Canada's National Report for UNCED, 1992

The seductive devices, strategies and fallacies used by the IAEA all draw upon the fundamental language of 'nukes peak'. Knelman (1986, 1992) has expanded on the euphemistic nature of Nuke speak: (term first used in Hilgartner S, R. Bell, and R. O'Connor 1982)

The rule is sanitize by euphemism: political euphemism is of course older than nuclear power. How many of us recognize the "elimination of unreliable elements"? There are forbidden words in the language of civil nuclear power. For example, the words "accident", "pollution" or "disease" are never used. Accidents are either "transients", "events", "significant events", "anomalies", "occurrences" or "abnormal occurrences". In the extreme, they become "normal abnormalities", i.e. truth becomes lies. Explosions are "events of rapid disengagement" or "prompt criticality". Waste dumps are "residue areas". Thermal pollution becomes "thermal effects" and pollution becomes "impacts". Disease becomes "health effects". This is a euphemism for cancer and genetic malformations. And missing plutonium, which is the link to clandestine acquisition of nuclear explosives is "material unaccounted for" or simply MUF! (Knelman, 1986.)

Other names relating to nuclear accidents are criticality, nuclear excursions, abnormal evolution, normal aberration, plant transients, unnecessary ignition sources. "Nukespeak" is perpetuated through "nuclear acceptance campaigns" by the PR departments of the nuclear establishment, designed to find "palatable synonyms" for "scare words" through the use of "truth squads" in order to remove "undue public concern", create "pro-energy climate" where "technically qualified persons" would agree that nuclear power poses "no significant threat" and could be entrusted" for the timely detection of potential abnormalities, or there is "no evidence" of such threat ( as though lack of evidence is proof of assertion) and the promises that turned into lies i.e. that nuclear power would be "too cheap to meter" providing society with "boundless energy" and save us from "freezing in the dark"., this is the language of Orwell's 1984, where peace is war and truth is a lie. ( Knelman, 1992).

### Seductive devices, doctrines, dogmas, strategies and fallacies

- The "blatant misrepresentation or expedient omission" device

This device involves the convenient exclusion of any part that could be detrimental to one's position.

The IAEA through expedient omission (possibly for advantageous "clarification") has left out a significant section in Agenda 21 which does not include nuclear energy in the list of "safe" technologies for the future. To "clarify" Agenda 21, the IAEA in its UNCED document stated the following:

The UNCED Agenda 21 notes the need for a transition to environmentally sound energy systems, which will entail major changes in the patterns of energy production and consumption (IAEA Document, p.5, 1992)

In the Atmosphere chapter of Agenda 21, the following [safe] and sound technologies are advocated:

cooperate to increase the availability of capacity, capabilities and relevant technologies ...for utilizing and producing environmentally [safe and} sound renewable energy resources, such as solar, wind, geothermal, hydropower and biomass, ... Each resource should be utilized in a manner that ... minimizes environmental stress and health impacts, .... (Section 9. Subsection 9 g Agenda 21, 1992)

Thus, we see that in the Energy section of Agenda 21, Nuclear energy is not mentioned as being one of the [safe] or sound technology.

- The "co-opted terms" strategy

This strategy involves the stipulating of a new definition for a term that would jeopardize one's own argument.

In the Rio Declaration the following precautionary principle was advocated:

Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).

In the following statement, the IAEA redefines the important precautionary principle that was agreed to in the Rio Declaration, 1992.

The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary (IAEA Document, p. 2, authors emphasis)

The Rio principle, however, if enacted and truly adhered to, would bring about a moratorium on new nuclear power plants while phasing out currently existing ones.

- The "comparison of convenience" device

This device involves the narrowing down of alternatives so that whatever aspect is compared will appear favourable to the proposed alternative.

In the following statement from the IAEA document, the IAEA narrows the alternatives used for comparison to those which would appear to be favourable within the terms of reference of their comparison. Thus, for example, they compare the relatively low volume of nuclear wastes to the much larger volume of wastes from fossil fuels. However, it is the volume of wastes multiplied by their toxicity that is significant. Merely comparing volumes is a "comparison of convenience". The same false comparison is used to compare fuel requirements for the same energy output.

A nuclear plant would require 27 tonnes of slightly enriched uranium each year, which corresponds to a few truckloads. The corresponding quantity of natural uranium is 160 tonnes.

a coal fired plant would need 2.6 million tonnes of coal each year... which corresponds to the load carried by 5 trains, each transporting 1400 tones every day

an oil-fired plant would require 2 million tonnes of fuel oil per year, which is about 10 supertanker loads. (IAEA document, 1992, p.12)

The nuclear establishment never fails to compare coal and nuclear as competing energy sources, always claiming the inherent superiority of nuclear. Usually this is accomplished by failing to include the entire fuel cycle over its full life of impacts, social and environmental. They conveniently exclude "safety" factors," "production of wastes," "disposability of wastes," "degree of potential for bioaccumulation," lifetimes of wastes, toxicity and proliferation problems associated with nuclear.

Yet no bombs are built of coal, no terrorist is interested in hijacking coal or in the clandestine acquisition of coal weapons, coal plants do not have to be decommissioned and mothballed after some 30 to 50 years of operation, their hazardous wastes do not have to be guarded for 100,000 years, coal dust is easier to contain than radon and coal plants do not require liability subsidies by acts of parliament" ( Knelman, 1992)

- The "lull and lure of the technological fix" syndrome (the "misleading assurance" device or the fallacy of "technological omnipotence")

This syndrome, device or fallacy involves the revealing of the seriousness of the problem and the offering of a "solution" which is usually worse than the problem

The proponents of a potentially dangerous act indicate that they recognize the danger and focus on one area for which they can offer a technological fix

In the following statement from the Radioactive Wastes section of Agenda 21, into which it appears that the IAEA had input, the following situation is recognized:

Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste (as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. The high-level waste contains about 99 percent of the radionuclides and thus represents the largest radiological risk. (Agenda 21, Radio Active wastes, 21.1.).

In the IAEA document the authors affirm the certainty of the technological fix.

There is nevertheless a consensus among experts that safe geological disposal of high-level wastes, including spent nuclear fuel, is technically feasible. (IAEA Document, p.17)

The view of experts in the field is that safe technological solutions exist for managing the waste. (IAEA Document, 1992, p. 15)

Knelman (1992) points out that

The assumption behind the notion of permanent disposal of High level wastes deep in a stable geological formation is false because this assumption relies on the mistaken belief that anything we do technologically can be permanent This assumption of permanence is particularly false when we are dealing with the lithosphere over some 100,000 years and when we must first disturb the geological structure by digging a very deep hole. AECL (Atomic Energy of Canada Limited) has dug a deep hole near Lac du Bonnet in Manitoba which is totally inappropriate for such so-called "permanent" disposal. For one thing you must, in all events, avoid water. Yet, The AECL hole must be soaked

Walt Patterson, a nuclear critic described this AECL research as follows: A drunk has lost his keys and is discovered by a police officer crawling around a street light. When questioned, the drunk admitted that he had lost his keys in front of a dark building, a block away. When asked why the drunk was then searching around the street light the drunk said "you see, officer, the light is better here" and as Dr Martin Resnikoff, an expert on geological waste disposal has put it, " the earth does not stand still. "In other words, experts in the relevant fields do not agree. (Knelman, 1992, in progress)

- The "rhetoric of notwithstanding clause" doctrine.

This doctrine allows for the indulging in strong statements about deep concern and the need for significant change and then including a notwithstanding clause that negates the strong statement.

In the Rio declaration (1992) there is a strong statement about third world dumping:

States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health. (Principle 14 Rio Declaration, 1992)

There are, however, disturbing "notwithstanding clauses" that appear such as in the following statements:

Develop regulatory and non-regulatory measures and procedures aimed at preventing the export of chemicals that are banned, severely restricted, withdrawn or not approved for health or environmental reasons, except when such export has received prior written consent from the importing country or is otherwise in accordance with the PIC procedure; (Section 19. subsection 53 f, Agenda 21, 1992)

In the following statement in the IAEA document, the IAEA energetically adopts the spirit of the "rhetoric of notwithstanding clauses"

The IAEA in 1990 promulgated a Code of Practice on the International Transboundary Movement of Radioactive Waste as a basis for harmonization of national legislation and policies. The code lays down the conditions and principles for international waste transfers, such as that movement must be made in a manner consistent with the international safety standards, that there must be prior notification and consent of the sending, receiving and transit States, and that each State involved should have a regulatory authority...( IAEA Document, 1992, p. 20

- The "flamboyant absurdity" doctrine or dogma

This doctrine or dogma carries the concerns of one's opponents to the point where the regulations governing the opponent's concerns should become the standard by which other potentially lesser concerns will be addressed.

The IAEA appears to advocate that, what is considered to be the most dangerous industry, just because it is dangerous, has developed stringent standards, and that they who contribute to possibly the greatest uncontrollable hazard are the ones who should assist the community in dealing with other hazards.

The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary and are so well founded in science and so widely accepted that they are now also being regarded as a source of guidance in controlling pollutants and impacts arising from other human activities. Their wider application would undoubtedly contribute towards sustainable development. (p.2)

- The "justification through dire consequences of alternatives" device

This device involves the revealing of the dire consequences of the current practices and offering one own practice as the salvation for the problem

In the following statement the IAEA cites the dire consequences of the other alternatives to justify their proposed alternative:

The problem of acid rain, which is linked to emissions from the burning of fossil fuels, has been recognized for decades.... the primary concern about the continued and increasing use of fossil fuels is the problem of CO<sub>2</sub> emission and the potential impact on world climate..... World conference on the Changing Atmosphere... need to reduce CO<sub>2</sub> emission (IAEA document, p. 5)

climate change in connection with fossil fuels (p. 9)

- The "benevolent outcome exploitation" strategy

This strategy involves the selection of the outcome which the opposition to the proposed alternative would advocate and the subsequent attempt to demonstrate that the proposed alternative, which the opposition would condemn, would be the best way of achieving that outcome.

In the following statements from the IAEA document, the IAEA focuses on the desired outcomes of reducing acid rain and limiting greenhouse gas to justify the selection of their proposed alternative:

Several governments have already made commitments to reduce carbon emission, while recognizing that this will be hard to achieve except through drastic policy decisions in the energy sector. (IAEA Document, 1992, p.6)

Nuclear power plants in normal operations cause very little environmental detriment and are beneficial when they replace plants which would emit CO<sub>2</sub>, SO<sub>2</sub>, and NO<sub>2</sub> (p. 12). In this respects they would help to reduce acid rain and limit greenhouse gas emissions (IAEA Document 1992, p. 12).

To accomplish the above, IAEA and other nuclear proponents are recommending the construction of some 4000 to 5000 new commercial nuclear power plants. The combination of the multi-trillion cost and the time required for construction renders this proposal no less than bewildering. By the 6 to 10-year period required for construction, other sources of climate-altering gases would wipe out all gains. Secondly at 1/7th to 1/10th the above cost, a much greater reduction in CO<sub>2</sub> and other climate-altering gases can be achieved through simple available conservation and efficiency measures.

- The "flaunting and condoning of the vicious circle principle" strategy

This strategy is best explained by the economic principle that "bad money drives out good,"; that is the opportunity costs of nuclear power are unacceptable and prohibitive. Thus the money spent to subsidize nuclear power is at the expense of the funds required to solve the energy problem with safe alternatives and consequently, because the research into alternatives will not be effectively carried out, the safe alternatives will not be able to adequately replace the non-renewable forms of energy.

In the 1992 report to UNCED, following was stated:

Nuclear energy has safety risks associated with the entire uranium cycle, from mining through processing to the ultimate disposal of high-level radioactive wastes. In addition, there are safety risks associated with the reactors used to generate electricity from uranium. And the use of fossil fuel to drive conventional thermal generation produces carbon dioxide and waste heat. (Canada's National report UNCED pp. 46- 47).

From a domestic consumption point of view, the least environmentally damaging energy option is energy efficiency. (Canada's National report UNCED p. 47)

Despite the above statement, the document concludes:

New, cleaner technologies such as solar energy may help, but the hard fact is that to a large extent we will have to rely on either thermal, hydro, or nuclear energy in the future. In addition, energy projects for both export and domestic supply provide jobs and economic wealth to the country, and are especially important in some regions of Canada" (p. 47. Canada's National report UNCED June, 1992, authors' emphasis),

The Canadian government has invoked the "vicious circle principle" by cutting subsidies to conservation efficiency and renewals. Canada is thus playing an important role in facilitating this not too hidden agenda by using many strategies, devices, doctrines, etc.

## CONCLUSION:

The " nukes peak" and the seductive devices, strategies, syndromes used by the Nuclear Industry involve the language of delusion and distortion. Hopefully, through the continued revealing and categorizing of these words of delusion we could, in some small way, counteract the impact of the not too-

hidden-agenda of the IAEA, and the rest of the nuclear establishment and their government supporters.

NAFTA, a "realization of dire predictions" or an opportunity for significant change: environmental implications."

"La nueva ecologia en Norte America"

"NAFTA, a "realization of dire predictions" or an opportunity for significant change: environmental implications."

Dobell, R. and J. Russow

MARCH 30, 1992

Paper presented by Rod Dobell

at the NAMI meeting, April, 1992 INTRODUCTION

Un dia, espero estar capable de comunicar en Espanol. Hasta esto momento, yo quiero decir solamente algunas palabras en Espanol para expressar mi gusto en estar aqui in Mexico y en asistir a questa conferencia.

When we look at the way human populations now act and interact as part of ecological structures, it is probably not unreasonable to treat North

America as an ecosystem in itself, linked together both through the dynamics of natural system and through economic relationships.

The thread of my reasoning here in this brief paper is very simple:

1. There have been a lot of concerns expressed about NAFTA as a threat to social goals, including environmental goals, in all three countries.
2. All three countries of North America have expressed their environmental objectives very clearly (although implementation often does not follow), and want to see them respected in trade arrangements.
3. The GATT tradition is different. From experience with GATT and other trade deals, it seems clear that environmental objectives have to be explicitly addressed within NAFTA.
4. NAMI might help in educational efforts and in animating a broad consensus on strong environmental provisions within NAFTA"

But the problem is being approached from the wrong direction at the moment. The difficulty is that NAFTA negotiations are in the hands of trade policy people. These policy people work from a very strong tradition of economic analysis, and they are out to slay a particular dragon—the dragon of *protectionism*.

This view of the problem sees the solution as writing "trade rules governing environmental measures".

But I want to argue that this whole approach is backwards. The starting point is the need to assure the integrity of the ecological systems of the planet. At our scales of population and economic activity, it is no joke to say that the life-support systems on which we all depend are truly at risk.

We must therefore shape our trade policy, like all our other economic policy, within some over-riding agreed framework of environmental ground rules

Therefore, I want to talk about trade and environment questions involving the three countries of North America. In particular, I should like to discuss briefly with you the way in which the conflicts between trade values (the goal of unimpeded flows of goods and all) and environmental values (pursuit of a sustainable society through conservation of resources and preservation of biodiversity) might be resolved within the emerging North American community.

I start from the premise that economic integration is occurring, and will continue. The domain of the economy is now the globe (even if the domain of the polity still reflects much smaller communities). It is not desirable or sensible to fight this process — the big cliché of the Canada-US FTA debate

(that "the status quo is not an option") is surely equally correct in relation to the on-going NAFTA negotiations. We can, however, and — in my view we must, however, resist the tendency toward unlimited growth and the perceived mandate for development even at the expense of social or environmental goals. Economic integration will occur but needs to be channeled and guided by some agreed synthesis of common high environmental goals.

In all our three countries citizens and organizations are concerned about the apparently unquestioned imperative to grow, the relentless destruction of the environment, rapidly increasing loss of ecological heritage, and increasing disenfranchisement and poverty. Citizens are also concerned about arriving at solutions to these problems.

## 1. CONCERN ABOUT NAFTA

These concerned citizens look with trepidation on the proposed trilateral trade agreement. For different reasons they see it as a threat:

### i. The growth imperative.

There is reluctance in political and industrial circles to address the need to limit growth and over-consumption, and a concomitant reluctance to acknowledge the implications, both social and economic of violating those limits.

In the process of wrapping the semantic capsule 'sustainable development' around this potentially unpalatable two sided world-view was born the genteel ploy of emphasizing the growth imperative for consumption in the South and the industrial communities comfortable with "business (much) as usual", while focusing on sustainability for purposes of dealing with the increasingly strident and influential concerns of environmental movements and scientific bodies documenting the possible dangers of global change. Thus there remains latent much of the old Stockholm debate between environmentalists and industrialist in the North and between developed nations of the North and developing nations of the South.(Dobell, 1992, p. 4)

Since our economies are growing and the ecosystems within which they are embedded are not, the consumption of resources everywhere has begun to exceed sustainable rates of biological production. Seen in this light, much of today's wealth is illusion derived from the irreversible conversion of productive natural capital into perishable human-made capital. (Rees, 1991, Draft. p. 9)

The result of unchecked growth has been the following:

Encroaching deserts (6 million ha/year; deforestation (11 million ha/yr of tropical forests alone); acid precipitation and forest dieback (31 million ha damaged in Europe alone); soil oxidation and erosion ( 26 billion tonnes/yr in excess of formation); toxic contamination of food supplies; draw-down and pollution of water tables; species extinction (1000s/yr); fisheries exhaustion; ozone depletion (5% loss over North America [and probably globally] in the decade to 1990); greenhouse gas build-up (25% increase in atmospheric CO<sub>2</sub> alone); potential climatic change ( 1.5-4.5C<sup>0</sup> mean global warming expected by 2040); and rising sea-levels (1.2-2.2 m by 2100) and like trends are the result of either excess consumption or the thermodynamic dissipation of toxic by-products of economic activity into the ecosphere ( Data from: Brown et al [Annual]; Brown and Flavin 1988; Canada 1988; WCRP 1990; Schneider 1990; US Environmental Protection Agency [reported in Stevens 1991]). ( reported in Rees, 1991, Draft. p. 11)

Continued development and growth has even been perceived as an inevitable fact of life by the president of the World Bank: in a recent speech, Barber Conable suggested that " a basic truth is that development cannot be halted, only directed". (Conable, 1989, p. 15)

ii. The trade policy imperative.

There is a discrepancy between the establishment of environmental policy through international commitments and the denial of the policy through free trade agreements:

In June 1988 both the US and Canada participated actively in a world conference on The Changing Atmosphere: Implications for Global Security. The conference concluded that global atmospheric problems were the product of 'an unintended, uncontrolled, globally pervasive experiment whose ultimate consequences could be second only to a global nuclear war.' and recommended national efforts to reduce carbon emissions by 20 % by the year 2005. .... yet later that year the Canada-US Free trade Agreement was ratified, entrenching energy and resource policies that are fundamentally at odds with the policy directions endorsed by representatives of the countries at the global warming conference. Under the terms of the free trade agreement; both countries forego, for as long as the agreement stands, the use of regulatory devices that could prevent the development of fossil fuel resources for export. (Shrybman, S. 1990, p. 22)

There is also the compromising of the environment as a result of trade agreements:

It [NAFTA] may limit Canada's or British Columbia's authority to establish relatively tough environmental standards; and it may limit the public's access to decision-making affecting the environment during the negotiation of an agreement and the operation of such an agreement. Therefore, the association urged the government of British Columbia to:

- undertake an environmental assessment ( with full opportunity for public access to information and involvement) of the potential impact on British Columbia's environment and environmental decision-making process
  - insist that the federal government do the same; and
  - oppose any trade agreement with Mexico that:
    - i) would impair the province's ability to set relatively high environmental standards;
    - ii) does not specify that failure to establish and enforce reasonable environmental standards is considered to be a trade subsidy; or
    - iii) does not include mechanisms to facilitate public access to information regarding and public participation in, decision-making under the agreement
- ( Environmental Law Association , Ministry of Development, Trade and Tourism,1991 p. 23)

iii. The difficulty of translating negotiated agreements into enforceable action. There is a watering down of environmental resolve when action is required. For example a policy "to prevent pollution" frequently becomes translated into action "to reduce or mitigate pollution to the extent feasible and practicable" or "as appropriate" or words to that effect.

Compare, for example, conference statements like

12. The Ministers agreed that, in order to achieve ESID, industry initiatives should include the following objectives:
- a) Adoption of pollution prevention, the approach that prevents pollution at the source in products and manufacturing processes rather than removing it after it has been created ( UNIDO, 1992, p. 7)

With operating guidelines like;

"...the thrust of the world Bank's energy work is increasingly to promote development in the energy sectors of developing countries while taking prudent steps to mitigate damage to the environment" (the World Bank, 1989)

## 2. ENVIRONMENTAL CONCERNS THROUGH INTERNATIONAL DISCUSSIONS

Thus we see that there are a number of discordant themes in the trade/environment area. We do, however, have general agreement on environmental goals.

Indeed, for at least twenty years we have engaged in fairly strong environmental rhetoric.

In June 1972 at the UN (Stockholm) Conference on the Human Environment the following statement was made and principles enunciated:

To achieve this environmental goal will demand the acceptance of responsibility by citizens and communities and by enterprises and institutions at every level, all sharing equitably in common efforts. Individuals in all walks of life as well as organizations in many fields, by their values and the sum of their actions, will shape the world environment of the future. Local and national governments will bear the greater burden for large-scale environmental policy and action within their jurisdictions.

This conference stated the common conviction that:

### Principle 1

Man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well being and he bears a solemn responsibility to protect and improve the environment for present and future generations...

### Principle 2:

The natural resources of the earth, including the air, water, land, flora and fauna and especially representative samples of natural ecosystems, must be safeguarded for the benefit of present and future generations through careful planning or management, as appropriate.

### Principle 13:

In order to achieve a more rational management of resources and thus to improve the environment, States should adopt an integrated and co-ordinated approach to their development planning so as to ensure that development is compatible with the need to protect and improve the human environment for the benefit of their population. (Stockholm Conference on the Human Environment, June 1972)

Was this only rhetoric in 1972: empty words whose legacy of inaction we now have to face?

If we are to achieve significant change we must translate our rhetoric into realistic commitments to action.

Now in June of 1992 we are entering into a new world agreement, the "Rio Declaration on Environment and Development" at UNCED, and we have also been grappling with the GATT . [EXPAND] Do these recent international documents address environmental concerns or are these documents still just rhetoric?

## **UNCED**

Indications to date suggest that the discussions at UNCED will not resolve the basic tensions between environmental goals and economic principles [ecological rights and economic privileges]. The Draft text for the RIO Declaration [on the Environment and Development] reveals still far too strong an overhang of orientation to a model of the nation-state and national sovereignty and a reluctance to curb growth or to come up with international environmental standards, with an international court of environmental law, with the enshrinement of the right to a safe environment and to an environmental heritage, or with establishing any form of international environmental governance.

In principle 2. "States have, in accordance with the Charter of the United Nations and the principles of international law, the sovereign right to exploit their own resources pursuant to their own environmental and developmental policies, and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other States or of areas beyond the limits of national jurisdiction. ( 2 April 1992, Rio Declaration on Environment and Development]

In principle 3.

The right to development must be fulfilled so as to equitably meet developmental and environmental needs of present and future generations ( 2 April 1992, Rio Declaration on Environment and Development]

The Prep Com delegates also failed to define explicitly what is meant by development: it can be argued that there is a fundamental distinction between exploitative and humanitarian development. Even the chair of the drafting committee on "Rio Declaration on Environment and Development" continued to perpetuate the simplistic myth that the north is concerned about [only] the environment and the south is concerned about [only] development.

(March 26, 1992, personal communication). Such claims overlook, of course, concerns embodied in declarations such as those in the "Constitutional Law for the Ecological Equilibrium and Protection of the Environment". (Government of Mexico, 1988)

Not only have the delegates been reluctant to argue for an agreement which limits growth and gives the environment primacy within the sustainable development context, they have also failed to recognize more fundamental non-anthropocentric rights .

Principle 1 Human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature.  
( 2 April 1992, Rio Declaration on Environment and Development]

## **GATT**

Other agreement such as GATT have NOT succeeded in resolving the tension between environmental goals and economic principles [ecological rights and economic privileges] by giving primacy to unimpeded flows of goods and all and ignoring environmental values (pursuit of a sustainable society through conservation of resources and preservation of biodiversity).

GATT is built on the premise of nation states and meaningful national borders. Indeed the whole apparatus of international law has to presume that the relevant actors are national governments.

GATT, as presently interpreted, fails to recognize the "power of governments to implement environmental regulation ..." and brings about "increased economic pressures to reduce environmental standards."  
(Comments by Rolfe, C. , "Environmental considerations regarding a possible Mexico-Canada Free trade Agreement," for the West Coast Environmental Law Association, February, 1991).

Each one of the three states involved in the current NAFTA negotiations has attempted to object to other states using high environmental standards to influence trade, and in each case GATT has supported the state seeking to object to high standards:

"The Canadian pulp and paper industry has urged Canada to challenge U.S. laws requiring the use of recycled fibre in newsprint." (Shrybman, 1991, p. 13). The Canadian government has argued that a US. Environmental Protection Agency rule banning the use of all forms of asbestos violates the US. Canada FTA and GATT( Eric Christensen, "Pesticide Regulations and International Trade", Environment, Vol. 32. No. 9, November, 1990, p 45)

The U.S. recently proposed in GATT negotiations that nations be prevented from adopting domestic pesticide standards more stringent than international standards. (Eric Christensen, "Pesticide Regulation and International Trade", Mark Ritchie, "GATT, Agriculture and the Environment: The US Double Zero Plan, " The Ecologist, Vol. 20, No. 6, November, 1990, p. 214.)

The U.S.- based Non-Ferrous Metals Producers Committee is using the U.S.- Canada FTA to support its challenge to Canadian federal and provincial pollution control programs intended to reduce emissions from the Canadian smelting industry. ( Shrybman "Selling the Environment Short: an environmental assessment of the first two years of free trade between Canada and the United States", Canadian Environmental Law Association, January, 1991, p. 13)

(cited in Rolfe, Chris, Environmental considerations regarding a possible Mexico-Canada Free trade Agreement for the West Coast Environmental Law Association, February, 1991).

And Mexico ... When in 1990 the U.S. placed an embargo upon tuna products from Mexico, "Mexico complained that the tuna embargo was inconsistent with obligations owed to Mexico under GATT. The September 1991 report of a three-member panel of experts established pursuant to the third-party dispute settlement procedures of GATT determined that the American embargo on Mexican tuna, even though designed to conserve dolphins was inconsistent with the GATT ( McDorman, T. 1991, p. 2)

The GATT Panel stated that under the GATT " a contracting party may not restrict imports of a product merely because it originates in a country with environmental policies different from its own". ( US. Mexico GATT Panel, 3 September 1991, at paras 2.1-2.2). It is this statement that has been seen as the biggest problem with the "GATT Panel report from an environmentalist point of view. ( McDorman, T. 1992, p. 19). However, even the normally environmentally sensitive Nordic countries have indicated that a country is not free 'to require that imported products [be] produced as cleanly abroad as at home." ( EFTA members press convening of working party, 82 Focus- GATT Newsletter 2-3 (July 1991) Any other conclusion reached by the GATT Panel would allow certain countries to dictate to others what standards must exist and this would clearly be an invasion of a country's sovereignty. Moreover, as the Panel concluded, any other conclusion would permit trade only between countries with identical regulations and this would amount to a dismantling of

the GATT. (McDorman, T., 1992, p. 19) CHECK CITATIONS PUT IN FOOTNOTES

The unwillingness to "impose standards" was underlined in the Venezuelan intervention when the delegate stated,

Potentially, any nation could thereby justify unilaterally imposing its own social, economic or employment standards as a criterion for accepting imports. Any influential contracting party could effectively regulate the internal environment of others simply by erecting trade barriers based on unilateral environment policies. ( The Venezuelan intervention in the U.S.- Mexico GATT Panel, note 3, at para. 4.27).

Rather than considering high standards an "imposition", perhaps we should contemplate high standards as "the expression of collective will". Given the recognized urgency of the global situation, the relevant goal should perhaps be the attaining of the highest tenable common standards so that at least within the North American context through a strongly principled NAFTA... our energy could be directed toward moving upward to these standards rather than in using the GATT to condone and even foster lower standards.

Thus the goal of trade policy and GATT is almost the antithesis of the goal of international agreement on environmental standards.

GATT prohibits discrimination among like products according to their mode of manufacture. An environmental agreement, on the other hand, would like to discriminate strongly in favour of environment—friendly processes and production methods.

In the long run, the only way this can be effectively accomplished is by thorough-going resource pricing and internationalization of all environmental costs. But even then we need strong social ground rules, and government action to create a framework for the system expressing agreed environmental objectives and establishing a regulatory strategy to achieve them.

We must, in other word, assure that trade policy is the servant of our broader [environment] and development goals. Anything less than full environmental pricing must be seen as a trade-distorting subsidy and unacceptable in a liberal trading regime.

The point is to establish clearly some prior international understanding on the primacy of the environmental concern. Protecting the ecological systems on which we all depend must be the foundation for other relationships.

We must cast the requirement of sustainability [sustaining the environment] as the starting point for any negotiations on trade policy or economic activity. "The environment" —particularly the renewable resource base, ecological systems and the gene pool — represents the trust fund and the core asset which has to be preserved throughout all our other activities.

The GATT argument, and the conventional economic argument, is that we have to become rich enough to be able to afford environmental protection, clean up, and a high quality of life.

The sustainable development argument, properly interpreted, seems to me almost exactly contrary. Of course trade liberalization is important and will help to generate higher incomes and a taste for a higher quality environment. But still more important is to achieve the full internalization of resource costs and environmental costs, and thus cut off unsustainable activities before they need to be cleaned up. [Otherwise we will be caught up in a never ending cycle of "rectification of avoidable error".]

Smith (1992) notes that the Tokyo Round introduced explicit reference to the "environment" in setting out possible exceptions to GATT rules. The WWF in a recent paper proposes that such reference should be written explicitly into the GATT itself, and specifically into article xx.

### 3. POSSIBILITY OF COMMON ENVIRONMENTAL CONCERNS BEING ADDRESSED WITHIN AND THROUGH NAFTA

There has been a lot of commentary on NAFTA thus far; the "environment" has now emerged as a major topic. More generally trade/environment issues are becoming the contemporary challenge. But presently these issues are too much dominated by trade policy and notions of sovereignty.

On the issue of a North American Free Trade Agreement there has already accumulated a great deal of literature [ refs. Hart, CD Howe, Murray Smith, Conference volumes, BC consultation documents, etc.]

On the more particular question of trade and environment, there is also beginning to accumulate a vast literature. The issue is being addressed by a GATT working party and OECD studies, and is a major topic for discussion at UNCED. Also a number of reports [IISD conference, GATT report,...]

Does NAFTA become the realization of the dire predictions enunciated by its critics or an opportunity for significant change? Is it possible to summon up the political will to limit growth, to achieve respect for human rights, to

attain social justice, to enshrine ecological rights and to entrench fair and ecologically sound employment?

We need to do a lot more than admit there is a problem (Aridis, 1992)

"All measures taken so far are Band-Aid solutions ... we need real solutions (Carbajal, 1992 )

"Future economic growth will compound existing problems unless specific steps are taken to integrate free trade and environmental protection. (Emerson, 1991)

Human rights, labour rights and environment deserve equal treatment with trade rights ( Axworthy , 1991,)

Within Canada, United States and Mexico there are laws, policies, and regulations in place which appear to preserve and protect the environment; yet industry is continually in non-compliance with these environmental provisions and government is continually violating its own policies by not enforcing regulations. Without a commitment to achieve enforceable means to attain a limit to growth, and without a commitment to set up an infrastructure to enforce regulations, the current North American situation which is now urgent will become irreversible.

The three countries negotiating the NAFTA all enunciate strong environmental objectives but will all three countries have the political will to ensure that there will be long term preservation and protection of the environment and to insist that such preservation and protection of the environment become an integral part of the NAFTA agreement? Will the government translate their rhetoric into action and ensure that high environmental standards will be enforced?

**Mexico:** President Salinas has expressed his commitment to the environment in the following way:

" Social liberalism therefore presupposes a State that promotes and encourages private initiative, but has the capability to firmly regulate economic activity and thus prevent the few from taking advantage of the many; a State that channels attention and resources towards meeting Mexicans' basic needs, is respectful of labor rights and union autonomy, and protects the environment." (Carlos Salinas de Gortari, Social Liberalism: Our Path, Mexico: On the Record. Vol. 1. No. 4 ( March 1992)

In March 1988, Mexico enacted its General Law for Ecological Equilibrium and Environmental Protection. It is a comprehensive statute designed to ensure that there is an

adequate legal basis for protecting the environment. Indeed, the law is based in large part on US. law and experience.

A central element of the 1988 law is the requirement for environmental impact assessments to be completed on all new investment projects; in both the public and private sectors. To ensure they comply with these requirements, many privately owned companies have already created special environmental offices to analyze the environmental impacts of proposed business activities. ( US. government publication] Free trade Negotiations with Mexico Environmental Matters, p. 3 )

In 1990.. the Government [of Mexico] shut down all 24 Military industrial installation in the Mexico City area because of potential environmental risks." ( Free trade negotiations with Mexico, Environmental matters, US. government publication]

**Canada:** The Canadian Government has expressed its concern for the environment through the objectives and goals of the "Green Plan".

"Canada's Green plan for a healthy environment is a co-ordinated package of actions to help Canadians work together in partnership to achieve, within this decade, a healthy environment and a sound , prosperous economy.

Canada's Green Plan is second to none in its comprehensive approach to a full range of environmental challenges, funding, accountability and provision for public involvement ,he [Minister of Environment, de Cotret ] added.

Canada's Green Plan offers new policies, programs and standards to clean up, protect and enhance our land, water and air, our renewable resources, the Arctic, parks and wildlife, and to reduce waste generation and energy use. it also includes measures to maintain global environmental security, foster environmentally responsible decision -making and improve our emergency preparedness....

Canada's Green Plan is a major step forward of our country. It greatly expands, organizes and focuses our environmental activities. It is an optimistic document about the future of our environment," Mr. de Cotret said. (Government of Canada's release " Federal Government releases environmental green plan" December, 1990.)

Goal

to ensure that citizens today and tomorrow have clean air, water and land essential to sustaining human health and the environment....p. 1 ....

Goal:

The balanced use of strong and effective environmental laws, with market-based approaches for environmental protection. p. 20

#### INITIATIVES

- Over the next five years, strengthen federal inspection, information exchange and investigation programs to better enforce environmental regulations ....

In 1991, develop and adopt a comprehensive Code of Environmental Stewardship covering all areas of federal operations and activities. The Code will be complemented by a list of targets on issues ranging from waste generation to contaminated sites clean-up and emission standards, establishment of an office of Environmental Stewardship and measures to ensure that federal purchasing policies and practices integrate environmental considerations.

Implementation of the code will ensure that the activities and operations of the federal government meet or exceed the standards and practices it is recommending for others. ( p. 21) Government of Canada's release " Federal Government releases environmental green plan" December, 1990.)

#### **United States:**

President Bush has also reiterated the United States' concern for the environment in the following letter to Congress.

"A NAFTA offers an historic opportunity to bring together the energies and talents of their great nations already bound by strong ties of family, business and culture. Prime Minister Mulroney and President Salinas are both leaders of great vision. They believe as do I, that a NAFTA would enhance the well-being of our peoples. They are ready to move forward with us in this unprecedented enterprise. In seeking to expand our economic growth, I am committed to achieving a balance that recognizes the need to preserve the environment, protect worker safety, and facilitate adjustment. ... At my direction, Ambassador Hills and my Economic Policy Council have undertaken an intensive review of our NAFTA objectives and strategy to ensure thorough considerations of the economic, labor and environmental issues raised by you and your colleagues. ....

#### Environmental issues in the NAFTA

- Protection of Health and Safety: We will ensure that our right to safeguard the environment is preserved in the NAFTA.

- we will maintain the right to exclude any products that do not meet our health or safety requirements and we will continue to enforce those requirements
- we will maintain our right to impose stringent pesticide, energy conservation, toxic waste, and health and safety standards
- we will maintain our right , consistent with other international obligations, to limit trade in products controlled by international treaties ( such as treaties on endangered species or protection of the ozone layer).
- Enhancement and Enforcement of Standards: we will seek a commitment to work together with Mexico to enhance environmental health and safety standards regarding produces and to promote their enforcement
- we will provide for full public and scientific scrutiny of any change to standards before they are implemented.
- we will provide for consultations on enhancing enforcement capability, inspection training, monitoring and verification
- we will consult on national environmental standards and regulations, and will provide an opportunity for the public to submit data on alleged non-compliance. (Response of the Administration to issues raised in connection with the negotiation of a North American Free Trade Agreement. May 1, 1991, p. 5)

The current global ecological crisis is urgent and a serious shift in perspective is necessary if the crisis is to be addressed. This shift in perspective must permeate all future considerations of trade and development related to the environment, health, human rights and social justice. Through this new perspective we must begin perceiving that the ecological preservation and protection must be given primacy and that an integral part of ecological preservation and protection is the correction of presently distorted market mechanisms.

The onus of proof would then shift from those objecting to increased growth and to potentially ecologically unsound interventions having to demonstrate harm to those advocating industrial interventions into the ecosystem having to demonstrate worth and safety.

All three of our countries have spent years enunciating the goal of protecting and preserving the environment. What we now need to do is achieve the highest attainable synthesis of our common goals in the coordination of policy in a North American community, not some lowest common denominator achieved through some process of mechanical compromise [ re - integrative bargaining—we need to achieve a bargaining set with sufficient diversity to be able to trade off objectives for one country in one area with goals for others in others. ]

Such standards should be related to environmental, social justice, human rights and health provisions. The enshrining of high standards conforms in principle to declared objectives of all three countries. These declared objectives are present not only in legislation from all three countries but also in many international covenants and declarations to which all three countries to varying degrees subscribe [have ratified] . These declared objectives are evident in the preamble to Bill C 13 (Environmental Assessment Review Act) in Canada, in the intent behind the Mexican Constitutional Law for the Ecological Equilibrium and Protection of the Environment and in the Standards set by the U.S. Environmental Protection Agency.

So I would like to ask whether NAFTA can provide a lead in a [more] fruitful direction which achieves a better reconciliation of the differing perspectives, situations and orientations of the different players and at the same time establishes high common standards. Differences in North America are not so great as in the world as a whole, and should be more easily bridged. All three countries share the same lofty rhetoric and indeed the same idealistic -- apparently potent -- legislation. All three fall down badly on implementation, on monitoring and on enforcement.

But all also can see the writing on the wall, and might be ready to turn around the decision structures and alter the priorities in the direction necessary to move towards sustainable development. All may be ready jointly to move against the threats of "jobs blackmail" and "competitiveness blackmail" which have stalled any realistic moves thus far towards adequate pricing of resources or adequate weighting of preservation and future interests.

Working together we may be able to reach meaningful agreements on measures to avoid both "the race to the bottom" in jurisdictional competition and cost associated with the "first over the top" fear. What is needed is strong political will to entrench high common standards and strong enforcement measures to be enshrined in a code of commitments that will be an integral part of the NAFTA.

So I am not here to wring hands about the threat posed by Mexico as a pollution haven in a North American community. (In fact, in many ways all of North America currently could be described as a pollution haven for industry) Rather, on the assumption that we will, for political reasons, have a little time before a final agreement is reached, I want to ask how we can use this lull to translate some of our nice rhetoric into realistic commitments to action within a trade agreement.

#### 4. POTENTIAL ROLE FOR NAMI IN ASSISTING IN THE ESTABLISHING THE HIGHEST ATTAINABLE SYNTHESIS OF OUR COMMON GOALS IN THE COORDINATION OF POLICIES IN A NORTH AMERICAN COMMUNITY

I would also like to suggest that perhaps NAMI could provide leadership in bringing together independent thinkers from all three countries to articulate a broader vision within which the process of economic integration might proceed. A model might be found in an independent group (the so-called "Group of Forty" which met in Stockholm in 1972, and at that time stated the following:

II There is a fundamental conflict between traditional concepts of economic growth and the preservation of the environment. During the last century, uncontrolled continuous growth in the industrial production of environmentally harmful substances and products in some regions of the world has produced dangerous amounts of pollution and has been responsible for an inordinate waste of resources. At the same time, an increasing concentration of economic power and industrial activity has led to a centralization within a few nations of the benefits from the use of the earth's natural resources, and the international political influence that is derived from the control of these resources. It has become clear that more rational distribution of industrial power is necessary if the global problems of environment and society are to be solved. Such a redistribution would achieve at the same time a more equal apportionment of economic and political benefits among nations and individuals.

III The exploitation of third World national and regional resources by foreign corporations, with a consequent outflow of profits from the exploited regions, has resulted in a vast and growing economic disparity among nations and ;a monopoly of industrialized countries over production, energy, technology, information and political power. Complementary to this is the flooding of developing countries with surplus goods and capital, with a resultant distortion of their economies, and the deformation of their environments into monocultures in the interest of further enriching the industrial states. The foreign investments, economic development and technological practices of such industrial states must be curbed and altered by the basic claim of a region's people to control of its resources. Use of these resources, however, should not be dictated ;by the accidents of geography, but must be allocated in such ways as to sere the needs of the world's people in this and future generations. The authority of any region's people over resources and environment includes the obligation to recognize that the environment is an indivisible whole, not subject to political barriers. The environment must be protected from

avoidable pollution, destruction and exploitation from all sources.  
( Earth Talk, 1972, p. 170)

Much conventional technology and many of its proliferating products have proved ecologically harmful. We cannot reject technology per se but must restructure and reorient it. Ecologically sound technologies will minimize stresses to the environment. A rapid development of the new approach should be complemented by a technology review and surveillance system to assure that any new technology is ecologically compatible and will be used for human survival and fulfillment. It is not enough to add anti-pollution devices to existing technologies, although this might well be the initial stage of phasing out present polluting technologies. ( Earth Talk, An Independent Declaration on the Environment, 1972)

## 5. CONCLUSION:

1) At the last NAMI meeting in November in Santa Fe, participants indicated that they were struck by "the speed at which the environmental issue has risen to the top of the NAFTA agenda". Throughout the past 20 years there have been numerous declarations related to the environment. These declarations reflect deep international concern, but, once passed, give only momentary relief to the anguish that the international community senses about the environment and then they sink into oblivion. International environmental standards have to be ratified and enforced. NAFTA needs to reflect the strong international principles that have been enunciated by the General Assembly in declarations. Such as "Historical Responsibility of States for the Preservation of Nature for Present and Future Generations ( UN Assembly Resolution 35/8 ( 1080); "Interrelationships between Resources, Environment, People and Development "( UN General Assembly Resolution 36/179. 1981); "International Cooperation in the Field of the Environment" ( UN General Assembly 36/192:, 1981); "World Charter for Nature" (UN General Assembly Resolution 37/7, 1981) and the World Conservation Strategy itself.

If we in a North American community are seriously to address the issue of the environment, NAFTA must embody a set of international principles and environmental objectives that can explicitly override or supersede the trade imperatives which otherwise drive our economic relationships.

2. As part of its role of "exploring ideas for increased cooperation among the peoples of the North American continent", NAMI — itself an independent/

informal community of commentators — should promote participation in a series of informal tripartite non-governmental consultations to establish a synthesis of high standards and an infrastructure to ensure that these standards are enforced.

3. Beyond agreed legislative standards, however, we must look to changing the underlying attitudes and values which drive economic decisions. We must work towards a new perspective or outlook for consumers and producers, where both consumers and producers will be socially and environmentally; individually and organizationally responsible. NAMI could make a serious contribution through its educational activities.

Ultimately, we need to move through participation and education to shape not just consumer-driven corporations but principle-driven corporations (the true 'socially responsible' green corporation), and not just interest-based negotiations but value-based consensus. It's a task we can all work on.

Muchas gracias

SYSTEMIC CONSTRAINTS:

- discrepancy between rhetoric and action
- discrepancy between regulations and enforcement
- Short-term changes as means to end
- False dichotomy between jobs and environment economic pressures and environment
- required or discretionary environmental assessment review coupled with non-arms length research to determine environmental impact
- misplaced onus of proof
- reluctance to cede sovereignty to global governance in urgent situation
- industrial hypocrisy

The British Columbia Federation of Labour (BCFL) also felt that free trade with Mexico would threaten the quality of life enjoyed in British Columbia and jeopardize the province's economic stability. The only advantage will be corporations' access to cheap labour. According to the respondent, Mexico will sell its cheap labour in order to attract foreign capital. The BCFL raised a number of other issues it felt should be addressed as part of the discussion on trilateral free trade: Mexico's low wages, anti-democratic union practices, the lack of environmental regulations and restrictions, unhealthy and dangerous working conditions and unprotected consumers. ( Ministry of Development, Trade and Tourism, 1991, p. 27.)

As Cuauhtemoc Cardenas put it to the B.C. Federation of labour last November, "an alternative to the proposed free trade agreement should include a social charter and be based on common standards for labour, social and environmental rights. A different pact would strengthen our internal struggle for democracy and improve the situation of human rights of Mexicans in Mexico and the United States." ( Salazar, J. 1991, p. 39)

Environmental problems are probably the most pressing with regard to the health and well-being of the Mexican workers. The Rio Grande, on which hundreds of communities on both sides of the US Mexico border depend for drinking water, is deluged by industrial waste, uranium mining runoff, hazardous spills from trans-border transport, agricultural chemicals and millions of gallons a day of untreated Mexican raw sewage. Lax environmental standards that allow this to happen are also what attracts U.S. and now Canadian companies to the border zones to do business.( Northcotte, 1991, p. 31 )

According to the US based Coalition for Justice in the Maquiladoras, the damaging characteristics of the maquiladoras, environmental contamination, unsafe working conditions and the exploitation of workers, have shattered the quality of life in the border communities. " ( Northcotte, V. 1991, p. 31)

Although Mexico claims that it will not become an environmental haven, the general industrial perception is that, at least in the short term it will be one. The possibility of Mexico's becoming [ or becoming more of ] an environmental haven is reiterated in the section on Environmental and Pollution Control in the Ministry of Development and trade and tourism report on BC. consultations with the private sector re.: Mexico, Canada and the United States: the trilateral free trade proposal.

" Environmental regulations on businesses operating in Mexico are expected to be less stringent than they generally are for operations in British Columbia or the United States. At least initially, therefore, Mexico will be more attractive for locating new industries with pollution concerns than in British Columbia or U.S. jurisdictions. This likely will not be significant in the long term but initially it will result in some impact on the British Columbia industry. " ( Ministry of Development, Trade and Tourism, June 1991, p. 24)

The new perspective must move away from "pollution concerns" being the concerns that industry has when they have to abide by stringent regulations to being the concerns that the community has about the preservation of the ecosystem. the new perspective must also move away from considering "impact" as being economic impact to considering "impact" as being ecological impact.

[Environmental provisions necessary to prevent either one of the three countries from becoming an environmental pollution haven  
Environmental provisions to ensure that the highest tenable principles are in place to ensure that neither one of the three countries becomes an environmental pollution haven. ]

As Cuauhtemoc Cardenas put it to the B.C. Federation of labour last November, "an alternative to the proposed free trade agreement should include a social charter and be based on common standards for labour, social and environmental rights. A different pact would strengthen our internal struggle for democracy and improve the situation of human rights of Mexicans in Mexico and the United States." ( Salazar, J. 1991, p. 39)

All of our three countries appear to agree on what is needed to be done .  
Now we must ensure that what needs to be done , is done.

iii. The discrepancy between government and industry rhetoric embodied in laws and regulations and the political will to enforce these regulations.

iv. The discrepancy between institutional rhetoric embodied in publications and the traditional role that is played by the institution ( the usurping of the environmental movement to the point of making it redundant)  
(see "Eco-development" in Colby, M., Environmental management in development; the evolution of paradigms, 1990, World Bank discussion papers V. 39)

vi. The advocating of self regulation by industry; the moving away from compliance, imposed regulations etc.

QUOTE FROM SESSION AT GLOBE 92

vii. The discarding of the principle of arms-length research in industrial projects

The Royal Bank conveys in Econoscope, that " the new rules [in Mexico] automatically allow 100% foreign ownership of Mexican companies provide that less than US100 million is involved and that certain other criteria are met ( for example, the funds must come from abroad and the investment must not be in areas which are already industrialized) (Royal Bank of Canada p 4.)

Note: no mention of safe industry

The move towards a free trade agreement with the United States is seen by the Mexican government as a powerful tool to modernize its economy. Such an alliance leading to a greater integration of Mexico into the North American economy could provide an anchor of stability for Mexico's monetary and fiscal policies. (Royal Bank of Canada p. 4)

....On the plus side, the United States will find that an improved Mexican economy, particularly if it can help to reduce the flow of economic refugees into the United States, and improved co-operation on narcotics and the environment sufficiently compelling reasons to pursue free trade talks. The greater competition offered by Mexican low-cost labour-intensive products had to be kept in perspective. A central tenet of international trade theory is that countries specialize in the production and export of goods according to comparative advantage rather than absolute advantage.

Man developing countries have failed to convert their advantages with respect to plentiful and cheap labour into a comparative advantage because of a number of factors impeding overall labour productivity. (Royal Bank of Canada p. 9)

...For Mexico the comparative advantage offered by low-cost labour is offset to a certain extent by the lower level of manufacturing productivity except perhaps for the most recent manufacturing plants built in the in-bond maquiladora sector). Moreover, Mexico is faced with a number of other problems such as heavy state involvement, absenteeism and poor transportation and communication infrastructures. ( Royal Bank of Canada p. 11)

NOTE mention of pollution controls

There are several areas in which Canadian expertise could find a market in Mexico. These include agriculture, fishing, forestry and pollution control. Royal Bank of Canada p. 11  
[Note the only mention of anything that is related to the environment is the possibility of a market for Canadians in pollution control.]

On the issue of whether or not 'export protectionism' would grow, one must ask what the multinational corporations want to use the spoke countries for. Do they want them as markets or as production bases? If they want them as export markets, the multinationals would then favor export protections. If, however, they want them as production bases (as is increasingly the case with Mexico) then the multinationals gain no advantage from maintaining export protections. (Weintraub, Sidney, in Hill, R. et al 1991, p. 9)

...the multinational might well prefer an expanding free trade area to rationalize their production. ...U.S. multinationals have distribution systems set up to take advantage of the preferences it provides, they may well want it to continue. (Wonnacott, R. in Hill, R. et al 1991 p. 9)

First, it sets a timetable that lends itself to the 'Yankee trader' attitude that you cannot conclude a deal until the deadline (indeed after the deadline) because if a deal is reached earlier, it is because you have not squeezed enough and ended up leaving money on the table. Mexican negotiators have not experienced this, but they soon will...Second, the fast-track process lends itself to some very damaging side deals between the administration and Congress. In the Canadian case, while approval was given for the process by Congress, the price was a side deal whereby the administration essentially promised to restrict the Canadian forest products industry in any way it could. It did so with trumped-up cases against cedar shakes and shingles and softwood lumber. (Ritchie in Hill, R. et al 1991, p. 11)

#### To increase Canada's Weight in Settling Trade Disputes

A trilateral resolution of disputes would provide Canada and Mexico together with greater weight in holding the United States to its commitments than either would have alone. But for precisely this reason, it is far from clear that the United States would accept the trilateralizing of dispute settlement. ...Nor is it even clear that Canada would wish to trilateralize dispute settlement, since this could weaken, rather than strengthen, Canada's voice in disputes with the United States where Mexico did not support Canada's position. (Wonnacotte, R.J. "Canada

and the U.S. - Mexico Free Trade Negotiations." Commentary. No.21, September 1990. C.D Howe Institute p. 3)

To Have a Low-Wage Partner in the Free Trade Bloc

" Finally, Canada, like the United States, needs a low-wage partner such as Mexico. Every other participating country in a free-trade bloc has such a partner. Without access to a pool of low-wage labor, Canadian industry will find it more difficult to remain competitive in world markets. However, low wages in Mexico will raise the question: How can Canadian industry compete with cheap Mexican labor? .Wonnacotte, R.J. "Canada and the U.S. - Mexico Free Trade Negotiations." Commentary. No.21, September 1990. C.D Howe Institute. p. 4

Fear of trade with low-wage Mexico

One major fear will be that Canadians cannot risk trading freely with Mexico because of that country's cheap supplies of labour, which will give Mexican goods an overwhelming competitive advantage. ....If we really had to worry about the competitive advantage conferred by low Mexican wages, then existing Canadian tariffs would provide little relief: if 'sixty-cent-an-hour wages' are a threat, then 'sixty-six cent-an-hour wages' are not much less of a threat. .... What matters in international competition is ;not how ;much local labor is paid in terms of purchasing power. What matters is how unit costs of production compare internationally at the going exchange rates. (Lipsey, R. "Canada at the U.S. -Mexico Free Trade Dance." Commentary. No.20, August 1990. C.D Howe Institute p. 10).

...Observaciones: El esfuerzo di Gobierno en el combate a la contaminacion comprende acciones que abarcan a todos los sectores de la sociedad, las cuale han sideo aplicadas con gran efectividad gracias al esfuerzo y al desarrollo de la conciencia ecological del la poblacion con su conjunto. ( documentation sent by Consulat of Mexico, latest news from April 12 and April 13 related to the environment)

The Government of Mexico's three year environmental plan for the border communities calls for a doubling of the number of inspectors from the Secretariat of Urban Development and Ecology (SEDUE) by January 1992. This represents a four-fold increase from 1989. "By January 1992, The SEDUE team of 200 qualified inspectors will be ensuring that industries in the border communities adhere strictly to Mexico's environmental laws and regulations. Businesses that refuse or cannot comply will be subject to penalties, including having their operations shut down. Information and data systems are being upgraded and decentralized. These improvements will allow for closer monitoring of raw materials and dangerous wastes.

Already, in the last three years, almost 1 million tons of hazardous materials have been prohibited from entering Mexico. Progress can already be seen in the "maquiladora" industries where compliance with regulations on operating licenses, on the declaration of the production of hazardous wastes and on the proper disposal of hazardous wastes has increased dramatically since 1989. All existing maquiladora plants must be entirely re-certified by 1992. All new investment must present environmental impact statements. ("Protecting the Environment Mexico's public works program for the Border Region," undated, and unsigned document )

Mexico and the United States are committed to a cooperative program that will encourage sustained economic growth and environmental protection in both countries. President Bust and president Salinas believe that the two are complementary and must be pursued together. ( Free trade Negotiations with Mexico Environmental matters, p. 1 )

Mexico has established a good basis for progress on environmental protection and conservation of natural resource. President Salinas states that, while seeking to stimulate foreign investment, Mexico will not accept investments that have been rejected by the United States or Canada for environmental reasons. ( U.S. government publication] Free trade Negotiations with Mexico Environmental matters, p. 2 )

Convenio con las industrias en el valle de Mexico para combatir la contaminacion ambiental

Por su parte el jefe del Departamento del Distrito Federal, Manuel Camacho Solis, explico las medidas tomadas en el pacto con la industria, entre las que destacan las siguientes;

- establecer la verificación obligatoria de las emisiones industriales, principalmente de las partículas de monóxido de carbono, azufre, óxidos de nitrógeno, plomo, hidrosulfatos y compuestos orgánicos volátiles para lo cual en un plazo máximo de 18 meses, 220 empresas que consumen el 53% del total de combustibles en el valle de México deberán contar con equipos anticontaminantes
- se integra un programa de capacitación de inspectores, auditores y verificadores, así como operadores de calderas y equipos de combustión.
- Se crea un cuerpo especial de inspección y asesoría profesional en la materia, y que actualmente las partículas de origen industrial son las de mayor riesgo para la salud, pues contienen químicos inorgánicos y metales pesados y constituyen el 65% de las partículas tóxicas suspendidas en el aire.

- se otorgara asesoria y equipo tecnologico a la industria para ue instale equipos anticontaminantes
- se desarrollaran politicas de energia ( ahorro, consumo racional, entre otras), ademas de que se controlaran y reformularan solventes de pinture
- Se cuenta con un billn de pesos para financiar el control de emisiones, cambiar procesos y descentralizar industrias,. Es importante se? alar que por primera vez en un programa de esta naturaleza intevienen siete bancos comerciales: Multibanco Mercantil d Mexico, Banca Serfin, Banca Confia, Bancomer, Banco Internacional, Multibanco Comermex y Banco BCH, asi como ocho arrendadoras.

Note: Need for sustained monitoring and implementation of regulations cannot only be implemented as a means to an end. Implementation of standards and regulations as a means to an end, without the provisions in place, continue to impose implement these regulations.. relax regulations

- SE continuaran actualizando y desarrolando nors cada vez mas estrictas para la industria, hasta alcanzar reducciones en la emision de paticulas entre un 70 y 90%

...Observaciones: El esfuerzo dl Gobierno en el combate a la contaminacion comprende acciones que abarcan a todos los sectores de la sociedad, las cuale han sideo aplicadas con gran efectividad gracias al esfuerzo y al desarrollo de la conciencia ecological del la poblacion con su conjunto. ( documentation sent by Consulat of Mexico, latest news from April 12 and April 13 related to the environment)

Whereas the Government of Canada in demonstrating national leadership should establish national environmental quality objectives, guidelines and codes of practice. ( Canadian Environmental protection act, 1988)

Whereas toxic substances, once introduced into the environment, cannot always be contained within geographic boundaries ( Canadian Environmental protection act, 1988) section 2. a Government of Canada shall... take both preventative and remedial measures in protecting the environment. ( Canadian Environmental protection act, 1988)

In the Department of the Environment Act, under the division of "Powers, duties and functions of the Minister , it is stated that "the duties of the Minister include providing for:

- a) the preservation and enhancement of the quality of the natural environment, including water, air and soil quality; and to

2(i) endeavour to protect the environment from the release of toxic substances". (Canadian Environmental Protection Act, 1988, C 22)

[" deleterious substance means:

a) any substance that, if added to any water would degrade or alter or form part of a process of degradation or alteration of the quality of that water so that it is rendered or is likely to be rendered deleterious to fish or fish habitat or to the use by man of fish that frequent that water

(Fisheries act, statutes of Canada 1976077, c35)

yet raw sewage is still dumped into the waters around Vancouver Island and fish have lesions ]

" whereas... no present activity should compromise activities... fulfill the needs of future generations

Based on my discussions with President Salinas, I am convinced that he is firmly committed to strengthened environmental protection, and that there is strong support for this objective among the Mexican people. Because economic growth can and should be supported by enhanced environmental protection, we will develop and implement an expanded program of environmental cooperation in parallel with the free trade talks. ...thus, our efforts toward economic integration will be complemented by expanded programs of cooperation of labour and the environment." (Letter from George Bush to Chairman Rostenkowski and Majority Leader Gephardt; similar letter sent to every member of Congress, May 1, 1991)

Mexico's commitment to environmental protection

- Mexico has no interest in becoming a pollution haven for U.S. companies.
- Mexico's comprehensive environmental law of 1988, which is based on U.S. law and experience, is a solid foundation for tackling its environmental problems.
- All new investments are being held to these higher legal standards and an environmental impact assessment is required to show how they will comply.
- Enforcement has in the past been a key problem, but Mexico's record has been improving dramatically. Since 1989, Mexico has ordered more than 980 temporary and 82 permanent shutdowns of industrial facilities for environmental violations; the budget of SEDUE ( Mexico ' EPA) has increased almost eight-fold

Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991)

Direction to proceed is spelled out in McDorman analysis: need international agreement on priority for environmental objectives sufficiently strong that it formally and explicitly over-rides GATT where necessary.

Want to look closely at the US\_Mexico GATT panel report as outlined by McDorman

This shift in perspective must move away from perceiving that states have "the sovereign right to exploit their resources pursuant to their own environmental and developmental policies [and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other states or of areas beyond the limits of national jurisdiction." (Principle 2 in the Rio Declaration on Environment and Development)] . This shift in perspective must move away from perceiving that states have " the right to development [being fulfilled ] so as to equitable meet developmental and environmental needs of present and future generations" ( Principle 3 in the Rio Declaration on Environment and Development).

... few clauses from existing RIO declaration draft about prohibitions against use of environmental regulations as trade barriers, etc.

[to look at different sources of conflict associated with scarcity of exhaustible resources and struggles over shares of renewable resource in which everyone is racing to be first to harvest stocks; in which no one is investing enough to assure any kind of sustainability of renewability]

The advocating of a new found role of international governance for industry as a potential replacement for government.

Ramphal at Globe 92 described the new found role as " enlightened long-term thinking": He described the newly found enlightenment in the following way:

The private sector has been traditionally regarded as trammelled by short-term profit considerations. Enlightened long-term thinking was a preserve of the State, of governments. Today the greatest flaw in governance at the national level is the ascendancy of the short-term in the political calculus, as leaders respond frenetically to democratic pressures for immediate results. It is the private sector, and particularly the larger

enterprises within it, that have the intellectual space to think beyond tomorrow. ... ( Ramphal, S. 1992)

iv. The revealing of the true intent by industry in in-house documents.????  
from statements from industry about industry's perceived advantages of tripartite free trade.

McCrae, Jim World Bank Environmental division CHECK  
"dirty technology belongs in third world"  
Basle convention related to third world dumping

He reports that the panel found that "the obligations owed by the US to Mexico under GATT prohibited use of trade measures to deal with such environmental issues [ i.e. those having effect beyond the borders of the country adopting the trade measures]. This conclusion flows from the fact that GATT may regulate conditions around product, but not around means of production, and from the view that it is still possible to talk about the actions of a particular country affecting its environment. With these orientations, GATT can conclude that "Countries cannot look behind a good to determine if the production or manufacturing process was environmentally friendly. Or in other words countries cannot impose their environmental standards or regulations on other countries by boycotting their goods. "to a certain extent, this is what comparative advantage is all about: differences in their environment of production, including the environment of government regulations".

If this is true, how do we deal responsibly with environmental concerns in an emerging North American community in which sovereign communities still wish to pursue their own vision of interpersonal and inter-generational equity and sustainability?

*The point is to establish clearly the prior international understanding on the primacy of the environmental concern. Protecting the ecological systems on which we all depend must be the foundation for other relationships. We must cast the requirements of sustainability [sustaining the environment] as the starting point for any negotiations on trade policy or economic activity. "The environment" —particularly the renewable resource base, the ecological systems and the gene pool — represents the trust fund and the core asset — which has to be preserved throughout all our other activities.*

( ) **THAT** in February 1<sup>st</sup>, I contacted the Ministry of Environment and Forestry, to ask about the enforcement of section 59 and 60 of the Forest Act. I then went through Freedom of Information and was told that it would take 150 hours to respond to my question about how often the act had been enforced,

and that I would have to pay 30 per hour research after a given number of hours. I realized the discriminatory nature of the Freedom of information Act because if the information was readily available there would be little cost; however, if the information should have been available but was not, and had to be generated then only those with money could pay for the number of hours of work to generate the information. I was told that I could file a subsequent complaint to the Freedom of Information Commissioner, and argue that the information that I was seeking should have been compiled. I sent the letter. I was then contacted about reducing my request to how often have the sections in the Act been applied to MacMillan Bloedel within a given year.

I was particularly astonished that the representative in the Department of Environment, who had been responsible for implementing environmental regulations for twenty years, did not even know that the sections existed.

## EXHIBIT

1992 FEBRUARY 1

Editor

In response to the invoking by McMillan Bloedel and Fletcher Challenge of a little-known appeal procedure in the Forest Act, I would like to suggest that the Minister of Forests invoke two also little-known provisions in the Forest Act: Section 59 and section 60 which are related to the suspension of rights

59 (1) subject to section 60 and in addition to any penalty under this Act or the regulations, the regional manager or district manager may suspend, in whole or in part, rights in an agreement where its holder

a) made a material misrepresentation, omission or misstatement of fact in his application for the agreement or in information furnished with it:

60 The regional manager, a district manager or a forest officer authorized by either of them may, by written order and without notice suspend in whole or part the rights under an agreement where he believes on reasonable and probable grounds that its holder has failed to comply with the Act or the regulations, and that the failure of performance or compliance is causing or may imminently cause serious damage to the natural environment.

At the 1990 NDP Convention, the delegates, through resolutions related to sustainability, unanimously decried the Social Credit Government for "destroying irreplaceable landscapes, disrupting wildlife, ruining watersheds and damaging fisheries" (1990, p. 11, "Towards a sustainable Future.")

The culprit was identified as the sanctioning of non-ecologically sound logging practices; the victim; the public's present and future ecological rights.

Non-ecologically sound logging practices, prevalent during the Social Credit administration are currently allowed to persist in the NDP administration, and may continue while the newly formed Commission deliberates.

Four months ago, members of the ERA Ecological Rights Association filed a complaint with the Ombudsman's office about the violation of ecological rights brought about by the Ministry of Forests non-compliance with the Forest

Act. The Ombudsman's office is currently investigating how the non-compliance or unfair compliance by the Ministry of Forests has compromised ecological rights.

For years dedicated environmentalists and concerned foresters in different regions of B.C have been compiling data on specific instances of non-compliance to the Forest Act. For this complaint we are gathering evidence from throughout the province to demonstrate the continual destruction through non-ecologically sound logging practices of the natural environment, and to demonstrate examples of misrepresentation which may have been used to support the granting of permission to use non-ecologically sound logging practices.

Non-ecologically sound logging practices have destroyed and continue to destroy the natural environment.

Yet, the Minister of forests has failed and continues to fail to invoke section 60 of the Forest Act which allows for suspension of licenses.

"Where the holder has failed to perform an obligation to be performed by him under the agreement or has failed to comply with this Act or the regulations, and that the failure of performance or compliance is causing or may imminently cause serious damage to the natural environment." (Section 60 Suspension by officer, Forest Act, 1988).

Non- ecologically sound logging practices have been condoned even though permission to engage in non-ecologically sound logging practices may have been obtained through misrepresentation of information to the public. During the public viewings, often companies give the impression through visual displays, which are more accessible to the public than the actual display of the Management and working plans, that the companies will be engaging in ecologically sound practices. In the visual displays there is often "the-protected-fawn-in-the-forest," "the-single-logger-in-a-fully-treed-forest," and the "the-simulation-of-a-small-clear-cut." The public is left with the impression that ecologically sound logging practices will be engaged in.

Yet, the Ministry of Forest fails to invoke section 59 which allows the district manager" to suspend, in whole or in part, rights in an agreement where its holder a) made a material misrepresentation...."(Section 59, Suspension and Cancellation, Forest Act.

One of the outcomes of the investigation by the ombudsman's office hopefully will affect the compensation to companies when sections of the TFL are permanently set aside for wilderness.

"La nueva ecologia en Norte America"

"NAFTA, a "realization of dire predictions" or an opportunity for significant change: environmental implications."

Dobell, R. and J. Russow

MARCH 30, 1992

Paper presented by Rod Dobell  
at the NAMI meeting, April, 1993

WORKING PAPER: DRAFT  
INTRODUCTION

Un dia, espero estar capable de comunicar en Espanol. Hasta esto momento, yo quiero decir solamente algunas palabras en Espanol para expressar mi gusto en estar aqui in Mexico y en assistir a questa conferencia.

When we look at the way human populations now act and interact as part of ecological structures, it is probably not unreasonable to treat North

America as an ecosystem in itself, linked together both through the dynamics of natural system and through economic relationships.

The thread of my reasoning here in this brief paper is very simple:

1. There have been a lot of concerns expressed about NAFTA as a threat to social goals, including environmental goals, in all three countries.
2. All three countries of North America have expressed their environmental objectives very clearly (although implementation often does not follow), and want to see them respected in trade arrangements.
3. The GATT tradition is different. From experience with GATT and other trade deals, it seems clear that environmental objectives have to be explicitly addressed within NAFTA.
4. NAMI might help in educational efforts and in animating a broad consensus on strong environmental provisions within NAFTA"

But the problem is being approached from the wrong direction at the moment. The difficulty is that NAFTA negotiations are in the hands of trade policy people. These policy people work from a very strong tradition of economic analysis, and they are out to slay a particular dragon—the dragon of *protectionism*.

This view of the problem sees the solution as writing "trade rules governing environmental measures".

But I want to argue that this whole approach is backwards. The starting point is the need to assure the integrity of the ecological systems of the planet. At our scales of population and economic activity, it is no joke to say that the life-support systems on which we all depend are truly at risk.

We must therefore shape our trade policy, like all our other economic policy, within some over-riding agreed framework of environmental ground rules.

Therefore, I want to talk about trade and environment questions involving the three countries of North America. In particular, I should like to discuss briefly with you the way in which the conflicts between trade values (the goal of unimpeded flows of goods and all) and environmental values (pursuit of a sustainable society through conservation of resources and preservation of biodiversity) might be resolved within the emerging North American community.

I start from the premise that economic integration is occurring, and will continue. The domain of the economy is now the globe (even if the domain of the polity still reflects much smaller communities). It is not desirable or sensible to fight this process — the big cliché of the Canada-US FTA debate

(that "the status quo is not an option") is surely equally correct in relation to the on-going NAFTA negotiations. We can, however, and — in my view we must, however, resist the tendency toward unlimited growth and the perceived mandate for development even at the expense of social or environmental goals. Economic integration will occur but needs to be channeled and guided by some agreed synthesis of common high environmental goals.

In all our three countries citizens and organizations are concerned about the apparently unquestioned imperative to grow, the relentless destruction of the environment, rapidly increasing loss of ecological heritage, and increasing disenfranchisement and poverty. Citizens are also concerned about arriving at solutions to these problems.

## 1. CONCERN ABOUT NAFTA

These concerned citizens look with trepidation on the proposed trilateral trade agreement. For different reasons they see it as a threat:

### i. The growth imperative.

There is reluctance in political and industrial circles to address the need to limit growth and over-consumption, and a concomitant reluctance to acknowledge the implications, both social and economic of violating those limits.

In the process of wrapping the semantic capsule 'sustainable development' around this potentially unpalatable two sided world-view was born the genteel ploy of emphasizing the growth imperative for consumption in the South and the industrial communities comfortable with "business (much) as usual"; while focusing on sustainability for purposes of dealing with the increasingly strident and influential concerns of environmental movements and scientific bodies documenting the possible dangers of global change. Thus, there remains latent much of the old Stockholm debate between environmentalists and industrialist in the North and between developed nations of the North and developing nations of the South. (Dobell, 1992, p. 4)

Since our economies are growing and the ecosystems within which they are embedded are not, the consumption of resources everywhere has begun to exceed sustainable rates of biological production. Seen in this light, much of today's wealth is illusion derived from the irreversible conversion of productive natural capital into perishable human-made capital. (Rees, 1991, Draft. p. 9)

The result of unchecked growth has been the following:

Encroaching deserts (6 million ha/year; deforestation (11 million ha/yr of tropical forests alone); acid precipitation and forest dieback (31 million ha damaged in Europe alone); soil oxidation and erosion ( 26 billion tonnes/yr in excess of formation; toxic contamination of food supplies; draw-down and pollution of water tables; species extinction (1000s/yr); fisheries exhaustion; ozone depletion (5% loss over North America [and probably globally] in the decade to 1990); greenhouse gas build-up (25% increase in atmospheric CO<sub>2</sub> alone); potential climatic change ( 1.5-4.5C<sup>0</sup> mean global warming expected by 2040); and rising sea-levels (1.2-2.2 m by 2100) and like trends are the result of either excess consumption or the thermodynamic dissipation of toxic by-products of economic activity into the ecosphere ( Data from: Brown et al [Annual]; Brown and Flavin 1988; Canada 1988; WCRP 1990; Schneider 1990; US Environmental Protection Agency [reported in Stevens 1991]). ( reported in Rees, 1991, Draft. p. 11)

Continued development and growth has even been perceived as an inevitable fact of life by the president of the World Bank: in a recent speech, Barber Conable suggested that " a basic truth is that development cannot be halted, only directed". (Conable, 1989, p. 15)

ii. The trade policy imperative.

There is a discrepancy between the establishment of environmental policy through international commitments and the denial of the policy through free trade agreements:

In June 1988 both the US and Canada participated actively in a world conference on The Changing Atmosphere: Implications for Global Security. The conference concluded that global atmospheric problems were the product of 'an unintended, uncontrolled, globally pervasive experiment whose ultimate consequences could be second only to a global nuclear war.' and recommended national efforts to reduce carbon emissions by 20 % by the year 2005. .... yet later that year the Canada-US Free trade Agreement was ratified, entrenching energy and resource policies that are fundamentally at odds with the policy directions endorsed by representatives of the countries at the global warming conference. Under the terms of the free trade agreement; both countries forego, for as long as the agreement stands, the use of regulatory devices that could prevent the development of fossil fuel resources for export. ( Shrybman, S. 1990, p. 22)

There is also the compromising of the environment as a result of trade agreements:

It [NAFTA] may limit Canada's or British Columbia's authority to establish relatively tough environmental standards; and it may limit the public's access to decision-making affecting the environment during the negotiation of an agreement and the operation of such an agreement. Therefore, the association urged the government of British Columbia to:

- undertake an environmental assessment ( with full opportunity for public access to information and involvement) of the potential impact on British Columbia's environment and environmental decision-making process
  - insist that the federal government do the same; and
  - oppose any trade agreement with Mexico that:
    - i) would impair the province's ability to set relatively high environmental standards;
    - ii) does not specify that failure to establish and enforce reasonable environmental standards is considered to be a trade subsidy; or
    - iii) does not include mechanisms to facilitate public access to information regarding and public participation in, decision-making under the agreement
- ( Environmental Law Association , Ministry of Development, Trade and Tourism,1991 p. 23)

iii. The difficulty of translating negotiated agreements into enforceable action. There is a watering down of environmental resolve when action is required. For example a policy "to prevent pollution" frequently becomes translated into action "to reduce or mitigate pollution to the extent feasible and practicable" or "as appropriate" or words to that effect.

Compare, for example, conference statements like

12. The Ministers agreed that, in order to achieve ESID, industry initiatives should include the following objectives:
- a) Adoption of pollution prevention, the approach that prevents pollution at the source in products and manufacturing processes rather than removing it after it has been created ( UNIDO, 1992, p. 7)

with operating guidelines like-

the thrust of the world Bank's energy work is increasingly to promote development in the energy sectors of developing

countries while taking prudent steps to mitigate damage to the environment" (the World Bank, 1989)

## 2. ENVIRONMENTAL CONCERNS THROUGH INTERNATIONAL DISCUSSIONS

Thus we see that there are a number of discordant themes in the trade/environment area. We do, however, have general agreement on environmental goals.

Indeed, for at least twenty years we have engaged in fairly strong environmental rhetoric.

In June 1972 at the UN (Stockholm) Conference on the Human Environment the following statement was made and principles enunciated:

To achieve this environmental goal will demand the acceptance of responsibility by citizens and communities and by enterprises and institutions at every level, all sharing equitably in common efforts. Individuals in all walks of life as well as organizations in many fields, by their values and the sum of their actions, will shape the world environment of the future. Local and national governments will bear the greater burden for large-scale environmental policy and action within their jurisdictions.

This conference stated the common conviction that:

### Principle 1

Man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well being and he bears a solemn responsibility to protect and improve the environment for present and future generations...

### Principle 2:

The natural resources of the earth, including the air, water, land, flora and fauna and especially representative samples of natural ecosystems, must be safeguarded for the benefit of present and future generations through careful planning or management, as appropriate

### Principle 13:

In order to achieve a more rational management of resources and thus to improve the environment, States should adopt an integrated and co-ordinated approach to their development planning so as to ensure that development is compatible with the need to protect and improve the human environment for the benefit of their population. (Stockholm Conference on the Human Environment, June 1972)

Was this only rhetoric in 1972: empty words whose legacy of inaction we now have to face?

If we are to achieve significant change we must translate our rhetoric into realistic commitments to action.

Now in June of 1992 we are entering into a new world agreement, the "Rio Declaration on Environment and Development" at UNCED, and we have also been grappling with the GATT . [EXPAND] Do these recent international documents address environmental concerns or are these documents still just rhetoric?

## **UNCED**

Indications to date suggest that the discussions at UNCED will not resolve the basic tensions between environmental goals and economic principles [ecological rights and economic privileges]. The Draft text for the RIO Declaration [on the Environment and Development] reveals still far too strong an overhang of orientation to a model of the nation-state and national sovereignty and a reluctance to curb growth or to come up with international environmental standards, with an international court of environmental law, with the enshrinement of the right to a safe environment and to an environmental heritage, or with establishing any form of international environmental governance.

In principle 2. "States have, in accordance with the Charter of the United Nations and the principles of international law, the sovereign right to exploit their own resources pursuant to their own environmental and developmental policies, and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other States or of areas beyond the limits of national jurisdiction. ( 2 April 1992, Rio Declaration on Environment and Development]

In principle 3.

The right to development must be fulfilled so as to equitably meet developmental and environmental needs of present and future generations ( 2 April 1992, Rio Declaration on Environment and Development]

The Prep Com delegates also failed to define explicitly what is meant by development: it can be argued that there is a fundamental distinction between exploitative and humanitarian development. Even the chair of the drafting committee on "Rio Declaration on Environment and Development" continued to perpetuate the simplistic myth that the north is concerned about [only] the environment and the south is concerned about [only] development. (March 26, 1992, personal communication). Such claims overlook, of course, concerns embodied in declarations such as those in the "Constitutional Law

for the Ecological Equilibrium and Protection of the Environment"  
(Government of Mexico, 1988)

Not only have the delegates been reluctant to argue for an agreement which limits growth and gives the environment primacy within the sustainable development context, they have also failed to recognize more fundamental non-anthropocentric rights.

Principle 1 Human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature.

( 2 April 1992, Rio Declaration on Environment and Development]

## **GATT**

Other agreement such as GATT have NOT succeeded in resolving the tension between environmental goals and economic principles [ecological rights and economic privileges] by giving primacy to unimpeded flows of goods and all and ignoring environmental values (pursuit of a sustainable society through conservation of resources and preservation of biodiversity).

GATT is built on the premise of nation states and meaningful national borders. Indeed the whole apparatus of international law has to presume that the relevant actors are national governments.

GATT, as presently interpreted, fails to recognize the "power of governments to implement environmental regulation ..." and brings about "increased economic pressures to reduce environmental standards."  
(Comments by Rolfe, C. , "Environmental considerations regarding a possible Mexico-Canada Free trade Agreement," for the West Coast Environmental Law Association, February, 1991).

Each one of the three states involved in the current NAFTA negotiations has attempted to object to other states using high environmental standards to influence trade, and in each case GATT has supported the state seeking to object to high standards:

"The Canadian pulp and paper industry has urged Canada to challenge U.S. laws requiring the use of recycled fibre in newsprint." (Shrybman, 1991, p. 13). The Canadian government has argued that a US. Environmental Protection Agency rule banning the use of all forms of asbestos violates the US. Canada FTA and GATT( Eric Christensen, "Pesticide Regulations and International Trade", Environment, Vol. 32. No. 9, November, 1990, p 45)

The U.S. recently proposed in GATT negotiations that nations be prevented from adopting domestic pesticide standards more stringent than international standards. (Eric Christensen, "Pesticide Regulation and

International Trade", Mark Ritchie, "GATT, Agriculture and the Environment: The US Double Zero Plan, " The Ecologist, Vol. 20, No. 6, November, 1990, p. 214.)

The U.S.- based Non-Ferrous Metals Producers Committee is using the U.S.- Canada FTA to support its challenge to Canadian federal and provincial pollution control programs intended to reduce emissions from the Canadian smelting industry. ( Shrybman "Selling the Environment Short: an environmental assessment of the first two years of free trade between Canada and the United States", Canadian Environmental Law Association, January, 1991, p. 13)

(cited in Rolfe, Chris, Environmental considerations regarding a possible Mexico-Canada Free trade Agreement for the West Coast Environmental Law Association, February, 1991).

And Mexico ... When in 1990 the U.S. placed an embargo upon tuna products from Mexico, "Mexico complained that the tuna embargo was inconsistent with obligations owed to Mexico under GATT. The September 1991 report of a three-member panel of experts established pursuant to the third-party dispute settlement procedures of GATT determined that the American embargo on Mexican tuna, even though designed to conserve dolphins was inconsistent with the GATT ( McDorman, T. 1991, p. 2)

The GATT Panel stated that under the GATT " a contracting party may not restrict imports of a product merely because it originates in a country with environmental policies different from its own". ( US. Mexico GATT Panel, 3 September 1991, at paras 2.1-2.2). It is this statement that has been seen as the biggest problem with the "GATT Panel report from an environmentalist point of view. ( McDorman, T. 1992, p. 19). However, even the normally environmentally sensitive Nordic countries have indicated that a country is not free 'to require that imported products [be] produced as cleanly abroad as at home." ( EFTA members press convening of working party, 82 Focus- GATT Newsletter 2-3 (July 1991) Any other conclusion reached by the GATT Panel would allow certain countries to dictate to others what standards must exist and this would clearly be an invasion of a country's sovereignty. Moreover, as the Panel concluded, any other conclusion would permit trade only between countries with identical regulations and this would amount to a dismantling of the GATT. (McDorman, T., 1992, p. 19) CHECK CITATIONS PUT IN FOOTNOTES

The unwillingness to "impose standards" was underlined in the Venezuelan intervention when the delegate stated,

“Potentially, any nation could thereby justify unilaterally imposing its own social, economic or employment standards as a criterion for accepting imports. Any influential contracting party could effectively regulate the internal environment of others simply by erecting trade barriers based on unilateral environment policies.” ( The Venezuelan intervention in the U.S.- Mexico GATT Panel, note 3, at para. 4.27).

Rather than considering high standards an "imposition", perhaps we should contemplate, high standards as "the expression of collective will" . Given the recognized urgency of the global situation, the relevant goal should perhaps be the attaining of the highest tenable common standards so that at least within the North American context, through a strongly principled NAFTA, our energy could be directed toward moving upward to these standards rather than in using the GATT to condone and even foster lower standards.

Thus the goal of trade policy and GATT is almost the antithesis of the goal of international agreement on environmental standards.

GATT prohibits discrimination among like products according to their mode of manufacture. An environmental agreement, on the other hand, would like to discriminate strongly in favour of environment—friendly processes and production methods.

In the long run, the only way this can be effectively accomplished is by thorough-going resource pricing and internationalization of all environmental costs. But even then we need strong social ground rules, and government action to create a framework for the system expressing agreed environmental objectives and establishing a regulatory strategy to achieve them.

We must, in other word, assure that trade policy is the servant of our broader [environment] and development goals. Anything less than full environmental pricing must be seen as a trade-distorting subsidy and unacceptable in a liberal trading regime.

The point is to establish clearly some prior international understanding on the primacy of the environmental concern. Protecting the ecological systems on which we all depend must be the foundation for other relationships. We must cast the requirement of sustainability [sustaining the environment] as the starting point for any negotiations on trade policy or economic activity. "The environment" —particularly the renewable resource base, ecological systems and the gene pool — represents the trust fund and the core asset which has to be preserved throughout all our other activities.

The GATT argument, and the conventional economic argument, is that we have to become rich enough to be able to afford environmental protection, clean up, and a high quality of life.

The sustainable development argument, properly interpreted, seems to me almost exactly contrary. Of course trade liberalization is important and will help to generate higher incomes and a taste for a higher quality environment. But still more important is to achieve the full internalization of resource costs and environmental costs, and thus cut off unsustainable activities before they need to be cleaned up. [Otherwise we will be caught up in a never ending cycle of "rectification of avoidable error".]

Smith (1992) notes that the Tokyo Round introduced explicit reference to the "environment" in setting out possible exceptions to GATT rules. The WWF in a recent paper proposes that such reference should be written explicitly into the GATT itself, and specifically into article xx.

### 3. POSSIBILITY OF COMMON ENVIRONMENTAL CONCERNS BEING ADDRESSED WITHIN AND THROUGH NAFTA

There has been a lot of commentary on NAFTA thus far; the "environment" has now emerged as a major topic. More generally trade/environment issues are becoming the contemporary challenge. But presently these issues are too much dominated by trade policy and notions of sovereignty.

On the issue of a North American Free Trade Agreement there has already accumulated a great deal of literature [ refs. Hart, CD Howe, Murray Smith, Conference volumes, BC consultation documents, etc.]

On the more particular question of trade and environment, there is also beginning to accumulate a vast literature. The issue is being addressed by a GATT working party and OECD studies, and is a major topic for discussion at UNCED. Also a number of reports [IISD conference, GATT report,...]

Does NAFTA become the realization of the dire predictions enunciated by its critics or an opportunity for significant change? Is it possible to summon up the political will to limit growth, to achieve respect for human rights, to attain social justice, to enshrine ecological rights and to entrench fair and ecologically sound employment?

"We need to do a lot more than admit there is a problem." (Aridis, 1992)

"All measures taken so far are Band-Aid solutions ... we need real solutions" (Carbajal, 1992 )

"Future economic growth will compound existing problems unless specific steps are taken to integrate free trade and environmental protection. (Emerson, 1991)

Human rights, labour rights and environment deserve equal treatment with trade rights" ( Axworthy , 1991,)

Within Canada, United States and Mexico there are laws, policies, and regulations in place which appear to preserve and protect the environment; yet industry is continually in non-compliance with these environmental provisions and government is continually violating its own policies by not enforcing regulations. Without a commitment to achieve enforceable means to attain a limit to growth and without a commitment to set up an infrastructure to enforce regulations, the current North American situation which is now urgent will become irreversible.

The three countries negotiating the NAFTA all enunciate strong environmental objectives but will all three countries have the political will to ensure that there will be long term preservation and protection of the environment and to insist that such preservation and protection of the environment become an integral part of the NAFTA agreement? Will the government translate their rhetoric into action and ensure that high environmental standards will be enforced?

**Mexico:** President Salinas has expressed his commitment to the environment in the following way:

" Social liberalism therefore presupposes a State that promotes and encourages private initiative, but has the capability to firmly regulate economic activity and thus prevent the few from taking advantage of the many; a State that channels attention and resources towards meeting Mexicans' basic needs, is respectful of labor rights and union autonomy, and protects the environment." (Carlos Salinas de Gortari, Social Liberalism: Our Path, Mexico: On the Record. Vol. 1. No. 4 ( March 1992)

"In March 1988, Mexico enacted its General Law for Ecological Equilibrium and Environmental Protection. It is a comprehensive statute designed to ensure that there is an adequate legal basis for protecting the environment. Indeed, the law is based in large part on US. law and experience. A central element of the 1988 law is the requirement for environmental impact assessments to be completed on all new investment projects, in both the public and private sectors. To ensure they comply with these requirements, many privately owned companies have already created special environmental

offices to analyze the environmental impacts of proposed business activities." ( US. government publication] Free trade Negotiations with Mexico Environmental Matters, p. 3 )

"In 1990.. the Government [of Mexico] shut down all 24 Military industrial installation in the Mexico City area because of potential environmental risks." ( Free trade negotiations with Mexico, Environmental matters, US. government publication]

**Canada:** The Canadian Government has expressed its concern for the environment through the objectives and goals of the "Green Plan".

"Canada's Green plan for a healthy environment is a co-ordinated package of actions to help Canadians work together in partnership to achieve, within this decade, a healthy environment and a sound , prosperous economy. Canada's Green Plan is second to none in its comprehensive approach to a full range of environmental challenges, funding, accountability and provision for public involvement ," he [Minister of Environment, de Cotret ] added.

Canada's Green Plan offers new policies, programs and standards to clean up, protect and enhance our land, water and air, our renewable resources, the Arctic, parks and wildlife, and to reduce waste generation and energy use. It also includes measures to maintain global environmental security, foster environmentally responsible decision -making and improve our emergency preparedness....

Canada's Green Plan is a major step forward of our country. It greatly expands, organizes and focuses our environmental activities. It is an optimistic document about the future of our environment," Mr. de Cotret said. (Government of Canada's release " Federal Government releases environmental green plan December, 1990.)

#### Goal

to ensure that citizens today and tomorrow have clean air, water and land essential to sustaining human health and the environment....p. 1 ....

#### Goal

the balanced use of strong and effective environmental laws, with market-based approaches for environmental protection. p. 20

#### INITIATIVES

- Over the next five years, strengthen federal inspection, information exchange and investigation programs to better enforce environmental regulations ....

In 1991, develop and adopt a comprehensive Code of Environmental Stewardship covering all areas of federal

operations and activities. The Code will be complemented by a list of targets on issues ranging from waste generation to contaminated sites clean-up and emission standards, establishment of an office of Environmental Stewardship and measures to ensure that federal purchasing policies and practices integrate environmental considerations. Implementation of the code will ensure that the activities and operations of the federal government meet or exceed the standards and practices it is recommending for others." ( p. 21) Government of Canada's release "Federal Government releases environmental green plan" December, 1990.)

### **United States:**

President Bush has also reiterated the United States' concern for the environment in the following letter to Congress:

"A NAFTA offers an historic opportunity to bring together the energies and talents of these great nations, already bound by strong ties of family, business and culture. Prime Minister Mulroney and President Salinas are both leaders of great vision. They believe as do I, that a NAFTA would enhance the well-being of our peoples. They are ready to move forward with us in this unprecedented enterprise. In seeking to expand our economic growth, I am committed to achieving a balance that recognizes the need to preserve the environment, protect worker safety, and facilitate adjustment. At my direction, Ambassador Hills and my Economic Policy Council have undertaken an intensive review of our NAFTA objectives and strategy to ensure thorough considerations of the economic, labor and environmental issues raised by you and your colleagues."

#### **Environmental issues in the NAFTA**

- **Protection of Health and Safety:** We will ensure that our right to safeguard the environment is preserved in the NAFTA
  - we will maintain the right to exclude any products that do not meet our health or safety requirements and we will continue to enforce those requirements
  - we will maintain our right to impose stringent pesticide, energy conservation, toxic waste, and health and safety standards
  - we will maintain our right, consistent with other international obligations, to limit trade in products controlled by international treaties ( such as treaties on endangered species or protection of the ozone layer).
- **Enhancement and Enforcement of Standards:** we will seek a commitment to work together with Mexico to enhance

environmental health and safety standards regarding produces and to promote their enforcement

- we will provide for full public and scientific scrutiny of any change to standards before they are implemented.

-we will provide for consultations on enhancing enforcement capability, inspection training, monitoring and verification

- we will consult on national environmental standards and regulations, and will provide an opportunity for the public to submit data on alleged non-compliance. (Response of the Administration to issues raised in connection with the negotiation of a North American Free Trade Agreement. May 1, 1991, p. 5)

The current global ecological crisis is urgent and a serious shift in perspective is necessary if the crisis is to be addressed. This shift in perspective must permeate all future considerations of trade and development related to the environment, health, human rights and social justice. Through this new perspective we must begin perceiving that the ecological preservation and protection must be given primacy and that an integral part of ecological preservation and protection is the correction of presently distorted market mechanisms.

The onus of proof would then shift from those objecting to increased growth and to potentially ecologically unsound interventions having to demonstrate harm to those advocating industrial interventions into the ecosystem having to demonstrate worth and safety.

All three of our countries have spent years enunciating the goal of protecting and preserving the environment. What we now need to do is achieve the highest attainable synthesis of our common goals in the coordination of policy in a North American community, not some lowest common denominator achieved through some process of mechanical compromise [re-integrative bargaining—we need to achieve a bargaining set with sufficient diversity to be able to trade off objectives for one country in one area with goals for others in others.]

Such standards should be related to environmental, social justice, human rights and health provisions. The enshrining of high standards conforms in principle to declared objectives of all three countries. These declared objectives are present not only in legislation from all three countries but also in many international covenants and declarations to which all three countries to varying degrees subscribe [have ratified]. These declared objectives are evident in the preamble to Bill C 13 (Environmental Assessment Review Act) in Canada, in the intent behind the Mexican,

Constitutional Law for the Ecological Equilibrium and Protection of the Environment and in the Standards set by the U.S. Environmental Protection Agency.

So I would like to ask whether NAFTA can provide a lead in a [more] fruitful direction, which achieves a better reconciliation of the differing perspectives, situations and orientations of the different players and at the same time establishes high common standards. Differences in North America are not so great as in the world as a whole, and should be more easily bridged. All three countries share the same lofty rhetoric and indeed the same idealistic -- apparently potent -- legislation. All three fall down badly on implementation, on monitoring and on enforcement.

But all also can see the writing on the wall, and might be ready to turn around the decision structures and alter the priorities in the direction necessary to move towards sustainable development. All may be ready jointly to move against the threats of "jobs blackmail" and "competitiveness blackmail" which have stalled any realistic moves thus far towards adequate pricing of resources or adequate weighting of preservation and future interests.

Working together we may be able to reach meaningful agreements on measures to avoid both "the race to the bottom" in jurisdictional competition and cost associated with the "first over the top" fear. What is needed is strong political will to entrench high common standards and strong enforcement measures to be enshrined in a code of commitments that will be an integral part of the NAFTA.

So I am not here to wring hands about the threat posed by Mexico as a pollution haven in a North American community. (In fact, in many ways all of North America currently could be described as a pollution haven for industry) Rather, on the assumption that we will, for political reasons, have a little time before a final agreement is reached, I want to ask how we can use this lull to translate some of our nice rhetoric into realistic commitments to action within a trade agreement.

#### 4. POTENTIAL ROLE FOR NAMI IN ASSISTING IN THE ESTABLISHING THE HIGHEST ATTAINABLE SYNTHESIS OF OUR COMMON GOALS IN THE COORDINATION OF POLICIES IN A NORTH AMERICAN COMMUNITY

I would also like to suggest that perhaps NAMI could provide leadership in bringing together independent thinkers from all three countries to articulate a broader vision within which the process of economic integration might proceed. A model might be found in an independent group (the so-

called "Group of Forty" which met in Stockholm in 1972, and at that time stated the following:

II " There is a fundamental conflict between traditional concepts of economic growth and the preservation of the environment. During the last century, uncontrolled continuous growth in the industrial production of environmentally harmful substances and products in some regions of the world has produced dangerous amounts of pollution and has been responsible for an inordinate waste of resources. At the same time, an increasing concentration of economic power and industrial activity has led to a centralization within a few nations of the benefits from the use of the earth's natural resources, and the international political influence that is derived from the control of these resources. It has become clear that more rational distribution of industrial power is necessary if the global problems of environment and society are to be solved. Such a redistribution would achieve at the same time a more equal apportionment of economic and political benefits among nations and individuals.

III The exploitation of third World national and regional resources by foreign corporations, with a consequent outflow of profits from the exploited regions, has resulted in a vast and growing economic disparity among nations and ;a monopoly of industrialized countries over production, energy, technology, information and political power. Complementary to this is the flooding of developing countries with surplus goods and capital, with a resultant distortion of their economies, and the deformation of their environments into monocultures in the interest of further enriching the industrial states. The foreign investments, economic development and technological practices of such industrial states must be curbed and altered by the basic claim of a region's people to control of its resources. Use of these resources, however, should not be dictated by the accidents of geography, but must be allocated in such ways as to serve the needs of the world's people in this and future generations. The authority of any region's people over resources and environment includes the obligation to recognize that the environment is an indivisible whole, not subject to political barriers.

The environment must be protected from avoidable pollution, destruction and exploitation from all sources." ( Earth Talk, 1972, p. 170)

"Much conventional technology and many of its proliferating products have proved ecologically harmful. We cannot reject technology per se but must restructure and reorient it. Ecologically sound technologies will minimize stresses to the environment. A rapid development of the new approach should

be complemented by a technology review and surveillance system to assure that any new technology is ecologically compatible and will be used for human survival and fulfillment. It is not enough to add anti-pollution devices to existing technologies, although this might well be the initial stage of phasing out present polluting technologies." ( Earth Talk, An Independent Declaration on the Environment, 1972)

## 5. CONCLUSION:

1) At the last NAMI meeting in November in Santa Fe, participants indicated that they were struck by "the speed at which the environmental issue has risen to the top of the NAFTA agenda". Throughout the past 20 years there have been numerous declarations related to the environment. These declarations reflect deep international concern, but, once passed, give only momentary relief to the anguish that the international community senses about the environment and then they sink into oblivion. International environmental standards have to be ratified and enforced. NAFTA needs to reflect the strong international principles that have been enunciated by the General Assembly in declarations. Such as "Historical Responsibility of States for the Preservation of Nature for Present and Future Generations ( UN Assembly Resolution 35/8 ( 1080); "Interrelationships between Resources, Environment, People and Development "( UN General Assembly Resolution 36/179. 1981); "International Cooperation in the Field of the Environment" ( UN General Assembly 36/192:, 1981); "World Charter for Nature" (UN General Assembly Resolution 37/7, 1981) and the World Conservation Strategy itself.

If we in a North American community are seriously addressing the issue of the environment, NAFTA must embody a set of international principles and environmental objectives that can explicitly override or supersede the trade imperatives which otherwise drive our economic relationships.

2. As part of its role of "exploring ideas for increased cooperation among the peoples of the North American continent", NAMI — itself an independent/informal community of commentators — should promote participation in a series of informal tripartite non-governmental consultations to establish a synthesis of high standards and an infrastructure to ensure that these standards are enforced.

3. Beyond agreed legislative standards, however, we must look to changing the underlying attitudes and values which drive economic decisions.

We must work towards a new perspective or outlook for consumers and producers where both consumers and producers will be socially and environmentally , individually and organizationally responsible. NAMI could make a serious contribution through its educational activities.

Ultimately we need to move through participation and education to shape not just consumer-driven corporations but principle-driven corporations (the true 'socially responsible" green corporation), and not just interest-based negotiations, but value-based consensus. It's a task we can all work on.

Muchas gracias

## SYSTEMIC CONSTRAINTS:

- discrepancy between rhetoric and action
- discrepancy between regulations and enforcement
- Short-term changes as means to end
- False dichotomy between jobs and environment economic pressures and environment
- required or discretionary environmental assessment review coupled with non-arms length research to determine environmental impact
- misplaced onus of proof
- reluctance to cede sovereignty to global governance in urgent situation
- industrial hypocrisy

The British Columbia Federation of Labour (BCFL) also felt that free trade with Mexico would threaten the quality of life enjoyed in British Columbia and jeopardize the province's economic stability. The only advantage will be corporations' access to cheap labour. According to the respondent, Mexico will sell its cheap labour in order to attract foreign capital. The BCFL raised a number of other issues it felt should be addressed as part of the discussion on trilateral free trade: Mexico's low wages, anti-democratic union practices, the lack of environmental regulations and restrictions, unhealthy and dangerous working conditions and unprotected consumers. ( Ministry of Development, Trade and Tourism, 1991, p. 27.)

As Cuauhtemoc Cardenas put it to the B.C. Federation of labour last November, "an alternative to the proposed free trade agreement should include a social charter and be based on common standards for labour, social and environmental rights. A different pact would strengthen our internal struggle for democracy and improve the situation of human rights of Mexicans in Mexico and the United States." ( Salazar, J. 1991, p. 39)

"Environmental problems are probably the most pressing with regard to the health and well-being of the Mexican workers. The Rio Grande, on which hundreds of communities on both sides of the US Mexico border depend for drinking water, is deluged by industrial waste, uranium mining runoff, hazardous spills from trans-border transport, agricultural chemicals and millions of gallons a day of untreated Mexican raw sewage. Lax environmental standards that allow this to happen are also what attracts U.S. and now Canadian companies to the border zones to do business."( Northcote, 1991, p. 31 )

According to the US based Coalition for Justice in the Maquiladoras, "...the damaging characteristics of the

maquiladoras, environmental contamination, unsafe working conditions and the exploitation of workers, have shattered the quality of life in the border communities. " ( Northcotte, V. 1991, p. 31)

Although Mexico claims that it will not become an environmental haven, the general industrial perception is that, at least in the short term it will be one. The possibility of Mexico's becoming [ or becoming more of ] an environmental haven is reiterated in the section on Environmental and Pollution Control in the Ministry of Development and trade and tourism report on BC. consultations with the private sector re.: Mexico, Canada and the United States: the trilateral free trade proposal.

" Environmental regulations on businesses operating in Mexico are expected to be less stringent than they generally are for operations in British Columbia or the United States. At least initially, therefore, Mexico will be more attractive for locating new industries with pollution concerns than in British Columbia or U.S. jurisdictions. This likely will not be significant in the long term but initially it will result in some impact on the British Columbia industry. " ( Ministry of Development, Trade and Tourism, June 1991, p. 24)

The new perspective must move away from "pollution concerns" being the concerns that industry has when they have to abide by stringent regulations to being the concerns that the community has about the preservation of the ecosystem. the new perspective must also move away from considering "impact" as being economic impact to considering "impact" as being ecological impact.

[Environmental provisions necessary to prevent either one of the three countries from becoming an environmental pollution haven  
Environmental provisions to ensure that the highest tenable principles are in place to ensure that neither one of the three countries becomes an environmental pollution haven. ]

As Cuauhtemoc Cardenas put it to the B.C. Federation of labour last November, "an alternative to the proposed free trade agreement should include a social charter and be based on common standards for labour, social and environmental rights. A different pact would strengthen our internal struggle for democracy and improve the situation of human rights of Mexicans in Mexico and the United States." ( Salazar, J. 1991, p. 39)

All of our three countries appear to agree on what is needed to be done .  
Now we must ensure that what needs to be done , is done.

cut sections

iii. The discrepancy between government and industry rhetoric embodied in laws and regulations and the political will to enforce these regulations

iv. The discrepancy between institutional rhetoric embodied in publications and the traditional role that is played by the institution ( the usurping of the environmental movement to the point of making it redundant)  
(see "eco-development" in Colby, M., Environmental management in development; the evolution of paradigms, 1990, World Bank discussion papers V. 39)

vi. The advocating of self regulation by industry; the moving away from compliance, imposed regulations etc.  
QUOTE FROM SESSION AT GLOBE 92

vii. The discarding of the principle of arms-length research in industrial projects

The Royal Bank conveys in Econoscope, that " the new rules [in Mexico] automatically allow 100% foreign ownership of Mexican companies provide that less than US100 million is involved and that certain other criteria are met ( for example, the funds must come from abroad and the investment must not be in areas which are already industrialized)Royal Bank of Canada p 4.

Note: no mention of safe industry

The move towards a free trade agreement with the United States is seen by the Mexican government as a powerful tool to modernize its economy. Such an alliance leading to a greater integration of Mexico into the North American economy could provide an anchor of stability for Mexico's monetary and fiscal policies. (Royal Bank of Canada p. 4)

...On the plus side, the United States will find that an improved Mexican economy, particularly if it can help to reduce the flow of economic refugees into the United States, and improved co-operation on narcotics and the environment sufficiently compelling reasons to pursue free trade talks. The greater competition offered by Mexican low-cost labour-intensive products had to be kept in perspective. A central tenet of international trade theory is that countries specialize in the production and export of goods according to comparative advantage rather than absolute advantage.

Man developing countries have failed to convert their advantages with respect to plentiful and cheap labour into a comparative advantage because of a number of factors impeding overall labour productivity. (Royal Bank of Canada p. 9)

"...For Mexico the comparative advantage offered by low-cost labour is offset to a certain extent by the lower level of manufacturing productivity except perhaps for the most recent manufacturing plants built in the in-bond maquiladora sector). Moreover, Mexico is faced with a number of other problems such as heavy state involvement, absenteeism and poor transportation and communication infrastructures." ( Royal Bank of Canada p. 11)

There are several areas in which Canadian expertise could find a market in Mexico. These include agriculture, fishing, forestry and pollution control. Royal Bank of Canada p. 11  
[Note the only mention of anything that is related to the environment is the possibility of a market for Canadians in pollution control.]

On the issue of whether or not 'export protectionism' would grow, one must ask what the multinational corporations want to use the spoke countries for. Do they want them as markets or as production bases? If they want them as export markets, the multinationals would then favor export protections. If, however, they want them as production bases--as is increasingly the case with Mexico--then the multinationals gain no advantage from maintaining export protections. (Weintraub, Sidney, in Hill, R. et al 1991, p. 9)

...the multinational might well prefer an expanding free trade area to rationalize their production. ...U.S. multinationals have distribution systems set up to take advantage of the preferences it provides, they may well want it to continue. (Wonnacott, R. in Hill, R. et al 1991 p. 9)

First, it sets a timetable that lends itself to the 'Yankee trader' attitude that you cannot conclude a deal until the deadline (indeed after the deadline), because if a deal is reached earlier, it is because you have not squeezed enough and ended up leaving money on the table. Mexican negotiators have not experienced this, but they soon will...Second, the fast-track process lends itself to some very damaging side deals between the administration and Congress. In the Canadian case, while approval was given for the process by Congress, the price was a side deal whereby the administration essentially promised to restrict the Canadian forest products industry in any way it could. It did so with trumped-up cases against cedar shakes and shingles and softwood lumber. (Ritchie in Hill, R. et al 1991, p. 11)

#### To increase Canada's Weight in Settling Trade Disputes

"A trilateral resolution of disputes would provide Canada and Mexico together with greater weight in holding the United States to its commitments than either would have alone. But for precisely this reason, it is far from clear that the United States would accept the trilateralizing of dispute settlement. ...Nor is it even clear that Canada would wish to trilateralize dispute settlement, since this could weaken, rather than strengthen, Canada's voice in disputes with the United States where Mexico did not support Canada's position." (Wonnacotte, R.J. "Canada

and the U.S. - Mexico Free Trade Negotiations." Commentary. No.21, September 1990. C.D Howe Institute p. 3)

#### To Have a Low-Wage Partner in the Free Trade Bloc

" Finally, Canada, like the United States, needs a low-wage partner such as Mexico. Every other participating country in a free-trade bloc has such a partner. Without access to a pool of low-wage labor, Canadian industry will find it more difficult to remain competitive in world markets. However, low wages in Mexico will raise the question: How can Canadian industry compete with cheap Mexican labor? .Wonnacotte, R.J. "Canada and the U.S. - Mexico Free Trade Negotiations." Commentary. No.21, September 1990. C.D Howe Institute. p. 4

#### Fear of trade with low-wage Mexico

"One major fear will be that Canadians cannot risk trading freely with Mexico because of that country's cheap supplies of labour, which will give Mexican goods an overwhelming competitive advantage. ....If we really had to worry about the competitive advantage conferred by low Mexican wages, then existing Canadian tariffs would provide little relief: if 'sixty-cent-an-hour wages' are a threat, then 'sixty-six cent-an-hour wages' are not much less of a threat. .... What matters in international competition is ;not how ;much local labor is paid in terms of purchasing power. What matters is how unit costs of production compare internationally at the going exchange rates." (Lipsey, R. "Canada at the U.S. -Mexico Free Trade Dance." Commentary. No.20, August 1990. C.D Howe Institute p. 10).

"...Observaciones: El esfuerzo di Gobierno en el combate a la contaminacion comprende acciones que abarcan a todos los sectores de la sociedad, las cuale han sideo aplicadas con gran efectividad gracias al esfuerzo y al desarrollo de la conciencia ecological del la poblacion con su conjunto." ( documentation sent by Consulat of Mexico, latest news from April 12 and April 13 related to the environment)

The Government of Mexico's three year environmental plan for the border communities calls for a doubling of the number of inspectors from the Secretariat of Urban Development and Ecology (SEDUE) by January 1992. This represents a four-fold increase from 1989. "By January 1992, The SEDUE team of 200 qualified inspectors will be ensuring that industries in the border communities adhere strictly to Mexico's environmental laws and regulations. Businesses that refuse or cannot comply will be subject to penalties, including having their operations shut down. Information and data systems are being upgraded and decentralized. These improvements will allow for closer monitoring of raw materials and dangerous wastes. Already, in

the last three years almost 1 million tons of hazardous materials have been prohibited from entering Mexico.

Progress can already be seen in the "maquiladora" industries where compliance with regulations on operating licenses, on the declaration of the production of hazardous wastes and on the proper disposal of hazardous wastes has increased dramatically since 1989. All existing maquiladora plants must be entirely re-certified by 1992. All new investment must present environmental impact statements. ("Protecting the Environment Mexico's public works program for the Border Region," undated, and unsigned document )

"Mexico and the United States are committed to a cooperative program that will encourage sustained economic growth and environmental protection in both countries. President Bust and president Salinas believe that the two are complementary and must be pursued together." ( Free trade Negotiations with Mexico Environmental matters, p. 1 )

"Mexico has established a good basis for progress on environmental protection and conservation of natural resource. President Salinas has states that, while seeking to stimulate foreign investment, Mexico will not accept investments that have been rejected by the United States or Canada for environmental reasons." ( U.S. government publication] Free trade Negotiations with Mexico Environmental matters, p. 2 )

"Convenio con las industrias en el valle de Mexico para combatir la contaminacion ambiental

Por su parte el jefe del Departamento del Distrito Federal, Manuel Camacho Solis, explico las medidas tomadas en el pacto con la industria, entre las que destacan las siguientes;

- establecer la verificación obligatoria de las emisiones industriales, principalmente de las partículas de monóxido de carbono, azufre, óxidos de nitrógeno, plomo, hidrosulfatos y compuestos orgánicos volátiles para lo cual en un plazo máximo de 18 meses, 220 empresas que consumen el 53% del total de combustibles en el valle de México deberán contar con equipos anticontaminantes
- se integra un programa de capacitación de inspectores, auditores y verificadores, así como operadores de calderas y equipos de combustión.
- Se crea un cuerpo especial de inspección y asesoría profesional en la materia, y que actualmente las partículas de origen industrial son las de mayor riesgo para la salud, pues contienen químicos inorgánicos y metales pesados y constituyen el 65% de las partículas tóxicas suspendidas en el aire.

- se otorgara asesoria y equipo tecnologico a la industria para ue instale equipos anticontaminantes
- se desarrollaran politicas de energia ( ahorro, consumo racional, entre otras), ademas de que se controlaran y reformularan solventes de pinture
- Se cuenta con un billn de pesos para financiar el control de emisiones, cambiar procesos y descentralizar industrias,. Es importante se? alar que por primera vez en un programa de esta naturaleza intevienen siete bancos comerciales: Multibanco Mercantil d Mexico, Banca Serfin, Banca Confia, Bancomer, Banco Internacional, Multibanco Comermex y Banco BCH, asi como ocho arrendadoras.

Note. Need for sustained monitorin and implementation of regualtions regualtions cannot only be implemented as a means to an end. IMplementation of standards and regulations as a means to an end without the provisions in place to continue to impose, implement these regulation.. relax regulation

- SE continuaran actualizando y desarrollando nors cada vez mas estrictas para la industria, hasta alcanzar reducciones en la emision de paticulas entre un 70 y 90%

...Observaciones: El esfuerzo dl Gobierno en el combate a la contaminacion comprende acciones que abarcan a todos los sectores de la sociedad, las cuales han sido aplicadas con gran efectividad gracias al esfuerzo y al desarrollo de la conciencia ecologica del la poblacion con su conjunto.” ( documentation sent by Consulat of Mexico, latest news from April 12 and April 13 related to the environment)

“Whereas the Government of Canada in demonstrating national leadership should establish national environmental quality objectives, guidelines and codes of practice” ( Canadian Environmental protection act, 1988)

“Whereas toxic substances, once introduced into the environment, cannot always be contained within geographic boundaries ( Canadian Environmental protection act, 1988) section 2. a Government of Canada shall... take both preventative and remedial measures in protecting the environment” ( Canadian Environmental protection act, 1988)

In the Department of the Environment Act, under the division of "Powers, duties and functions of the Minister , it is stated that “the duties of the Minister include providing for

- a) the preservation and enhancement of the quality of the natural environment, including water, air and soil quality; and to

2(i) endeavour to protect the environment from the release of toxic substances". (Canadian Environmental Protection Act, 1988, C 22)

[ 'deleterious substance' means

a) any substance that, if added to any water would degrade or alter or form part of a process of degradation or alteration of the quality of that water so that it is rendered or is likely to be rendered deleterious to fish or fish habitat or to the use by man of fish that frequent that water"

(Fisheries act, statutes of Canada 1976077, c35)

yet raw sewage is still dumped into the waters around Vancouver Island and fish have lesions ]

" whereas... no present activity should compromise activities... fulfill the needs of future generations

Based on my discussions with President Salinas, I am convinced that he is firmly committed to strengthened environmental protection, and that there is strong support for this objective among the Mexican people. Because economic growth can and should be supported by enhanced environmental protection, we will develop and implement an expanded program of environmental cooperation in parallel with the free trade talks. ...thus, our efforts toward economic integration will be complemented by expanded programs of cooperation of labour and the environment." (Letter from George Bush to Chairman Rostenkowski and Majority Leader Gephardt; similar letter sent to every member of Congress, May 1, 1991)

Mexico's commitment to environmental protection

- Mexico has no interest in becoming a pollution haven for U.S. companies.
- Mexico's comprehensive environmental law of 1988, which is based on U.S. law and experience, is a solid foundation for tackling its environmental problems.
- All new investments are being held to these higher legal standards and an environmental impact assessment is required to show how they will comply.
- Enforcement has in the past been a key problem, but Mexico's record has been improving dramatically. Since 1989, Mexico has ordered more than 980 temporary and 82 permanent shutdowns of industrial facilities for environmental violations; the budget of SEDUE ( Mexico ' EPA) has increased almost eight-fold

Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991)

Direction to proceed is spelled out in McDorman analysis: need international agreement on priority for environmental objectives sufficiently strong that it formally and explicitly over-rides GATT where necessary.

Want to look closely at the US\_Mexico GATT panel report as outlined by McDorman

This shift in perspective must move away from perceiving that states have "the sovereign right to exploit their resources pursuant to their own environmental and developmental policies [and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other states or of areas beyond the limits of national jurisdiction." (Principle 2 in the Rio Declaration on Environment and Development)] . This shift in perspective must move away from perceiving that states have " the right to development [being fulfilled ] so as to equitable meet developmental and environmental needs of present and future generations" ( Principle 3 in the Rio Declaration on Environment and Development).

... few clauses from existing RIO declaration draft about prohibitions against use of environmental regulations as trade barriers, etc.

FIND

Let's recap briefly the steps already taken in the two major countries ( US story is perhaps well enough known anyway.)

to look at different sources of conflict associated with scarcity of exhaustible resources and struggles over shares of renewable resource in which everyone is racing to be first to harvest stocks in which no one is investing enough to assure any kind of sustainability of renewability

The advocating of a new found role of international governance for industry as a potential replacement for government.

Ramphal at Globe 92 described the new found role as " enlightened long-term thinking": He described the newly found enlightenment in the following way:

The private sector has been traditionally regarded as trammelled by short-term profit considerations. Enlightened long-term thinking was a preserve of the State, of governments. Today the greatest flaw in governance at the national level is the ascendancy of the short-term in the political calculus, as leaders respond frenetically to democratic pressures for immediate results. It is the private sector, and particularly the larger

enterprises within it, that have the intellectual space to think beyond tomorrow. ... ( Ramphal, S. 1992)

iv. The revealing of the true intent by industry in in-house documents.????  
from statements from industry about industry's perceived advantages of tripartite free trade.

McCrae, Jim World Bank Environmental division CHECK  
"dirty technology belongs in third world"  
Basle convention related to third world dumping

He reports that the panel found that "the obligations owed by the US to Mexico under GATT prohibited use of trade measures to deal with such environmental issues [ i.e. those having effect beyond the borders of the country adopting the trade measures]. This conclusion flows from the fact that GATT may regulate conditions around product, but not around means of production, and from the view that it is still possible to talk about the actions of a particular country affecting its environment. With these orientations, GATT can conclude that "Countries cannot look behind a good to determine if the production or manufacturing process was environmentally friendly. Or in other words countries cannot impose their environmental standards or regulations on other countries by boycotting their goods. "to a certain extent, this is what comparative advantage is all about: differences in their environment of production, including the environment of government regulations".

If this is true, how do we deal responsibly with environmental concerns in an emerging North American community in which sovereign communities still wish to pursue their own vision of interpersonal and inter-generational equity and sustainability?

( ) **THAT** in March 1992 I attended the Globe 1992, and I presented the draft Earth Charter at different sessions, and gave a copy to Noel Brown, the Secretary General of UNEP, to Arthur Campeau, the Canadian Ambassador to the UN, to the head European group, and to the head of the G77 group.

#### COMMENT

Talked to Noel Brown about Charter and was advised to pass it on to delegations in New York and to visit him in New York

( ) **THAT** in 1992, at Globe 21 I attended a session on ethics chaired by DOW chemical and intervened

( ) **THAT** in March 1992, I attended the Globe 1992 --the Environmental Clean-up Industry  
Environmentalists were invited to attend. They were always up at the microphone.

## COMMENT

it was obvious that globe 92 was an obfuscation of the environmental issue with very little call for doing it right the first time. the participants in the environment industry thrived on deregulation so that they could develop clean-up technologies.

Hugh Faulkner, whom I had gone out with in Ottawa, had become the executive director of the Business Council on Sustainable Development. he was on one of the panels. I spoke to him just before the session. when he was introduced as having worked at Alcan, he looked over at me and he could sense my disgust. i went up to the microphone, and used the opportunity to criticize the devastating logging practices in BC and the impact on the economy, export of raw laws, disregard for statutory law, and failure to implement effective value added. The moderator, ruled that my comments were out of order and did not have anything to do with the economy. Hugh Faulkner defended me, and then stated that the clear-cutting practices in British Columbia were not sustainable. He received questioning and disapproving glare from his cohorts.

( ) THAT in April,1992, I Conducted a workshop on the Delusion of Certainty in Science "Principle-based education. National Association of Research into Science Teaching (NARST) Conference in Boston, 1992

## COMMENT

I arrived a day early in Boston because I wanted to roam around Harvard University. I went to the Kennedy Centre, and I picked up a student newspaper and found out that there was a fascinating colloquium that day. Professors from MIT and from Harvard had written a controversial paper where they argued that Thomas Kuhn's concept of Paradigm shift based on the emergence of an anomaly was flawed and that the paradigm was so entrenched that the adherents could not recognize the anomaly until after the paradigm had shifted. It was obviously a colloquium of significance; emeritus professors came in on canes. there was the language of uncertainty and conditionality such as, if an electron were to behave would etc. I mentioned at one point that I was going to be attending the NARST conference where I was going to discuss the delusion of certainty in science, and I said I wish the discussion taking place now could be part of my presentation.

I went to the evening plenary of the NARST conference;a professor Rice who, in full patriarchal style with a beautiful assistant not unlike a tradition stage show was discussing the simplicity of science and models. I stood up and challenged him and said that he was offering nothing new but only reiterating what Herbert Simon from his University had advocated years ago. There was silence in the room of 5 hundred. I went to the washroom, and several women came up to me and thanked me for raising the issues that I raised. I also talked to one of the principal organizers who said that he had felt the same way about the key note address but of course he could not say anything.

( ) **THAT** in April 1992, at the Forest Caucus meeting of the BCEN, I worked on drafting resolutions based on the recommendations made during the caucus meeting. I was informed that the BCEN because it was a network

could not as an organization come out with resolutions. Presumably, the federal government would only fund the Environmental network if it remained a network and thus essentially a less effective organization.

## COMMENT

1992 BCEN attended the BCEN meeting in Victoria . Spent most of my time in the Forest Caucus compiling recommendations made by members. I proposed that we should come up with resolutions based of the recommendations coming from the members. It was agreed and a committee was set up. I spent the rest of the time working on the resolutions with his committee. On the final day of the Forest Caucus meeting I had the resolutions printed up and transferred to overheads in order to present them to the plenary of the Forest Caucus. No time was given to the resolutions. When there was the plenary session of the BCEN I went up to the microphone and started to read the resolutions. I was told that there could be no resolutions endorsed by the BCEN because it was a network and received funding on that basis. Subsequently at every BCEN meeting I raised the issue that the BCEN would be far more effective if they could issue resolutions.

## EXHIBIT:

### FOREST CAUCUS RESOLUTION:

1. Whereas, grass roots environmental groups and professional biologists believe present AAC levels are too high to sustain the ecological integrity of B.C.'s forest land, and the climate.

**Be it resolved that the government bring about the immediate reduction in AAC levels across the province of 46% (40 million M<sup>3</sup>)**

2. Whereas forests are [still] not being sustainably managed, and whereas the environment of a large portion of British Columbia has already been seriously degraded through past and current forest practices, and Whereas changes in AAC levels may affect forest employment,

**Be it resolved that the government implement a restoration project based on the principle of ecological sustainability with a view to creating local forest employment in every bio geoclimatic region.**

4. Whereas there are no comprehensive regulations of logging practices on privately owned unmanaged forest land and whereas currently there is over cutting occurring throughout the province on these lands with little regard to ecological considerations or follow-up silviculture.

Whereas raw logs are routinely exported from these private lands,  
**Be it resolved that the Forest Practices [Act] {be extended to cover these lands} and that the export of raw logs [can't and chips] from these lands cease immediately.**

5. Whereas GATT ruling is used to justified the continued export of raw logs

**Be it resolved that the government of British Columbia, urge the Federal Government to make a representation to GATT that the export of raw logs should not come under GATT**

6.&7 under revision

8 Whereas the results of audit of TFL 23 showed excessive site degradation to the ecosystem

Whereas there is considerable evidence that the forest companies have "caused serious damage to the natural environment

Whereas [representatives from] the Ministry of Forest admit that the Forest companies have caused serious damage to the natural environment

**Be it resolved that the government of British Columbia require the Ministry of Forest to invoke Section 60 of the Forest Act to suspend all licensees where there is evidence of serious damage to the natural environment**

Suspension by officer

60. The regional manager, a district manager or a forest officer authorized by either of them may, by written order and without notice, suspend in whole or part the rights under an agreement where he believes on reasonable and probable grounds that its holder has failed to perform an obligation to the performed by him under the agreement or has failed to comply with this Act or the regulations, and that the failure of performance or compliance is causing or may imminently cause serious damage to the natural environment

**Be it further resolved that section 28 of the Forest Act and section 2 of the PHSP be enforced**

8-10. Whereas the teaching of Forestry in British Columbia forces students to accept questionable scientific values regarding the ecological maintenance of our forests

**Be it resolved that an internationally based inquiry be made into the teaching of forestry in British Columbia and that subsequent action by government on the conclusions be taken.**

11 Whereas the environment must be given primacy, and whereas long term ecological rights must be given priority over short term economic privileges, and

**Be it resolved that [courts undertake to shift the onus of proof from the opponents of an intervention [in the ecosystem] having to demonstrate harm to the proponents of the intervention, having to demonstrate no long-term impacts on ecosystem.**

12. Whereas the Federal Ministry of Fisheries has sufficient evidence that damage to fish habitat has been caused though ecologically unsound logging and road building practices

**Be it resolved that Section 33 of the Fisheries Act be enforced by the Federal Government to prosecute companies that have through the deposit of deleterious substances caused deterioration of Fisheries.**

33.1 Every person who carries on or proposes to carry on any work or undertaking those results or is likely to result in the following:

a) the deposit of a deleterious substance in water frequented by fish or in any place under any conditions where that deleterious substance or any other

deleterious substance that results from the deposit of that deleterious substance may enter any such water, or  
b) the alteration, disruption or destruction of fish habitat,  
shall on the request of the Minister... (a) provide the Minister with such plans, specifications, studies, procedures, schedules, analyses, samples or other information relating to the work or undertaking and with such analyses, samples, evaluations, studies or other information relating to the water, place or fish habitat that is or is likely to be affected by the work or undertaking as will enable the Minister to determine  
c) whether there is or is likely to be a deposit of a deleterious substance by reason...d) whether the work or undertaking results or is likely to result in any alternation, disruption or destruction of fish habitat ...

13. Whereas there is currently a lack of meaningful participation by the public in all aspects of the planning process, [and  
whereas there continues to be an imbalance on consultative boards, of consumptive forest use]

**Be it resolved those provincial principles of preservation and ecologically sound practices be established, in line with high international standards and that community resource boards also be established to enable the public to have full participation in planning from the creation of the process, through the formulation of the terms of reference, through to the decision making and subsequent actions taken, to the follow up monitoring of the lands.**

**[Be it further resolved that on all consultative boards that there now be an imbalance in favor of non-consumptive use or a balance between consumptive and non-consumptive use]**

15. Whereas the Board of Directors of companies in the Forest Industry have had and continue to have the power to address the serious degradation of the environment through ecologically unsound practices

**Be it resolved that the Board of Directors be held responsible for past and current ecological devastation caused by destructive practices in forestry [through criminal law proceedings].**

**16** Whereas there is increasing scientific evidence that the water quality in logged community watersheds has deteriorated as the result of logging in water sheds?

**Be it resolved that logging cease immediately in all community watersheds, until studies have been conducted to determine the impact of logging and road building on water quality, [and until these studies can demonstrate that there will be no potential harmful effect on water quality]**

### **Recommendations for change in forest practices in B.C.**

1. Whereas, grass roots environmental groups and professional biologists believe present AAC levels are too high to sustain the ecological integrity of B.C.'s forest land, and the climate.

**Be it resolved that the government bring about the immediate reduction in AAC levels across the province of 46% (40 million M<sup>3</sup>)**

2. Whereas forests are [still] not being sustainably managed, and whereas the environment of a large portion of British Columbia has already been seriously degraded through past and current forest practices, and Whereas changes in AAC levels may affect forest employment,

**Be it resolved that the government implement a restoration project based on the principle of ecological sustainability with a view to creating local forest employment in every biogeoclimatic region.**

4. Whereas there are no comprehensive regulations of logging practices on privately owned unmanaged forest land, and whereas currently there is over cutting occurring throughout the province on these lands with little regard to ecological considerations or follow-up silviculture

( ) THAT in March 1992, I attended the PrepCom for UNCED

#### COMMENT

March 1992, I attended a meeting of accredited NGOs. Prior to this meeting I had attended a number of sessions on Climate Change where the state governments were seriously discussing the issue. At the meeting of NGOs the topic was not issues that should be addressed but who should be allowed to have accreditation. There appeared to be concern that too many NGOs during the UNCED process had been given accreditation and that UNCED should be deemed to be a special case and that the accreditation should not be extended beyond UNCED. I commented that perhaps I had come to the wrong meeting: The NGOS appeared to be more concerned with sustaining themselves than with dealing with vital issues. I walked out. Someone came out later on and told me that quite a discussion ensued after I left about the issue that I had raised.

Prep com UNCED March 1992 attended sessions on Indigenous issues. I was at a session where a Brazilian Indigenous man was speaking in Portuguese. It was a session in Spanish which I understand. He was such a powerful speaker that I felt I understood Portuguese . At the end of the meeting we all went over to the General Assembly where a meeting was in progress on indigenous issues. I decided to sit in the Canadian government section *which was empty*. The speaker, who had the floor, declared that he was furious with the Canadian delegate for refusing to add an "s" to indigenous people. I felt very uncomfortable given that I was the only one sitting in the Canadian delegation section. I was sure that if this discussion were to continue

that soon they would refer to the Canadian delegate as “he” and it would be obvious that they were not speaking about me. Another speaker got up and again criticized the Canadian delegate and at that time rather than mentioning “he” referred to the delegate as “she” I did not know what to do; what a dilemma; I could get up and change sections but I would appear to be guilty or I could stay and be deemed to be guilty. It was like trial by water . If I sank I would be innocent if I floated I would be guilty- rejected by God. The last speaker explained the significance of the [s] if there were no (s) then there would be only one indigenous delegation at the UN; with the (s), however, there would be several.

Suddenly a women stood up several rows in front, obviously not having the courage to sit in the Canadian section, and defended the Canadian position.

I decided to raise my hand and report that given that at this moment Mulroney is only at 20% of the polls, and that I was sure that the other 80 % would support adding the “s” and given that I was the only representative sitting in the Canadian section that I would like to propose that the “s” be placed on all documents with references to indigenous people. Before I could make my statement the meeting closed down. I went up to the moderator after and told him what I was going to say and that I would lobby in Canada to have the “s” back.

I slipped into the government discussion of the draft Earth Charter. When a Norwegian with an elegantly swirled green turban walked in. At one point the Chair asked if there were any NGOs in the room. I felt obliged to leave. I should have stated what my concerns were with the Earth Charter but instead I rose and indicated that I had several concerns and the chair responded that I could meet with him after. I left and went outside with my diagram and spoke to delegates about the exclusion of those delegates who did not speak English. I am able to speak French and Spanish and I raised the issue of the failure of the UN to accommodate in the working groups any official language other than English. I went back and spoke to the Chair about proposed changes to the Earth Charter. One of which was the Sovereign Right to exploit resources. After the meeting, I went to talk with the chair about several sections in the Earth Charter which I thought should be modified or changed.

In one of the evening sessions when they were working on the Earth Charter, the US proposed that principle 14 be removed because it was redundant. This principle was that states should prevent the transfer to other states of substances that are harmful to human health or the environment . The US claimed that this was the same as the trans-boundary principle. I believe it was Austria who stated that you are not fooling anyone. that seemed to stop the US and that principle is still in the document.

( ) **THAT** in March 31,1992 a document was issued about US playing God at the Summit, and I circulated this document widely

#### EXHIBIT

U.S Playing God at Earth Summit (March 31, 1992)

Early this week members of the US delegation were advised by a senior US delegation member that ten key issues must be kept off UNCED's agenda at all costs. During the meeting and since, these issues have been referred to within the delegation as the "ten Commandments."

the United States Government's "Ten Commandments" for UNCED are:

1. Thou shalt not ascribe to the precautionary principle
2. Thou shalt not share the benefits of technology.
- 3 Those shalt not allow financial resource formulas
4. Thou shalt oppose liability/compensation for environmental damage
5. Thou shalt avoid commitments of any kind.
6. Thou shall case aside environmental impact assessment concepts inconsistent with US law
7. Thou shalt frown upon new dispute resolution requirements
8. Thou shalt strike any reference to the military. (The military's name shall not be taken in vain).
9. Thou shalt block new institutions
- 10 Thou shalt not honour new UN pledges.

**( ) THAT** I circulated the Charter, the Declaration and a statement prior to leaving for Rio

#### EXHIBIT

The global environmental situation is so urgent approaching irreversibility that a new fundamental principle must underlie all development proposals. All proposed interventions in the ecosystem must have to be justified. The burden of proof must shift from opponents having to demonstrate harm to proponents having to demonstrate safety. We have come to this convention with the expectation that the global community recognizes that the global situation is urgent enough to move from global international rhetoric to global action.

Miami beach frozen in time. talked to Jules most of the night talked to Argentinian businessman- slept or about 15 minutes all night. No air conditioning on the plane from Paraguay - smoking prohibited feigned allergy

#### UNCED

Arrival in Rio

I stayed with Lucia Lopes whom I met at Uvic

Rio contradiction

Incredible mountains like meteora, in Greece, houses built up the side of mountain. Could have integrated building with incredible rock formation. Military presence.

Everywhere guns cocked ready for action. Lucia believes military to keep poor from interfering with delegates- beautiful apartment view from window of Christ on mountain and Panama; series of mountains and beaches; tunes  
THOUGHTOUT THE CONFERENCE THE WANTS OF THE NORTH WERE IN CONFLICT WITH THE NEEDS OF THE SOUTH; NOTHING EXPRESSES THIS CONFLICT MORE THAN THIS CARTOON BY GABLE

## COMMENT

When I arrived at UNCED, the first thing I did was to go to talk with an NGO official to ask if I could read the Nobel Laureate Declaration in the UN General Assembly. At this time, it was not possible. There were however, many opportunities to lobby state delegates, media and NGOs, And I printed up about 2000 Declarations and distributed them widely throughout the conference, including in the final plenary.

## COMMENT

Everyday there were briefings given by an organizing committee of NGOs. At one of the meetings, they were discussing developing a list of the worst government and institute performers. I suggested that we also add “the most preposterous proposal category, “and referred to the suggestion in the General Assembly by Hans Blik that nuclear energy was the solution to climate change.

( )**THAT** in 1992 at UNCED June 1992, UNCED, I participated, as media, in the opening press conference

## COMMENT

I attended the opening press conference where Maurice Strong and Gro Brundtland addressed the media. I waited until two male reporters had spoken and then I called out and asked her if she did not think that the continued enshrining of the Sovereign right to exploit resources would undermine any principles that would emerge from UNCED or weaken the resolve of UNCED. She replied that she would be going to be speaking on this issue in the next two weeks at Harvard. I then waited until the next session where Jacques Cousteau was speaking. He referred to many issues but did not mention anything about nuclear issue. I asked him what he thought of Hans Blix from the IAEA who had made the preposterous proposal that nuclear energy was the solution to climate change in the plenary of the General Assembly at UNCED. He responded that nuclear was no solution and that the north is phasing out nuclear and dumping it on the South. IAEA was in full force they were distributing thousands of brochures during the closing plenary as well Hans Blix had been given a platform at the General Assembly. When I saw the pamphlets being distributed, I copied hundreds of the Nobel Laureate Declaration. Note that there had been another Nobel Laureate declaration that was beginning to be circulated this declaration I believe.

( ) THAT I intervened at Jean Charest's press conference

Jean Charest was introduced as coming from a country that was extremely concerned about the environment and that Canada had produced a Green Book which should become the example of the world. I waited again until two men had spoken and then I called out that I thought that UNCED should be a time to dispel myths not to perpetuate them and that Canada was not a country that was concerned about the environment: Canada clearcuts forests, destroys biodiversity, dumps raw sewage into the ocean, allows nuclear powered and nuclear arms capable vessels to enter Canadian harbours etc. Also, Canada fails to discharge international obligations. I would like to stand up here and be proud of the Canadian record.

[I had intended to raise the issue of declaring old growth areas on Vancouver Island as World Heritage sites under the Convention on the Protection of Cultural and Natural heritage and that UNCED would be an excellent time to make this commitment.]

I spoke to Charest afterwards and said that I had to say what I said. I think that hypocrisy has to be exposed. If the government of Canada continues to give the impression to the global community that Canadians are concerned about being "stewards" of a "relatively unspoiled wilderness" (Canada report—Canada's submission to UNCED, 1992), then the citizens of Canada can legitimately expect that Canada will fulfill this obligation to be the steward of "relatively unspoiled wilderness" (doctrine of legitimate expectation): "If the government of Canada continues to give the impression to the global community that Canadians are concerned about being "stewards" of a "relatively unspoiled wilderness", then the citizens of Canada have the equitable right to expect that Canada will fulfill this expectation." (Doctrine of legitimate expectation)

Pauline Tangiora from Aotearoa, spoke after me and raised indigenous issues. A reporter from the Globe and Mail was furious because out of the five questions that were allowed at the press conference two of them were from NGOs. I responded that he could raise some of the issues that we raised. I was told afterwards that Louise Comeau, from the Sierra Club had assured Charest that she would discourage me from attending his press conferences.

( ) THAT IN 1992, I had heard that a US senator was going to be giving a press conference. I went to the international press room;

#### COMMENT

I knew his press conference would be crowded so I went into the preceding conference to wait for his conference; I waited but he did not arrive. When I left the press room, I saw a colleague who told me that she had been at the press conference given by the American senator at the NGO press room. I asked her to point out the senator who at that moment was walking towards us followed by the media. I wanted to interview him about the US insistence that any aid to the South had to be conditional aid. I wanted to point out that this request was hypocritical given that the US still has people sleeping on the streets and no universal health care. I went with my camera

up to the senator who was at that moment being interviewed by ABC. I asked his handler if I could ask a question and she said yes but only a short one. I interviewed him about the US insistence that any aid to the South had to be conditional I pointed out that this request was hypocritical given that the US still has people sleeping on the streets and no universal health care. While ABC was still there. He answered that if you are asking me if we could do better the answer is yes and then he left. I thought, "typical response of a senator". I didn't realize until two weeks later when I saw Gore on television that I had interviewed Gore and the "we" meant the Democrats.

( ) THAT in 1992, I intervened at Brian Mulroney's press conference'

#### COMMENT

Brian Mulroney had just signed the Convention on Biological Diversity and was surrounded by the international media and roses This was his moment! Canada had supposedly been the first to sign. Mulroney gave an almost Star-Wars statement We have dared to do what few could expect we have achieved never did we expect that so much could be accomplished [a paraphrase]. I borrowed a microphone from a French reporter and asked if this meant that he would condemn ecologically unsound practices that destroy biodiversity such as clear-cutting forests.

He stopped short and said, "I don't want to deal with any issues". Obviously, this was not the moment to discuss implementation. This was his moment of glory. Obviously surrounded by sympathetic media. He then glared at me and declared, "you know exactly what I mean."

I left then left for an Indigenous press conference.

( ) THAT IN 1992, I intervened at British PM press conference

At a press conference Prime Minister Major was asked what he was going to do about population. He responded in the usual white burden manner, about helping the South to achieve population control. I asked him if he did not think that perhaps he should allow the South to determine what would be the best approach

French premier raised the issue of nuclear energy

( ) THAT in 1992, I re-circulated the 10 commandments from the UNCED prep-com

#### EXHIBIT

10 COMMANDMENTS The Methodist got hold of a memo directed to EPA in it for example there were instructions not to agree to the precautionary principle, or any reference to military. THEY PREPARED A 10 COMMANDMENT DOCUMENT

March 21, 1992

US PLAYING GOD AT EARTH SUMMIT United Methodist a US NGO gave me a spoof on leaked US document about issues to be disqualified. The document was rephrased by NGOs to read as 10 commandments of negotiations.

Early this week members of the US delegation were advised by a senior US delegation member that ten key issues must be kept off UNCED's agenda at all costs. During the meeting and since; these issues have been referred to within the delegation as the ' ten Commandments."

The United States Governments' a "Ten Commandments" for UNCED are:

- 1 Thou shalt not ascribe to the precautionary principles
2. Thou shalt not share the benefits of technology
3. Thou shalt not allow financial resource formulas
4. Thou shalt oppose liability/compensation for environmental damage
5. Thou shalt avoid commitments of any kind
- 6 thou shalt cast aside environmental impact assessment concepts inconsistent with US law
7. Thou shalt frown upon new dispute resolution requirements
- 8 Thou shalt strike any references to th military. (the military's name shall not be taken in vain)
9. Thou shalt block new institutions
- 10 Thou shalt not honor new UN pledges.

-

( ) **THAT** in 1992 at Rio, I worked with a government delegate from Hungary on attempting to strengthen the Forest Principles document and place the document in the context of other obligations and commitments.

EXHIBIT

( ) **THAT** in 1992, at Rio, I placed the Forest Principles document in the context of previous international obligations and commitments to demonstrate the discrepancies between the Forest Principles and other environmental instruments.

**12 CAPITALS COMMENTS AND TITLES**

**TABLE OF CONTENTS:**

**1. THE NEED FOR HARMONIZATION WITH OTHER INTERNATIONAL DOCUMENTS P. 1**

**2. BACKGROUND DISCUSSION RELATED TO "DECLARATION OF FOREST PRINCIPLES P.5.**

**3. SECTION BY SECTION ANALYSIS P.5**

---

**1.THE NEED FOR HARMONIZATION OF THE "LAND RESOURCES: DEFORESTATION" DOCUMENT WITH RELEVANT SECTIONS IN AGENDA 21 (1992), IN THE RIO DECLARATION (1992), THE WORLD CHARTER OF NATURE (1982), AND THE PRESERVATION OF CULTURAL AND NATURAL HERITAGE (1972). TO HARMONIZE WITH AGENDA 21, THE "LAND RESOURCES; DEFORESTATION" DOCUMENT MUST ADDRESS THE FOLLOWING SECTIONS ADOPTED BY THE GLOBAL COMMUNITY THROUGH AGENDA 21, AND THE RIO DECLARATION:**

- THREAT OF UNCONTROLLED DEGRADATION
- THREAT OF CONVERSION TO OTHER TYPES OF USE
- HARMFUL MISMANAGEMENT SUCH AS UNSUSTAINABLE COMMERCIAL LOGGING

"Forests world-wide have been and are being threatened by uncontrolled degradation and conversion to other types of land uses; influenced by increasing human needs; agricultural; expansion, and environmentally harmful mismanagement, including, for example, lack of adequate forest-fire control and anti-poaching measures, unsustainable commercial logging, overgrazing and ... the impacts of loss and degradation of forests are in the form of soil erosion; loss of biological diversity, damage to wildlife habitats and

degradation of watershed areas, deterioration of the quality of life and reduction of the options for development. (Agenda 21, 11.12. Deforestation)

- ECOLOGICAL DETERIORATION OF WATERSHEDS
- EXCESSIVE DEFORESTATION

"There are serious problems of ecological deterioration in these watershed areas. ... In many areas this is accompanied by excessive livestock grazing, deforestation and loss of biomass cover. (Agenda 21 -13.13 Fragile ecosystems)

- INAPPROPRIATE AND UNCONTROLLED LAND USE

" Inappropriate and uncontrolled land uses are a major cause of degradation and depletion of land resources. Present land use often disregards the actual potentials, carrying capacities and limitations of land resources as well as their diversity in space. (Agenda 21 - 14.34 Agriculture)

- LOSS OF BIODIVERSITY FROM OVER-HARVESTING
- LOSS OF BIODIVERSITY FROM HABITAT DESTRUCTION
- LOSS OF BIODIVERSITY FROM POLLUTION

" Despite mounting efforts over the past 20 years, the loss of the world biological diversity, mainly from habitat destruction, over-harvesting, pollution and the inappropriate introduction of foreign plants and animals has continued." (Agenda 21, 15.3 Biodiversity)

- WATER QUALITY AFFECTED BY DEFORESTATION
- WATER QUALITY AFFECTED BY LOSS AND DESTRUCTION OF CATCHMENT AREAS
- LAND DEGRADATION FROM DEFORESTATION
- PROBLEMS ARISE BECAUSE OF DEVELOPMENT MODEL IS ENVIRONMENTALLY DESTRUCTIVE
- INADEQUATE MONITORING
- NEED FOR PREVENTIVE APPROACH

"Major problems affecting the water quality of rivers and lakes arise, in variable order of importance according to different situations, from inadequately treated domestic sewage, inadequate controls on the discharges of industrial waste waters, loss and destruction of catchment areas, ill-considered siting of agricultural practices. This gives rise to the leaching of nutrients and pesticides. Aquatic ecosystems are disturbed and living freshwater resources are threatened. ...Erosion, degradation, deforestation and desertification have led to increased land degradation, and the creation of reservoirs have, in some cases, resulted in adverse effects on ecosystems. Many of these problems have arisen from a development model that is environmentally destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management, use and treatment of water resources and aquatic ecosystems. A preventive approach, where appropriate, is crucial to

the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies. (Agenda 21, 18.45 Fresh water)

- CONSERVATION OF BIODIVERSITY

" Promote cooperation between the parties to relevant international conventions and action plans with the aim of strengthening and coordinating efforts to conserve biological diversity and the sustainable use of biological resources. (Agenda 21, 15.8 e. biodiversity)

" Strengthen support for international and regional instruments, programmes and action plans concerned with the conservation of biological diversity and the sustainable use of biological resources. (15.8 f, Biodiversity)

- NEED TO REORIENT EXISTING PRODUCTION AND CONSUMPTION PATTERNS

"Achieving the goals of environmental quality and sustainable development will require efficiency in production and changes in consumption patterns in order to emphasize optimization of *resource use* and minimization of waste. In many instances, this will require reorientation of existing production and consumption patterns that have developed in industrial societies and are in turn emulated in much of the world. (4.15 Changing Consumption Patterns, Agenda 21).

- PROMOTION OF PATTERNS OF CONSUMPTION TO MEET BASIC NEEDS

" To promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity (4.7.a Changing Consumption Patterns, Agenda 21)

- PRECAUTIONARY PRINCIPLE

" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).

- PROVISION FOR NOMINATION OF WORLD HERITAGE SITES FOR OLD GROWTH

" Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic *resources*, involving in situ and ex situ measures and undertaking supportive measures to ensure sustainable utilization of biological resources and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities; (11.15 b., Deforestation, Agenda 21)

- VALUE OF FORESTS THROUGH NON-DAMAGING USES

It is also possible to increase the value of forests through non-damaging uses such as eco-tourism and the *managed supply* of genetic materials.

Concerted action is needed in order to increase people's perception of the value of forests and of the benefits they provide. (11.22. Deforestation, Agenda 21)

- **VALUE OF ECOTOURISM**

"To promote more comprehensive use and economic contribution of forest areas by incorporating eco-tourism into forest management and planning. (11.23 d Deforestation, Agenda 21)

- **SUPPORT OF ARMS-LENGTH RESEARCH**

Governments and institutions, in collaboration where necessary with appropriate international agencies and organizations, Universities and non-governmental organizations should undertake assessments and systematic observations of forests and related programmes and processes with a view to their continuous improvement. (11.34 Deforestation)

the promotion of sustainable production systems such as traditional methods of agriculture, agroforestry, forestry, range and wildlife *management*, which use, maintain or increase biodiversity (15.5 Biodiversity, Agenda 21)

- **PROMOTION OF TRADITIONAL METHODS OF FORESTRY THAT MAINTAIN OR INCREASE BIODIVERSITY**

" Take effective economic, social and other appropriate incentive measures to encourage the conservation of biological diversity and the sustainable use of biological *resources*, including the promotion of sustainable production systems, such as traditional methods of agriculture, agroforestry, forestry, range and wildlife *management*, which use, maintain or increase biodiversity (15.5 d Biodiversity, Agenda 21)

- **LIMITATION OF THE SOVEREIGN RIGHT TO EXPLOIT**

States have the sovereign right to exploit their own biological *resources* pursuant to their environmental policies, as well as the responsibility to conserve their biodiversity and use their biological resources sustainably, (15.3 Biodiversity, Agenda 21)

- **PRESERVATION OF 12% REPRESENTATIVE ECOSYSTEM**

- **ENVIRONMENTAL ASSESSMENT OF ALL ACTIVITIES THAT COULD HAVE SIGNIFICANT IMPACTS (INCLUDE FOREST ACTIVITIES)**

Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42 Settlement, Agenda 21)

- **NEED TO DISCOURAGE OR PREVENT TRANSFER OF ACTIVITIES AND SUBSTANCES THAT CAUSE ENVIRONMENTAL DEGRADATION**

"States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health."(Principle 14 Rio Declaration)

## 2. BACKGROUND DISCUSSION RELATED TO A "DECLARATION OF FOREST PRINCIPLES"

**Agenda 21, which was adopted by the global community, was all-inclusive of its examination of "sustainable development," the "Land Resources - Deforestation" document, however, is a narrow sectoral document. Principles related to the inherent worth of forest ecosystem, the sustainability of forest use, and the necessity of international ecologically sound standards must reflect the complexity and all-inclusiveness of many of the enunciated principles in Agenda 21, the Rio declaration as well as the fundamental ecologically sound approach to forests.**

**Given that " We have come to realize that threats to the biosphere, which sustains all life on earth, have changed in rate, magnitude and scale, to such an extent that inaction would be negligent. (Alternate Earth Charter, Global Forum, 1992), we propose the following:**

**Rather than a "Land resources: Deforestation" document which deals with forests in a narrow sectoral way, a comprehensive "Declaration of Forest Principles" is proposed. The following declaration is based on the "unofficial Land Resources: Deforestation", text from June 16, 1992). The complete text is printed here in 10 point plain. This text, however, has been expanded and altered: sections that are recommended for deletion are in *10-point italics*. Sections drawn from various sections of Agenda 21 (1992), the Rio Declaration (1992), World Charter of Nature (1982) and Preservation of Cultural and Natural Heritage (1972) are in 10 point plain underlined. Recommendations made by environmental groups are in **10 bold** drawn from various recommendations, and comments and titles are in **12-point CAPITALS****

### 3. SECTION BY SECTION ANALYSIS OF "LAND RESOURCES: DEFORESTATION" DOCUMENT WITH SUGGESTED DELETIONS AND ALTERATIONS IN ORDER TO ACHIEVE A PROPOSED "DECLARATION OF FOREST PRINCIPLES" DOCUMENT COPY OF TEXT WITH ADDITIONS FROM ENVIRONMENTAL GROUPS AND FROM AGENDA 21 AND THE RIO DECLARATION.

#### LAND RESOURCES: DEFORESTATION

Non-legally binding [legally binding] authoritative statement of principles for a global consensus on the *management* conservation and sustainable development of all types of forests.

#### PREAMBLE

(a) The subject of forests is related to the entire range of environmental and development issues and opportunities including **the right to conservation of representative ecosystems, right to non-consumptive enjoyment of**

**forests and the right to ecologically sound employment** *the right to socio-economic development on a sustainable basis.*

b) The guiding objective of these principles is to contribute to the **conservation of forest ecosystems, and to the establishment of ecologically sound forest practices** *of the management, conservation and sustainable development of forests, and to provide for the setting aside of wilderness, for the preservation of significant unfragmented old growth systems, and for the establishment of international ecologically sound standards of true sustainability.* *their multiple and complementary function and uses.*

c) Forestry issues and opportunities should be examined in an holistic and balanced manner within the overall context of environment and development, taking into consideration **the mandate to set aside untouched wilderness areas, to preserve significant unfragmented old-growth forest ecosystems, as well as the non-consumptive and ecologically sound uses** *multiple functions and uses of forests, including traditional uses, and the likely economic and social stress when these uses are constrained or restricted, as well as the potential for development that sustainable forest management can offer.* It is also possible to increase the value of forests through non-damaging uses such as eco-tourism and the managed supply of genetic materials. Concerted action is needed in order to increase people's perception of the value of forests and of the benefits they provide. (11.22. Deforestation)

d) These principles reflect a first global consensus on forests. In committing themselves to the prompt implementation of these principles, countries also decide to keep them under assessment for their adequacy with regard to further international cooperation on forest issues **and for the establishment of international enforceable ecologically sound standards. These standards must give primacy to the understanding of the forest as a complex interacting ecosystem, including the "cradle to grave approach" assessment of all intrusions into the ecosystem.** Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits (20.20 e Hazardous wastes)

e) These principles should apply to all types of forests, both natural and planted, in all geographic regions and climatic zones, including austral, boreal, sub-temperate, temperate, sub-tropical and tropical.

f) All types of forests embody complex and unique ecological processes **which are of intrinsic value in themselves (World Charter of Nature)** and which are the basis for their present and potential capacity to provide resources to satisfy human needs as well as environmental values and as such **their ecologically sound use** *sound management* and **their** conservation is of concern to the Governments of the countries to which they belong **[ and to the world community]** and are of value to local communities and to the environment as a whole.

g) *Forests are essential to economic development and the maintenance of all forms of life.* **have intrinsic value and are essential to all forms of life**

h) **Even though** *Recognizing that the responsibility for forest management, conservation and sustainable development is in many States allocated among federal/national, state/provincial and local levels of government, each State, in accordance with its constitution and/or national legislation should pursue **international ecologically-sound standards** these principles at the appropriate level of government*

Principles/elements

1. a) *States have, in accordance with the Charter of the United Nations and the principles of international law, the sovereign right to exploit their own resources pursuant to their own environmental policies and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other States or of areas beyond the limits of national jurisdiction and States have the sovereign right to exploit their own biological resources pursuant to their environmental policies, as well as the responsibility to conserve their biodiversity and use their biological resources sustainably, (15.3 Biodiversity, Agenda 21) and the responsibility to ensure that activities within their jurisdiction do not cause damage to the environment both within and beyond their own state, and providing that they do not violate internationally ecologically sound standards, and the responsibility to recognize the inherent worth of the forest ecosystem itself ( World Charter of Nature), to promote the setting aside of undisturbed wilderness, and to allow the forest ecosystem to renew itself*

(b) **Recognizing the importance of preservation of forest ecosystem and the setting aside of undisturbed wilderness**, the agreed full incremental cost of achieving benefits associated with forest conservation and sustainable development requires increased international cooperation and should be equitably shared by the international community. **Due consideration should be given to the designating of an increased number of unfragmented forest ecosystems under the UN Convention for the Preservation of Cultural and Natural Heritage.**

2. (a) *States have the sovereign and inalienable right as well as the responsibility to conserve their biodiversity and use their biological resources sustainably, (15.3 Biodiversity) and the responsibility to ensure that activities within their jurisdiction do not cause damage to the environment both within and beyond their own state, and providing that they do not violate internationally ecologically sound standards , to utilize, manage and develop their forests in accordance with their development needs and level of socio-economic development and on the basis of national policies consistent with sustainable development and legislation, including the conversion of such areas for other uses within the overall socio-economic development plan based on rational land-use policies." Inappropriate and uncontrolled land uses are a major cause of degradation and depletion of land resources. Present land use often disregards the actual potentials, carrying capacities and limitations of land resources as well as their diversity in space. (14.34 Agriculture).*

**Recognizing that since the term 'management' implies that we are in fact capable of truly managing forests in a sustainable way, and since we must recognize that the forest ecosystem is complex and indeterminate, and that many of our intrusions have unexpected consequences, that we should proceed with caution by observing and drawing upon the expertise evidenced in the few existing unfragmented original growth ecosystems.**

**(b) The precautionary principle is followed in all proposed logging activity because of the potential for logging activity to cause 'serious and irreversible' damage. *Forest resources and forest lands should be preserved for their inherent value (World Charter of Nature) so as to leave open a full range of non-consumptive options.***

**Other Forests should be used as resources providing that ecologically sound practices are used for harvesting and restoring the forest resources should sustainably managed to meet the social, economic, ecological, cultural and spiritual human needs of present and future generations. *These needs are for forest products and services, such as wood and wood products, water, food, fodder, medicine, fuel, shelter, employment, recreation, habitats for wildlife, landscape diversity, carbon sinks and reservoirs, and for other forest products.* Appropriate measures should be taken to protect forests against harmful effects of pollution, including air-borne pollution, fires, pests and diseases, **and from harmful logging practices and from harmful chemicals that are used for forest "management" in order to maintain their full multiple value. to leave open options for non-consumptive use.****

**(c) The provision of timely, arms-length reliable and accurate information on forests and forest ecosystems is essential for public understanding and informed decision-making and should be ensured.**

**(d) Governments should promote and provide opportunities for the participation in the establishing of terms of reference and throughout the decision-making process of interested parties, including local communities and indigenous people, industries, labour, non-governmental organizations and individuals, forest dwellers and women, in the development, implementation and planning of national forest policies. taking fully into consideration adherence to international ecologically sound standards. A distinction should be made between input from vested short-term economic interest for economic gain and long-term concern about the ecological commons.**

- 2. (a) International ecological standards shall provide a framework for development and strengthening of conservation and sustainable development. National policies and strategies should provide a framework for increased efforts, including the development and strengthening of institutions and programmes for the *management, conservation and sustainable development of forests and forest lands.***
- 3. Implementation of international ecologically sound standards.**

**These standards shall apply to all forests on public and private lands, and should draw upon ecologically sound indigenous and traditional practice that have been demonstrated to preserve biodiversity.**

b) International institutional arrangements, building on those organizations and mechanisms already in existence, as appropriate, should facilitate international cooperation in the field of forests.

c) All aspects of environmental protection and social and economic development as they relate to forests and forest lands should be integrated and comprehensive.

4. the vital role of all types of forests in maintaining the ecological processes and balance at the local, national, regional and global levels through, inter alia, their role in protecting fragile ecosystems, watersheds and freshwater *resources sources* and as rich storehouses of biodiversity ... **and International ecological sound guidelines shall be in place to ensure this vital role.**

*-and the vital role of biological resources and sources of genetic material for biotechnology products, as well as photosynthesis, should be recognized, and international standards shall be in place as guidelines to ensure this vital role.*

5 (a) **Developed states and companies shall be responsible in their own country and in their country of operation for restoring the land that had previously been destroyed through ecologically unsound logging practices and through ecologically unsound silviculture practices. In developing countries, international assistance shall be given to restore land destroyed through subsistence forestry.** National forest policies should recognize and duly support the identity, culture and the rights of indigenous people, their communities and other communities, and forest dwellers. Appropriate conditions should be promoted for these groups for them **to have a representative ecosystem preserved, access to independent arms-length research, as well as** an economic stake in forest use, perform economic activities, and achieve and maintain cultural identity and social organization, as well as adequate levels of livelihood and well-being, through, inter alia, those land tenure arrangements which serve as incentives for **the sustainability** *the sustainable management* of forests. **A distinction should be made between "forest dwellers" and forest exploiters (those who go into the forest primarily to exploit the forest as a resource). The practice of destroying forest lands for the growing of cash crops for external markets as part of the current model of development should be halted.**

b) The full participation of women in all aspects of *management, conservation* and sustainable development of forests should be actively promoted.

6. (a) All types of forests play an important role in meeting energy requirements through the provision of a renewable source of bio-energy;

particularly in developing countries, and the demands for fuel wood for household and industrial needs should be met through sustainable forestry *management*, afforestation and reforestation. *To this end, the potential contribution of plantations of both indigenous and introduced species care should be taken to resist the introducing of off-site planting for the provision of both fuel and industrial wood should be recognized.* **" Despite mounting efforts over the past 20 years, the loss of the world biological diversity, mainly from habitat destruction, over-harvesting, pollution and the inappropriate introduction of foreign plants and animals has continued. (15.3 Biodiversity, Agenda 21)**

b) National policies and programmes **in accordance with international ecologically sound standards** should take into account the relationship, where it exists, between the conservation, *management and* sustainable development of forests and all aspects related to the production, consumption, recycling and/or final disposal of forest products, **and that international trade agreement shall not require states to relax high environmental standards.**

(c) Decisions taken on the *management*, conservation and sustainable development of *forest resources* **forests should** benefit to the extent practicable from a comprehensive assessment of economic and non-economic values of forest goods and services and of the environmental costs and benefits. The development and improvement of methodologies for such evaluations should be promoted.

d) The role of planted forests and permanent agricultural crops as sustainable and environmentally sound sources of renewable energy and industrial raw material should be recognized, enhanced and promoted. The contribution to the maintenance of ecological processes, to offsetting pressure on primary/old-growth forest and to providing regional employment and development with the adequate involvement of local inhabitants should be recognized and enhanced.

(e) Natural forests also constitute a source of goods and services and their conservation; sustainable *management* development and use should be promoted.

7.(a) Efforts should be made to promote a supportive international economic climate conducive to sustained and environmentally sound development of forests in all countries, which include, inter alia, the promotion of sustainable patterns of production and consumption, the eradication of poverty, and the promotion of food security.

8.(a) Efforts should be undertaken towards the greening of the world. All countries, notably developed countries **in accordance with international ecologically-sound standards**, should take positive and transparent action towards reforestation, afforestation and forest conservation, as appropriate.

(b) Efforts to maintain and increase forest cover and forest productivity should be undertaken in ecologically, economically and socially sound ways through the rehabilitation, reforestation and re-establishment of trees and forests on unproductive, degraded and deforested lands, as well as through **allowing**

**previously destroyed forests to regenerate themselves** *the management of existing forest resources.*

(c) The implementation of national policies and programmes aimed at forest *management*, conservation and sustainable development, particularly in developing countries, should be supported by international financial and technical cooperation, **in accordance with International ecologically sound standards**, including through the private sector, where *appropriate*, **and should not violate principle 14 of the Rio Declaration., or the principles in the Biodiversity Convention.**

(d) Sustainable forest *management and use* should be carried out in accordance with national development policies **that do not violate international conventions such as Biodiversity as well as international ecologically-sound standards**, *and priorities and on the basis of environmentally sound national guidelines. In the formulation of such guidelines account should be taken, as appropriate, and if applicable, of relevant internationally agreed methodologies and criteria.*

(e) Forest *management conservation and use* should be integrated with *management of adjacent areas* so as to maintain ecological balance and sustainability *sustainable productivity.*

(f) National policies and/or legislation aimed *at management*, conservation and sustainable development of forests, should include the protection of ecologically viable representative or unique examples of forests, including primary/old-growth forests, cultural, spiritual, historical, religious and other unique valued forests of national importance; **these forests should be distributed widely throughout each state and throughout the world.**

(g) Access, **shall be required to comply with international ecologically sound standards**, to biological resources - including genetic material, shall be with due regard to the sovereign rights of the countries where the forests are located and to the sharing on mutually agreed terms of technology and profits from biotechnology products that are derived from these resources.

(h) National policies should ensure that environmental impact assessments should be carried out where actions are likely to have significant adverse impacts on important forest resources, and where such actions are subject to a decision of a competent national authority. **Conversely it must also be recognized that forest practices have and continue to have significant adverse impacts on the land and water base, and that the impact of forest practices must also be under the purview of environmental impact assessment. To determine the environmental impact, states shall apply international ecologically sound standards, established by an independent, arms-length research body, and**

Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42 Settlement, Agenda 21)

9 (a) The efforts of developing countries, to strengthen the *management*, conservation and sustainable development of their forests *resources* should be supported by the international community taking into account the importance of redressing external indebtedness, particularly where aggravated by the net transfer of resources to developed countries, as well as

the problem of achieving at least the replacement value of forests through improved market access for forest products, especially processed products. In this respect, special attention should also be given to countries undergoing the process of transition to market economies. **No state shall be required to log a forest to service international debt or to comply with international trade regulations. Debt remission for preservation of significant forest areas should be instituted.** "States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health."(Principle 14, Rio Declaration)

(b) The problems that hinder efforts to attain the conservation and sustainable use of forests *resources and* stem from the lack of alternative options available to local communities, in particular the urban poor and poor rural populations who are economically and socially dependent on forests *and forest resources*, should be addressed by Governments and the international community.

(c) National policy formulation with respect to all types of forests **shall give primacy to the fulfillment of high international ecological standards and not compromise those long-term ecological principles for the sake of short-term economic gain, but rather attempt to convert ecologically unsound practices to ecologically sound practices.** *should take account of the pressures and demands imposed on forest ecosystems and resources from influencing factors outside the forest sector and inter-sectoral means of dealing with those pressures and demands should be sought.*

11. New and additional financial resources should be provided to developing countries to enable them to sustainably *manage*, conserve and develop their forests *forest resources*, including afforestation, reforestation and combating deforestation, forest and land degradation **through the use of ecologically sound practices and substances such as selective logging, safe alternative pest control method.**

12. In order to enable in particular developing countries to enhance their endogenous capacity and to better *manage*, conserve and develop their **forests forest resources**, the access to and transfer of environmentally sound technologies and corresponding know-how on favourable terms, including on concessional and preferential terms, as mutually agreed, in accordance with the relevant provisions of Agenda 21, should be promoted, facilitated, and financed, as appropriate, **and in accordance with principle 14 ( anti-dumping principle) of the Rio Declaration, and in accordance with the precautionary principle.**

13 (a) Scientific **arms-length** research, forest inventories and assessment, carried out by national institutions, **in accordance with international ecologically-sound standards**, which take into account, where relevant, **wilderness**, biological, physical, social and economic variables, as well as the technological development and its application in the field of *sustainable forest management*, conservation and development, should be strengthened through effective modalities, including international cooperation. In this context, attention should also be given to research and development of

sustainably harvested non-wood products. (WHAT WOULD THIS INCLUDE? HUNTING, MEDICINES)

(b) National and where appropriate, regional and international institutional capabilities in, education, training, science, technology, economics, anthropology and social aspects of forests, **wilderness** and forest sustainability management *are* essential to the conservation and sustainable development of forests and should be strengthened.

(c) International exchange of information **on the results of the intrinsic worth of forest ecosystems, on significance of wilderness and on ecologically sound forest practices** *forest and forest management* research and development should be enhanced and broadened, as appropriate, making full use of education and training institutions, including those in the private sector. **The international community shall set up an independent body to determine the accuracy of the claims made by multinational forest companies, and to establish a set of international standards of ecologically sound forest practices.**

(d) Appropriate indigenous capacity and local knowledge regarding the conservation and sustainable development of forests should, through institutional financial support and in collaboration with the people in local communities concerned, be recognized, respected, recorded, developed and, as appropriate, introduced in the implementation of programmes, **and their input sought in the establishment of international standards of ecologically sound forest practices.** Benefits arising from the utilization of indigenous knowledge should therefore be equitably shared with such people.

14. (a) **Given the urgency of deforestation and soil degradation that was recognized by the global community in Agenda 21, fundamental environmentally sound principles must be given primacy in any trade negotiations.** *the Trade in forest products should be based on non-discriminatory and multilaterally agreed rules and procedures consistent with international trade law and practices. In this context, open and free international trade in forest products should be facilitated.*

(b) *reduction or removal of tariff barriers and impediments to the provision of market access and better prices for higher value-added forest products and their local processing should be encouraged to enable producer countries to better conserve and manage , sustain and allow for the renewal of their forests their renewable forest resources,* and the export of resources, such as raw logs, cants and wood chips, that detract from value-added forest production, must be discontinued.

(c) **Since true environmental costs, assessed by an independent environmental audit, have been ignored in the process of decision making about forest use, environment costs and benefits must be assessed.** Incorporation of environmental costs and benefits into market forces and mechanisms. In order to achieve forest conservation and sustainable development, should be encouraged both domestically and internationally, and

(d) **Forest conservation and sustainable development policies shall be given primacy and should not be compromised by economic policies** *should be integrated with economic, trade and other relevant policies.*

(e) Fiscal, trade, industrial, transportation, and other policies and practices that may lead to forest degradation should [**shall**] be avoided. Adequate policies, aimed at *management*, conservation and sustainable development of Sforests, including *where appropriate incentives for the conversion from ecologically unsound practices* should be encouraged.

*15(a) Unilateral measures, obligations or agreements, to restrict and /or ban international trade in timber of other forest products should be removed or avoided, in order to attain long-term sustainable forest management*

16. Pollutants, particularly air borne pollutants, including those responsible for acidic deposition, **that** are harmful to the health of forest ecosystems at the local, national regional and global levels should be controlled, **and the use of harmful pesticides in forestry should be reduced and eventually eliminated.**

Governments, in cooperation with relevant international organizations and programmes, should carry out national reviews, as appropriate, of previously accepted pesticides whose acceptance was based on criteria now recognized as insufficient or outdated and of their possible replacement with other pest control methods, particularly in the case of pesticides that are toxic, persistent and/or bio-accumulative. (19.55 b Toxic chemicals))

" Integrated pest *management*, which combines biological control, host plant resistance and appropriate far practices and minimizes the use of pesticides, is the best option of the future as it guarantees yields, reduces costs, is environmentally friendly and contributes to the sustainability of agriculture. (14.74 Agriculture)

"Promoting the use of environmentally less harmful pesticides and fertilizers and alternative methods for pest control, and considering the prohibition of those found to be environmentally unsound (17.28 i)

( ) **THAT** I wrote a position piece on Canada's ignoring international obligations for the Times Colonists

## **EXHIBIT**

### **1992 CANADA IGNORES INTERNATIONAL ENVIRONMENTAL DOCUMENTS**

Canada violates or ignores international environmental documents to which it has been a signatory while deluding the world community into thinking that it is genuinely concerned about the environment.

At the press conference given by Federal Minister of the Environment, Jean Charest at the UNCED conference in Rio, a representative of the United Nations introduced Charest as being from a country which was truly concerned about the environment. During the question period I indicated that " UNCED should be a time to dispel myths not perpetuate them and that

Canada is not an ecologically sound country and that we should be honest with the rest of the world

Evidence that could dispel the myth that Canada is truly concerned about the environment has been occurring for years throughout B.C. in the forest industry, and is occurring currently in the dispute in Clayoquot Sound.

Rather than the courts in Canada insisting on adherence to international environmental documents such as the World Charter of Nature (UN Resolution 37/7, 1982) or to the current Convention on Biological Diversity (1992), Canadian courts condemn those who strive to call for the adherence to international law (environmentalists), and condone those who ignore International Law. (industry).

For Example, Canada is a signatory of the World Charter of Nature, 1982 (UN resolution 37/7) which states the following:

11. Activities which might have an impact on nature shall be controlled, and the best available technologies that minimize significant risks to nature or other adverse effects shall be used; in particular;
  - a) all activities which are likely to cause irreversible damage to nature shall be avoided;
  - c) Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed;

Have governments in Canada since 1982 "avoided" industrial activities such as ecologically unsound "logging practices" that have caused irreversible damage to nature.? Have governments in Canada called upon forest companies to not proceed with ecologically unsound practices whose adverse effects are not fully understood?

In 1992, Canada is now a signatory of the Convention on Biological Diversity which notes the following:

that it is vital to anticipate, prevent and attack the causes of significant reduction or loss of biological diversity at source.

also, where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat

Is Canada reducing the loss of biological diversity at the source, when it is prepared to log old growth forests before it has carried out adequate non-arm's length research into the true biodiversity of the old growth forests? Is there not strong enough evidence in place that clear-cut logging has

destroyed biodiversity, yet we appear to wait for "scientific certainty" before we are prepared to avoid or minimize such a threat? By that time there may be very little biodiversity left.

At the Press Conference where Mulroney signed the Convention on Biological Diversity in Rio de Janeiro, I asked him " if the signing of this document would mean that the government of Canada would condemn ecologically unsound practices such as clear-cut logging that destroy biodiversity." He replied, "he did not want to deal with issues."

If Mulroney is willing to sign a document professing to adhere to the preservation of biodiversity, and if he is not willing to deal with the practices that contribute to the loss of biodiversity, then the Canadian public will have to bring this discrepancy between rhetoric and action to the attention of the international community..

The environmentalists who have continually been striving to preserve the little remaining old growth forests, and to call for the need to identify and do research into biodiversity are the ones who have been adhering to the principles enunciated in the United Nations' World Charter of Nature. They will also be the ones who are calling for the preservation of the old growth areas so that Canada will be able to adhere to the binding principles enunciated in the United Nations Convention on Biological Diversity. Yet it is those who act to prevent "irreversibility" that are prosecuted as criminals, and those who cause 'irreversibility" that are protected by Canadian courts.

( ) THAT, 1992, I wrote an affidavit for the court case to prevent Nuclear powered and nuclear arms capable vessels in greater Victoria Harbour I have analyzed statements in the following Government of Canada statutes and attempted to extract and categorize general principles underlying these statements:

The Atomic Energy Control Act, R.S. C A-19, S 1  
The Emergency Preparedness Act, 1988, C 11.  
The Canadian Environmental Protection Act, 1988, C 22.  
The Environmental Contaminants Act, 1974-75-76, C 72.  
The Fisheries Act, 1977, C 35  
The Department of the Environment Act, R.S., C 14 (2nd Supp.), s2  
The Government Organization Act 1979, C 13  
The Hazardous Products Act, R.S., C H-3, S 1

In all the statutes, which I examined, dealing with either hazardous materials or the pollution caused by hazardous materials, importance is placed on the determination of the safety of the hazardous materials. And it is recognized that in order to determine safety, it is necessary to have information about the materials and their uses. This principle is enunciated in the following examples drawn from the statutes.

a) In section 11 (Disclosure) of the Hazardous Products Act, "disclosure of information is required where the Minister has reason to

believe that a product or substance may be dangerous... The Minister may send a written notice to the manufacturer of the product or substance requesting the manufacturer to disclose to the Minister the formula, composition or chemical ingredients of the product or substance and such other information in the possession of the manufacturer as the Minister deems necessary for the purpose of determining whether the product or substance is or is likely to be a danger to the health or safety of the public.”(The Hazardous Products Act. R.S., CH-3, S 1)

b) Pursuant to 7 (2) Of the Environment Contaminants Act “where the Minister of National Health and Welfare believes that a substance will constitute a significant danger to human health or the environment, the Minister may send a written notice to any person engaged in any commercial, manufacturing or processing activity involving the substance or any member of a classes of substances of which the substance is a member requiring that person to furnish the Minister with such information specified in the notice.” (The Environmental Contaminants Act. 1974-75-76, C 72)

c) Section 33. 1 of the Fisheries Act states the following:  
“Every person who carries on or proposes to carry on any work or undertaking that results or is likely to result in  
a) the deposit of a deleterious substance in water frequented by fish or in any place under any conditions where that deleterious substance or any other deleterious substance that results from the deposit of that deleterious substance may enter any such water, or  
b) the alteration, disruption or destruction of fish habitat shall on the request of the Minister... (a) provide the Minister with such plans, specifications, studies, procedures, schedules, analyses, samples or other information relating to the work or undertaking and with such analyses, samples, evaluations, studies or other information relating to the water, place or fish habitat that is or is likely to be affected by the work or undertaking as will enable the Minister to determine  
c) whether there is or is likely to be a deposit of a deleterious substance by reason...d) whether the work or undertaking results or is likely to result in any alternation, disruption or destruction of fish habitat.”  
(Federal Fisheries, 1977, C. 35)

e) In section 5 Department of the Environment Act  
“The Minister in exercising his powers and carrying out his duties and functions under section 4 shall...  
5(ii) ensure that new federal projects, programs and activities are assessed early in the planning process for potential adverse effects on the quality of the natural environment and that a further review is carried out of those projects, programs, and

activities that are found to have probable significant adverse effects and the results thereof taken into account”,

f) Furthermore, in Section 2 of the Environmental Contaminants Act consideration is given to effects that are persistent and cumulative:

“(iii) the extent to which the substance or any class of substances of which it is a member can become dispersed and will persist in the environment.

(iv) the ability of the substance or of any class of substances of which it is a member to become incorporated and to accumulate in biological tissues and to cause biological change.” (The Environmental Contaminants Act. 1974-76)

8. That the principle is set out in the regulations related to the Atomic Energy Board Act that extreme precautions must be taken in the transport of atomic materials:

a) “\*(2) Any person who transports or causes to be transported any radioactive material ...” (See Exhibit A for the list of stipulated regulations for atomic materials)

9. That the principle is expressed in the Emergency Preparedness Act that the government has a duty to make extensive provisions for civil emergency preparedness

( ) THAT in 1992 at Rio, I had some input into the NGO Forest Treaty COMING OUT OF NGO AT RIO

### **COMMENT**

Note: This Forest treaty was negotiated between representatives from Non-Governmental Organizations of many nations from the South and the North, at the Global Forum in Rio de Janeiro, Brazil, during June 1992. The Global Forum was a conference held parallel to the United Nations Conference on Environment and Development (UNCED). The Treaty was negotiated over a period of six days of intense discussions using three working languages: Portuguese, Spanish and English. All decisions were arrived at by consensus and the participants in this Treaty-making process experienced deep feelings of community with each other. This Treaty is not being distributed throughout the world by various organizations. Those who are in general agreement with their Treaty, and are prepared to put it into practices, can formally endorse it and seek the endorsement of other individuals and organizations. The Green Web had two representatives into the NGO Forest Treaty negotiations. We estimate there was a core group of at least 30 people in the negotiations, with intermittent participation by many others.)

## NGO TREATY ON FORESTS

The following definitions are provided for the purpose of this Treaty:

Natural forests are ecosystems dominated by trees or shrubs [growing] in an original or nearly original fashion through natural regeneration. This definition includes mangroves:

"Restore forests are forests planted, seeded, or otherwise restored in such a manner as to emulate the original natural forests of an area.

"Plantations" are crops of trees artificially established, primarily for specific commercial purposes.

Sustainable forest management means securing benefits for human needs while maintaining the structure, function, and integrity of ecosystems on a bioregional basis, incorporating in perpetuity complete forest successions in each bioregion.

"Colonists" are non-aboriginal and traditional people who have recently moved into an area

Native, indigenous and aboriginal peoples are those who have lived in relative harmony with the environment for many generations, and whose origins, as people, are in that area.

Traditional peoples are non-native populations who have established non-destructive relationships with their environmental and have lived there for generations

Preamble:

The undersigned Non-governmental Organizations

Recognizing the vital role of all types of forests in maintaining the ecological processes of the Earth; in protecting ecosystems, watersheds, freshwater resources, coastal areas, estuaries, and adjacent seas; as a rich storehouse of biodiversity; and in carbon fixation:

Recognizing also that all types of forests embody complex and unique ecological processes which are the basis of their present and potential capacity to provide resources to satisfy the biological needs of all forest dependent species, as well as environmental, cultural, historical, and spiritual values:

Believing that forestry issues and opportunities should be examined in a holistic manner, taking into consideration the multiple functions and uses of forest, including living space and cultural survival of the indigenous forest people

Recognizing that many traditional forest dwelling people have had their territories and their ability to pursue their historic cultural activities encroached upon or destroyed:

Noting that the world's forest ecosystems have been dangerously reduced and degraded during more than a century, and that in recent decades the rate of reduction and degradation has been accelerating due to many kinds of exploitation:

Noting also that the consumption of wood products commercially and for fuel wood is at a non-sustainable level and is being met from natural forests rather than from plantations, recycled materials, and other sources;

Noting further the leading part that national and transnational corporations play in degrading forest ecosystems during exploitation and in trading forest products, with minimum benefit to the people in the locality of origin, often displacing them in the process, and often causing social/economic environmental and cultural damage;

Observing that indigenous forest land-tenure systems are highly structured and defined, and are commonly overridden by law, political, and market interests, which reshape access to and control over forest resources:

Observing also that the concentration of power and control over natural resources has resulted in an increase of poverty and deprivation putting increased pressures on forest ecosystems;

Emphasizing that the concentration of property and usufruct of forest land and resources in the hands of a few owners and national and multinational corporations, is a major factor responsible for the deforestation and degradation of forests in many countries; and that this limits the ability of local people to influence the uses of the land:

Acknowledging that responsibility for forest management must be accepted by governments, local NGOs, business, and individuals, without prejudice to the rights of indigenous peoples:

Acknowledging also that indigenous territories including forests must be exclusively managed by indigenous and local people in cooperation with other interested sections of society shall be decided by indigenous and local people:

Declaring that all types of forest and especially wilderness forest have intrinsic values of their own and are essential for the conservation of biodiversity; and are a source of knowledge, inspiration, and spiritual renewal for humanity:

Assert that this treaty applies to all types of forests, restored forests, and plantations in all geographical and climatic zones:

And further assert that the purpose of this treaty is to ensure the conservation, rehabilitation, enhancement, enlargement, national regeneration, planting, protection and sustainable use of the world's forests, as in each case is appropriate to the particular ecosystem

## Principles:

1.1. Forests are essential to life on Earth. The structure, function and integrity of ecosystems must be seen to have infinite value. Every form of forest life is unique and requires adequate habitat and protection.

2. Forests must be protected to supply the social, economic, ecological, cultural and spiritual needs of present and future generations, subject to maintenance of the integrity of soil, water, air and the conservation of biodiversity.

3. Policies in forest conservation shall include the full permanent protection of all forest ecosystem types, the restoration and/or recuperation of degraded or fragmented forests, and the sustainable management of areas under human use.

4. Forest policy must be developed with maximum public consultation and participating especially with local forest people and community groups, and the public must have the right to appear and enforce decisions made in the forestry sector.

5. Forests are the very life of many indigenous people, and therefore their traditional territories must be legally recognized, demarcated, and guaranteed.

6. Traditional forest knowledge and practices of indigenous people must be guaranteed.

7. The struggle for forest conservation cannot be separated from the struggle for agrarian reform in some countries, and the general principles of democratization, social justice and respect for the environment.

8. The rights of indigenous and traditional people who make a living from the non-destructive extraction of forest products (such as rubber tapping and nut picking) should be legally guaranteed in areas they have traditionally occupied. These extractive processes should be recognized, protected, and promoted as a form of sustainable forest management, to alleviate pressure on the forests, to benefit local economies, and to help the global environment.

9. Existing monoculture and exotic plantations which have been planted for timber production should be preferentially harvested in order to take the pressure off the cutting of natural forests. These plantations should generally be converted to mixed plantations of native species.

10 a. In order to maximize biological diversity, natural regeneration of trees should be employed wherever possible.

10b. The role of plantations, restored forests and tree crops (such as fruits and nuts) as sustainable and environmentally sound sources of renewable energy should be recognized, enhanced, and promoted. Plantations and rehabilitated forests can be a means of relieving commercial pressure on

primary or old-growth forests. No land presently under natural or restored forest should be converted to plantations.

10c. Plantation forestry should only occur on non-forested areas, degraded areas, and areas no longer able to support natural regeneration of the native forests, and that are not suitable for food crops. Plantations should not be subject to chemical or biological control or non-organic fertilizers.

10 d restoring forests and establishing plantations on degraded land can play an important role in providing regional employment and development for the benefit of local people, national economies, and the global environment. Before any plantation project is undertaken, environmental impact studies should be done to ensure there are no adverse effects on local economies or the environment.

11. Logging practices that *do not take into account* **cause** habitat destruction, soil erosion, loss of biomass, **loss of biodiversity**, [adverse cultural and economic effects,] or **that the securing of do not allow for** ecologically appropriate regeneration, must be internationally condemned.

12. Environmental costs and benefits *including economic, social, cultural and political values*, [ **Environmental and social costs** ] *should* be incorporated through green accounting into values put on forest resources by market forces and mechanisms and national accounting, and reflected in real prices, permit costs, and fiscal charges, in order to achieve sustainable uses of forests.

13. Government forest agencies should no sell, allocate, or otherwise dispose of forest products unless those transactions show a profit based on the real value of all assets used including trees, land, soil, water, in each forest area involved.

14. Recycling of wood products, especially paper, along with less wasteful logging and processing practices should play a significant part in protecting environmental values and in relieving pressure of demand for new wood.

] in 1991, I submitted, along with Andrew Gage, a revised complaint to the Ombudsman's office, and received an assurance that Steven Owen claimed that Canada would be implementing its undertakings derived from UNCED

( ) THAT in August, I wrote the following op-ed for the Times Colonist

EXHIBIT

*Our international 'green' act is a hollow pretence*

*Op ed in the times colonist  
August, 1992*

Canada violates or ignores international environmental documents to which it has been a signatory while deluding the world community into thinking that it is genuinely concerned about the environment.

At a press conference given by federal Environment Minister Jean Charest at the United Nations Conference on Environment and Development (the Earth Summit) in Rio, a representative of the United Nations introduced Charest as being from a country which was truly concerned about the environment.

During the question period, I indicated the “UNCED should be a time to dispel myths, not perpetuate them, and that Canada is not an ecologically sound country and that we should be honest with the rest of the world.”

Evidence that could dispel the myth that Canada is truly concerned about the environment has been occurring for years throughout B.C. in the forest industry, and is occurring currently in the dispute in Clayoquot Sound.

Rather than the courts in Canada insisting on adherence to international environmental documents such as the World Charter of Nature (UN Resolution 37/7, 1982) or to the current Convention on Biological Diversity (1992), Canadian courts condemn those who strive to call for the adherence to international law (environmentalists) and condone those who ignore international law (industry).

For example, Canada adopted the World Charter of Nature, 1982 (UN resolution 37/7) which states:

“11. Activities which might have an impact on nature shall be controlled, and the best available technologies that minimize significant risks to nature or other adverse effects shall be used; in particular;

a. All activities which are likely to cause irreversible damage to nature shall be avoided;

c) Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed.”

Have governments in Canada since 1982 “avoided” industrial activities such as ecologically unsound “logging practices that have caused irreversible damage to nature”?

Have governments in Canada called upon forest companies to not proceed with ecologically unsound practices whose adverse effects are not fully understood?

This year, Canada is a signatory of the Convention on Biological Diversity which notes:

“That it is vital to anticipate, prevent and attack the causes of significant reduction or loss of biological diversity at source.

“Also, where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat.”

Is Canada reducing the loss of biological diversity at the source, when it is prepared to log old-growth forests before it has carried out adequate research into the biodiversity of the old-growth forests?

Is there not strong evidence that clearcut logging has destroyed biodiversity?

We appear to wait for "scientific certainty" before we are prepared to avoid or minimize such a threat. By that time, there may be very little biodiversity left.

At the press conference where Prime Minister Mulroney signed the Convention on Biological Diversity in Rio de Janeiro, I asked him "if the signing of this document would mean that the government of Canada would condemn ecologically unsound practices such as clearcut logging that destroy biodiversity."

He replied that he did not want to deal with issues.

If Mulroney is willing to sign a document professing to adhere to the preservation of biodiversity, and if he is not willing to deal with the practices that contribute to the loss of biodiversity, the public will have to bring this discrepancy between rhetoric and action to the attention of the international community.

The environmentalists who have been striving to preserve the little remaining old-growth forests, and stressing the need to identify and research biodiversity are the ones who have been adhering to the principles enunciated in the United Nations' World Charter of Nature. They will also be the ones who are calling for the preservation of the old-growth areas so that Canada will be able to adhere to the binding principles enunciated in the United Nations Convention on Biological Diversity.

Yet it is those who act to prevent "irreversibility" that are prosecuted as criminals. While those who cause "irreversibility" are protected by Canadian courts.

Joan Russow of the Ecological Rights Association attended the 1992 Earth Summit in Rio. She lives in Victoria.

Alisha Barcena,  
Executive Director  
Earth Council Organizing Committee  
P.O. Box 323 - 1001 San Jose  
Costa Rica  
FAX (506) 55-2197  
December, 1992

Dear Alisha

I attended the plenary session at ECO-Ed, "Building the capacity for change." At that session, in response to Keith Bezanon's comment that it would be foolhardy to rush into the implementation of Agenda 21, I raised the point that there were a number of principles from the UNCED documents that could be implemented immediately. I then selected a set of principles such as the "Precautionary principle," "the anti-dumping principle," and the "full life cycle analysis principle" to illustrate my point.

I was encouraged by your positive response to my approach of calling upon governments to translate their rhetoric into action. I believe I also mentioned in the plenary that I had designed and circulated a proclamation which I entitled "the UN Proclamation for translating rhetoric into action"; this proclamation was signed by 300 delegates from over 40 countries.

I attended both the New York Prep Com and the Earth Summit as a representative of the Whistler Foundation for a Sustainable Environment, and I attended the Global Forum as a representative of the ERA Ecological Rights Association. At the Global Forum I worked for two days on the final drafting of the NGO Earth Charter, and was part of a press conference where I presented the principles and compared these principles to those in the Rio Declaration.

For a workshop I gave at a UN Association Post Rio Conference in June, I did a content analysis of Agenda 21 and other UNCED Documents. I then decided that I would go through the documents and extract fundamental principles that we could call upon governments to implement. I was able to extract over 200 principles that I believe could be implemented immediately. Although I have been particularly interested in the NGO treaties that emerged from the global forum, I felt that it was also important to work with the documents that had been agreed to by global consensus by governments, and call upon them to adhere to the principles that they had agreed to. I have recently developed with my colleague Fred Knelman, a "Principle-adherence Report Card," and approached the Ministry of the Environment to do an assessment of Canada's adherence to these principles. (One problem that consistently concerned me during the UNCED process, was how Canada gives the impression that it is an ecologically sound country).

Since the Earth Summit, I have been co-instructing a course in Global Issues, in Environmental Studies, and working as a research assistant in the Department of Public Administration in an international project based at Harvard on "Social Learning related to Acid Rain, Ozone depletion and Global Warming. I have continued to develop educational material around the UNCED documents as well as from other international documents the course in "Global Issues." Some of the materials that I have been working on are the following:

1. A comparative examination of the Rio Declaration, NGO Earth Charter, and "An Alternative Charter" that was developed in 1991 by the ERA Ecological Rights Association.
2. An examination of the "Forest Principles" with the Conservation Chair of the Sierra Club and how these Forest principles violate sections of Agenda 21 and other documents.
3. A preparation of references to the Indigenous Rights for a presentation at a conference on "500 years later."
4. A Comparative examination of Principles from the UNCED documents and the principles from a proposed provincial charter for land use.

5. Developing educational material related to principle-based education, with an environmental educator
6. Prepared a life cycle analysis diagram of "Uranium," with Dr Fred Knelman, a physicist and specialist in the linking of civil and military use of uranium.
7. Prepared a series of diagrams revealing the complex interaction of the principles emerging from UNCED documents. This diagram will be the basis for an educational program and for the development of an "environmental auditing proposal."

I have also used the principles from UNCED in a series of briefs: a) to the ombudsman's office asking the office to inquire into how our Provincial government, B.C., will be undertaking to implement UNCED principles related to forestry, such as the requirement in the biodiversity section of Agenda 21, to carry out an environmental assessment of activities that could cause harm to biodiversity; b) to the water district for violation of the precautionary principle for allowing logging in the watershed; c) to the Federal Government for not carrying out an environmental assessment of the berthing of nuclear ships in the urban harbour of Victoria, d) re sewage treatment

I have also used the material from UNCED as a basis for a series of presentations: at ECO- Ed, I presented a paper entitled, "Mis-education through rhetoric: implications for global education", and I will be presenting a paper at the NARST (National Association of Research into Science Teaching) Conference in April on " Mis-education through industrial rhetoric: misinterpretation of UNCED.

I have found generally that the NGO community tends to dismiss the official documentation coming out of UNCED, and to focus on the treaties from the Global Forum. Although I believe that there are systemic constraints that prevented UNCED from going far enough, I believe very strongly in calling upon the governments to implement at least the principles agreed to in the documents.

I was most impressed with your presentation in the plenary and with the way you were able to address the issues raised by the IDRC, and I was excited to hear about the Earth Council.

For years I have been concerned about the destruction of the environment, the escalation of war, the violation of human rights the disregard for social justice and the perpetuation of inequity. At the same time that I have been addressing common security issues, I have been examining , through my academic work, the fragmentation of thought and the imposition of models on the complexity of thought. I am currently completing my doctorate in interdisciplinary studies. My dissertation is on the problem of expressing and communicating complexity.

I would be very interested in being involved in some way with the Earth Council. I am trilingual, English, French, and Spanish.

I am currently on the international Board of Consultants of the Whistler Foundation for a Sustainable Environment; on the Board of Directors of the Vancouver Island Human Rights Coalition; of the World Federalists, of the Vancouver Peace Society; and of the Forest Assembly. I am on the 'Education Committee of the Forest Caucus of the BCEN. I am co-founder of the ERA Ecological Rights Association whose purpose is to advocate the enshrining of ecological rights in National and International Charters. My role in most of these organizations has been to show the interdependence of issues, and to link local, and provincial concerns to global concerns.

Hope to hear from you soon.

Sincerely,  
Joan

Joan Russow. I will be sending you a copy of some of the documents.

- **Disposal at source**

By the year 2000 to establish, as appropriate integrate programmes for tackling pollution at the source and at the disposal site, with a focus on abatement actions in all countries ( 6.41 c Protection of health ) (see sovereignty)

" Governments should encourage industry to treat, recycle, reuse and dispose of wastes at the source of generation, or as close as possible thereto, whenever hazardous waste generation is unavoidable and when it is both economically and environmentally efficient for industry to do so." (20.13 f Hazardous wastes)

" Encourage countries to seek waste disposal solutions within their sovereign territory and as close as possible to the sources of origin that are compatible with environmentally sound and efficient management." (21.31 Solid wastes)  
equal or more stringent standards of origin country  
(" Wherever they operate, transnational corporations and other large-scale enterprises should be encouraged to introduce policies and make commitments to adopt standards of operation with reference to hazardous waste generation and disposal that are equivalent to or no less stringent than standards in the country of origin, and Governments are invited to make efforts to establish regulations requiring environmentally sound management of hazardous wastes." (20.30 Hazardous wastes)

- **Precautionary, anticipatory and life-cycle approaches**

"consider adopting policies based on accepted producer liability principles, where appropriate, as well as precautionary, anticipatory and life-cycle approaches to chemical management, covering manufacturing, trade, transport, use and disposal"  
(19.50 a Toxic chemicals)

" Undertake concerted activities to reduce risks for toxic chemicals, taking into account the entire life cycle of the chemicals. These activities could encompass both regulatory and non-regulatory measures, such ... and the phasing out or banning of toxic chemicals that pose an unreasonable and otherwise unmanageable risk to the environment or human health and those that are toxic, persistent and bio-accumulative and whose use cannot be adequately controlled" (19.50 b toxic chemicals)

- **Need for foresight**

"Each country should develop the knowledge and practical skills to foresee and identify environmental health hazards, and the capacity to reduce the risks. Basic capacity requirements must

include knowledge about environmental health problems and awareness on the part of leaders, citizens and specialists..." (6.46 d Protection of health)

#### •Preventive approach

"A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies." (18.45 Fresh water)

" undertake measures to prevent soil erosion and promote erosion-control activities in all sectors." (13.16 Fragile ecosystem)

" ...other areas of risk reduction encompass the prevention of chemical accidents, prevention of poisoning by chemicals and the undertaking of toxicovigilance and coordination of clean-up and rehabilitation of areas damaged by toxic chemicals." (19,47, Toxic chemicals)

" Governments should include in national planning and legislation an integrated approach to environmental protection, driven by prevention and source reduction criteria, taking into account the 'polluter pays' principle, and adopt programmes for hazardous waste reduction, including targets and adequate environmental control." (20.20 b Hazardous Wastes)

" A preventive waste management approach focused on changes in lifestyles and in production and consumption patterns offers the best change for reversing current trends" (21.7 Solid wastes)

"...could provide for prior environmental impact assessment, systematic observation and follow-up of major projects, including the systematic incorporation of results in decision-making" (17.6 d marine)

"...could provide for periodic assessment of the impacts of external factors and phenomena to ensure that the objectives of integrated management and sustainable development of coastal areas and the marine environment are met" ( 17.6 g Marine)

"it is necessary to conduct regular environmental assessment of the state of the environment of coastal and marine areas" (17.8 c Marine)

"A preventive approach, where appropriate,. is crucial to the avoiding of costly subsequent measures to rehabilitate treat and develop new water supplies." (18.45 Freshwater)

"Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits" ( 20.20 e Hazardous wastes)

#### •Cradle-to-grave approach

"...taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options

for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction” (20.20 e Hazardous wastes)

- **Monitoring cradle to grave approach**

“Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits” ( 20.20 e Hazardous wastes)

- **Culture of safety**

"to promote a 'culture of safety' in all countries, especially those that are disaster-prone, the following activities should be carried out: ( 7.60, Disasters)

- **Responsible care**

:"Industry should be encouraged to.." (19.51 Toxic chemicals))  
"develop application of a 'responsible care' approach by producers and manufacturers towards chemical products, taking into account the total life cycle of such products” ( 19.51 b. Toxic chemicals))

"States should encourage industry to exercise environmentally responsible care through hazardous waste reduction and by ensuring the environmentally sound reuse, recycling and recovery of hazardous wastes, as well as their final disposal” (20.18 d Hazardous wastes)

- **Unacceptability of insufficient or outdated criteria of acceptance**

“Governments, in cooperation with relevant international organizations and programmes, should carry out national reviews, as appropriate, of previously accepted pesticides whose acceptance was based on criteria now recognized as insufficient or outdated and of their possible replacement with other pest control methods, particularly in the case of pesticides that are toxic, persistent and/or bio-accumulative.” (19.55 b Toxic chemicals))

- **Substitution of less harmful**

“... there are often alternatives to toxic chemicals currently in use. Thus risk reduction can sometimes be achieved by using other chemicals or even non-chemical technologies. The classic example of risk reduction is the substitution of harmless or less harmful substances for harmful ones. establishment of pollution prevention procedures and setting standards for chemicals in each environmental medium, including food and water, and in consumer goods, constitute another example of risk reduction” (19.45 Toxic chemicals)

" Reduce over-dependence on the use of agricultural chemicals through alternative farming practices, integrated pest management and other appropriate means" (19.50, Toxic chemicals)

**•Reduction**

" to reduce the generation of hazardous wastes, to the extent feasible, as part of an integrated cleaner production approach" (20.11 a Hazardous waste)

" Establishment of long-term programmes and policies including targets where appropriate for reducing the amount of hazardous waste produced per unit of manufacture" (20.12 d. Hazardous wastes)

**•Minimization**

" Integration of cleaner production approaches and hazardous waste minimizations in all planning and the adoption of specific goals; "(20.11a hazardous wastes)

Economics of prevention??? (20.11c Hazardous wastes)

" Promoting waste prevention and minimization as the principal objective of national waste management programmes" (21.14 Solid wastes)

"States, in cooperation with relevant international organizations, where appropriate, should a) promote policies and practical measures to minimize and limit, where appropriate, the generation of radioactive wastes and provide for their safe processing, conditioning, transportation and disposal" (22.4 a Radioactive wastes)

**•Stabilization**

"Establishment of an intermediate goal for the stabilization of the quantity of hazardous waste generated" (20.12. c Hazardous wastes)

**GATT**

(GATT Working group on Export of Domestically prohibited goods and other Hazardous substances report by the Chairman of the working Group (restricted) July 2 1991)

[Note that the only country which did not agree to this document] was the U.S. The U.S. submitted a "communication" proposing the following changes" ; the U.S. changes will be noted in Italics. ]

Report by Chairman of the working group on Export of Domestically prohibited goods and another hazardous substances [ note linking with " non-transference of goods that are harmful to the environment or to human health] principle in Rio Declaration

At present, although the attached text has been generally agreed by delegations, the country [US] making the reservation remains unable to accept it without amendments.

## Decision on Products Banned or Severely Restricted in the Domestic Market

### Preamble:

Desiring to further the objectives and principles of the GATT

Having regard to the provisions of the GATT as they apply to the products covered by this Decision;

Desiring further to encourage the development of international rules on trade in products that are banned or severely restricted in the domestic market of a contracting party, as well as hazardous wastes, on the grounds that they are dangerous to human, animal or plant life or health, or the environment;

Desiring further to ensure that such rules do not create unnecessary obstacles to international trade nor duplicate the work of other international organizations;

Recognizing the need for complementary action in GATT regarding trade in products covered by this Decision, while taking into account the important contribution that is being made by international organizations which have competence in the areas concerned.

Noting the importance of notification, information exchange systems, prior informed consent procedures and certification systems developed by other international organizations in exchanging information and in assisting contracting parties in deciding whether to permit importation of the products concerned.

Recognizing that every contracting party must assume full responsibility for decisions regarding its own imports, but that the co-operation of exporting contracting parties may be necessary in cases where the importing contracting party's control procedures are not yet fully developed;

Bearing in mind that no contracting party should be prevented from taking measures to ensure the quality of its export products, subject to the requirement that such measures are not applied in a manner that would constitute a means of arbitrary or unjustifiable discrimination between contracting parties where the same conditions prevail, or a disguised restriction on international trade;

Mindful of the need for governments to pay the fullest attention possible to the protection of the environment;

Hereby decide as follows:

### Article 1

#### Coverage

##### 1.1. for the purpose of this Decision

(i) A banned product means any product that has been:

(a) prohibited from sale or use, including those cases in which prohibition results from expiration of the approved period of use; or

(b) refused approval for sale or use; or

(c) withdrawn from sale or use

(ii) A severely restricted product means:  
a product for which virtually all sales and /or uses have been banned but for which certain specific sales and/or uses remain authorized.

With regard to pharmaceuticals, this includes only those

(a) which are approved and subsequently subjected to restrictions that excluded their use in a substantial proportion of potential target population of patients having regard to its safety, and /or

(b) which contain a substance whose dangerous properties require extraordinarily narrow content limitations.

1.2. This Decision applies to products, substances and wastes (hereinafter referred to as " the products concerned") which are determined by a contracting party:

(i) to present serious and direct danger to human, animal or plant life or health or the environment in its territory, and which for that reason are banned or severely restricted in the domestic market of that contracting party by governmental regulatory action, except:

(a) fissionable and radioactive materials; and

(b) arms, ammunition and implements of war supplied directly or indirectly to a military establishment; or

(ii) to be hazardous and which for that reason are required to be disposed of in accordance with governmental regulatory action, except

(a) such wastes which as a result of being fissionable or radioactive, are subject to international control systems, including international instruments, applying specifically to fissionable or radioactive materials; and

(b) such wastes which derive from the normal operations of a ship, the discharge of which is covered by another international instrument.

1.3. The instruments adopted by the relevant international organizations relating to the products concerned are enumerated in Annex 1

## Article 2

2.1. All measures taken to regulate and control international trade in the products concerned shall be applied:

(i) in accordance with the provisions of the General Agreement; and

(ii) for those contracting parties which are signatories to other agreements and Arrangements of GATT, in accordance with the provisions of such agreements and Arrangements to contracting parties which are signatories to them

2.2. Each contracting party shall ensure that the provisions of this Decision are not applied in such a way as to create unnecessary obstacles to international trade.

2.3. Nothing in this Decision shall affect the rights and obligations of signatories or participants under the international instruments enumerated in Annex 1

2.4. The question whether a contracting party, which is a signatory or participant of an international instrument enumerated in Annex 1, is applying the procedures therein, shall be determined by the body which, under that instrument, is competent to do so.

## Article 3

### Measures to be taken by Contracting Parties

3.1. Any contracting party adopting measures to ban or severely restrict in its domestic market any of the products concerned, should examine whether the reasons for such measures would also require the adoption of equivalent measures for exports of the same products.

3.2. However, Article 3.1. should not be construed in such a way as to affect in a discriminatory manner exports of contracting parties which have adopted different standards of health and environmental protection, or the prerogative of individual contracting parties to determine whether to allow, in their specific situations, the import and use of products which the exporting contracting party determines to be products concerned.

3.3. If the bans or severe restrictions referred to in Article 3.1. do not apply to exports of the products concerned, the contracting party shall promptly notify the GATT secretariat of such measures, as well as the reasons for which they were adopted. The GATT secretariat shall immediately forward such notifications to all enquiry points established under Article 5 (b).

3.4. Such a contracting party shall, at another contracting party's request, provide in relation to the products concerned information regarding potential hazardous effects and domestic regulations concerning their use, transport and labeling, including any relevant regulations adopted prior to the entry into force of this Decision.

3.5. The provisions of Article 3.3. shall not apply if the product concerned is covered by an international instrument enumerated in Annex 1 and the exporting contracting party is a signatory or a participant thereof.

## Article 4.

### Co-operation at International Level

4.1. Contracting parties which are signatories or participants of the international instruments enumerated in Annex 1, should sustain and make more effective such international co-operation, inter alia, by participating to the fullest extent possible in the activities undertaken in pursuance of these instruments. Other contracting parties should, where possible, become signatories or participants of such instruments.

4.2. Any contracting party that is a signatory or participant of an international instrument enumerated in Annex 1 should apply the procedures therein to regulate its trade in the products concerned in the manner foreseen by that instrument. Towards this end, such a contracting party should, as appropriate:

- (a) participate effectively in the systems for notification, exchange of information and registration in the relevant instruments;
- (b) participate in the Prior Informed Consent Procedures (PIC) procedure) in the relevant instruments;
- (c) participate in the Certification Schemes incorporated in the relevant instruments; and
- (d) co-operate in the work of international organizations for the further identification of products to which notification systems, prior informed consent procedures or certification schemes should apply

## Article 5

### Transparency and Publication Requirements

Each contracting party shall:

- a) publish promptly all laws, regulations, and administrative rulings insofar as they relate to international trade in the products concerned, in accordance with the provisions of paragraph 1 of Article X of the General Agreement;
- (b) establish or designate an enquiry point (s) from which the further information referred to in Article 3.3. could be obtained;
- (c) submit promptly to the GATT secretariat the name (s) of the bodies which shall act as the enquiry point (s)

1. Environmental representative indicated that this document was initiated by some of the African countries, and that there needs to be pressure from the African countries to reopen this discussion

~1993

1991-1993 NOTE RESPONSE OF STEVEN OWEN  
COMPLAINT FILED BY JOAN RUSSOW AND ANDREW GAGE

#### MEETING WITH THE OMBUDSMAN: WHO INVESTIGATES THE INVESTIGATOR?

Often intact ecosystems that have been deserving of preservation or sensitive environmental areas that are worthy of protection have been irreversibly destroyed because it was deemed necessary for governments to pay compensation. In the past, compensation has been assessed purely from an economic basis without taking into consideration the true environmental costs. In the documents coming out of the Earth Summit there is a commitment to consider the true environmental costs, and to carry out a "full life cycle analysis" of industrial activity. In order to assess the environmental costs of the destruction of significant ecosystems and sensitive environmental areas one may need to examine the nature and extent of accumulated environmental harm cause by industrial activity over time, and carry out a full life cycle analysis of this activity. Over the years governments have entered into contracts, such as tree farm licensees, or industrial development permits, and as a result of either non-existent environmental protection or non-compliance/enforcement of current statutes and regulations, irreversible environmental damage has occurred.

In the past environmental damage was considered to be "collateral damage," a natural, inevitable and acceptable outcome of industrial growth. Now, there is the current acknowledgement by all levels of government of the importance of addressing environmental degradation. The international community has endorsed along with the principles mentioned above, the precautionary principle. In addition, the Federal Government has made an international commitment at the Earth Summit to comply with the following principles which require:

1. the carrying out of environmental impact assessments;
2. protecting of indigenous people from environmentally unsound, or socially or culturally inappropriate practices;
3. introducing the polluter-pay principle;

4. the undertaking of the life cycle analysis (See principles in Appendix).

#### THE COMPLAINT

Initially the complaint was submitted in September 1991; the complaint however was not seriously considered until December 1992. At the December 1992 meeting the original complaint was modified and the "investigator" agreed to investigate the following complaint

Submission to the Ombudsman's office  
by Joan Russow and Andrew Gage

1. We request the Ombudsman's office to undertake an inquiry into what measures the British Columbian government will be undertaking to comply with principles from the UNCED documents. The following is a list of principles that could be examined. (See attached set of principles)

2. We request the Ombudsman's office to undertake to investigate the following implications resulting from possibly unfair administrative decisions:

Often intact ecosystems that have been deserving of preservation have been irreversibly destroyed because it was deemed necessary, if these ecosystems were to be withdrawn from an existing tree farm licence, for governments to pay compensation. In the past, compensation has been assessed purely from an economic basis without taking into consideration the true environmental costs. In order to assess the environmental costs of the destruction of significant ecosystems one may need to examine if damage to the natural environment within a significant ecosystem has occurred. Section 60 of the Forest Act does permit the suspension of licenses if environmental damage to the natural environment has occurred as a result of non-compliance with the Forest Act. The potential environmental costs of destroying significant ecosystems as a result of the Ministry of Forests not suspending tree farm licenses when there was evidence of destruction to the natural environment is necessary to include in the assessment of compensation. Although, often the companies that have contributed in the past to the destruction of significant ecosystems may not be the current holders of the specific tree farm licence in the area containing the significant ecosystem, most of the companies are still functioning in British Columbia. This investigation of the environmental costs would involve the whole province so that there would need to be a global assessment of environmental costs incurred by the companies, not a valley-to-valley assessment.

The complainants met with the senior "investigator" on February 5, 1993. At this meeting the senior investigator claimed to have investigated the

complaint. He first dealt the inquiry into B.C.'s compliance to specific principles agreed to in Rio. He indicated that he had contacted "senior officials" in the Ministry of Forests and the Department of Forestry, and that he was assured by them that the new Forestry Code would incorporate these principles and "even exceed world standards." When the complainants commented that one indication of world standards was the condemnation in European countries of "clear-cut practices," he responded that when comparing Canada with other countries it was important to consider the number of species that were logged here. When asked if "the senior officials" had agreed to include specific principles such as the requirement to conduct an environmental assessment review of any practice that could destroy biodiversity, and if they had agreed to carry out an environmental assessment review of practices such as clear-cut logging, he responded that it would not be fair to criticize the code because it was not yet completed. When asked if they had agreed to incorporate the precautionary principle, he admitted that he had not asked about the specific principles that had been included in the complaint. He then commented on how well the Ministry of Forests was carrying out its duties. The complainants responded that Cuthbert, the Deputy Minister of Forests had completely reversed the precautionary principle in the Sooke water basin by stating that, since there was no scientific certainty that logging would destroy the quality of the drinking water, we should continue to log in the watershed. The "investigator" from the ombudsman's office responded that the issue was not "whether to log in the watershed" but "how to log." One of the arguments that had been used by industry was the argument put forth by the "investigator"

The first part of complainants' request, although it included forestry, was not specifically confined to forestry. The long list of principles was directly related to environmental policy generally and specifically to the current decision to allow Alcan to proceed with the Kemano project. It was pointed out to the "investigator" that if the Canadian and British Columbian government permit Alcan to proceed with its project, Canada and British Columbia will be in violation of almost all of the principles that were included in the complaint. Harcourt, the Premier of B.C., held a press conference and claimed that the agreement with Alcan was "legally binding" and that breaking the agreement could cost B.C. taxpayers well over half a billion dollars in compensation to Alcan. If one reads the report by the lawyer, one becomes aware that the legal implications of the agreement are much more complex. The press release indicates that the B.C. government will carry out a "public review" of the impacts; this review is substantially different from an environmental assessment review of the impacts. In the former the project is allowed to proceed and the impacts are examined, whereas in the latter the project could be halted if it could be shown that significant adverse environmental effects could ensue. It was pointed out to the "investigator" that by not requiring an environmental assessment review, the government is allowing the spectre of compensation to detract from its commitments to environmental principles. No mention was made about carrying out a full life cycle analysis of the environmental impact of the process of producing aluminum, no mention of the precautionary principle, and no mention of the duty to native people (see principles in appendix).

The "investigator" then addressed the second part of the complaint, which was directly related to preservation of, and environmental harm to ecosystems, and the consideration of environmental costs in the assessing of compensation.

He informed the complainants that he had contacted Steven Owen, the former ombudsman of B.C. now the Commissioner of the CORE (Commission of Resources and Environment); a commission that is purported to be set up "to create world-leading standards for land use planning and allocation" (Annual Report, Ombudsman's Office, 1991, 89). Steven Owen assured him that the complaint was being looked after, and that "all the concerns of VINE Vancouver Island Network of Environmentalists" had been addressed. The complainants were aware of the criteria or preconditions for participation in the CORE process. One of these criteria was that there should be adherence to the fundamental principle that significant options that are purported to be considered should not be irreversibly destroyed while the process proceeds. To ensure compliance with this principle VINE stated as a precondition for participation more extensive set asides to fulfill the option for preservation should be made. After the meeting with the "investigator" the complainants contacted a spokesperson from VINE and the Conservation sector, and were informed that this condition has not yet been met.

Not only are significant unfragmented ecosystems which have been identified as being worthy of preservation, such as areas of Clayoquot, Walbran etc., still being logged, but also many significant ecosystems are being logged before they are even identified as being significant. One reason for not setting aside these significant ecosystems is again the raising of the spectre of compensation. The second part of the complaint to the ombudsman's office was to address the issue that the environmental harm that has occurred as a result of industry's not complying with the Forest Act, and as a result of the Ministry of Forests failure to suspend licenses when there was evidence that environmental harm has been caused by non-compliance with the Forest Act should be taken into consideration when there are claims by industry for compensation.

For years, environmental harm has occurred because of failure on the part of government to enforce its own legislation. It was pointed out to the "investigator" that the companies had been in non-compliance with their contractual obligations and with the Act by not protecting fish habitat. For years environmentalists and the Federal Ministry of Fisheries have been documenting violations of section 33 of the Fisheries act which states that it is a criminal offence to deposit deleterious substances, which could cause harm to fish habitat, into streams. In response to this statement of industry's violation of the Contractual obligations, the "investigator" commented that it was the responsibility of the Fisheries Department to take action. It was subsequently pointed out that Fisheries had been used as an example of the way in which industry had been in non-compliance with the Forest Act, and, to a certain extent through this non-compliance, been in violation with contractual obligations, and thus the Ministry of Forests had been remiss in not applying section 60 to suspend the forest licenses. And as a result, environmental harm had been occurring for years. He responded by stating

that "it was not practical to investigate past practices, and the industry had improved a lot" The "investigator" also made a comment that we always strive for the idyllic but have to be satisfied with less, and it is not practical to go back and investigate the environmental harm in the past, and he kept reiterating that although there had been problems with Forestry in the past, forest practices were improving. The complainants commented that if there is one place where it should be possible to go beyond the practical and discuss the rightness and fairness, it should be in the Ombudsman's office. The complainants then indicated how few significant ecosystems remain and that there was substantial evidence that forest practices, in particular clear-cut logging, continue to destroy biodiversity. He then responded "show me an example," which suggested either his commitment to investigate malpractice, or his challenge to come up with even one example.

At this point the complainants made a comment that if when he had started working in the Ombudsman's office, 9 1/2 years ago, he had taken the initiative to investigate non-compliance with the Forestry Act, which is part of the mandate of the Ombudsman office, there might have been many more intact ecosystems saved. The complaints then asked where they can go to have their questions addressed further: to the Ombudsman herself, and she said "I speak for the Ombudsman's office."

The complainants then responded that they would be going to the press, the "ultimate investigator", and he said remember to be farther questions are still to be asked: Is it possible to be fair, about the unfairness of the investigative process that is supposed to investigate unfairness, and "Who investigates the investigator?"

Environmentalists have been condemned as criminals by the courts for attempting to prevent irreparable harm to intact ecosystems, and they have been rejected by the "investigator", where do they turn for justice.

## PRINCIPLES REFERRED TO IN THE COMPLAINT

### PRINCIPLES OF MORAL SUASION AND LEGAL OBLIGATIONS

These principles are derived from documents, like Agenda 21 and the Rio Declaration, which are not legally binding or from the legally binding Biological Diversity Convention which was signed and ratified on December 4, 1992.

At the Earth Summit in Rio, in the document, Canada's National Report, submitted to the Conference, Canada gave the impression that Canadians observed their environmental responsibility as stewards of a vast and beautiful land, and as a people intimately connected to the environment, Canadians are aware of their environmental responsibilities. (Canada's National Report, Preface)

And further the section on the "quality of life", the Canadian government stated

“As a small population with a large land mass, Canadians have access to relatively unspoiled wilderness areas rich in wildlife ... Canada has an international reputation as a beautiful, safe and mostly unspoiled country.” (Canada's National Report, p.49)

If we continue to give the impression to the global community that we are concerned about the environment, then we should immediately act to live up to our international commitments whether or not they are or are not yet legally binding.

## PRINCIPLES DRAWN FROM INTERNATIONAL DOCUMENTS

### 1. Prior-assessment-in-decision-making-principle

“Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences” (Agenda 21,7.42)

### 2. Positive-duty-to protect-indigenous lands principle

“Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate; recommendations” (Agenda 21, 16.3 ii)

### 3. Precautionary principle

" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).

If Canada were to comply with this principle, then all threats of serious irreversible damage would cease or be mitigated. Compliance with this principle could mean that Canada shall cease logging in catchment areas from where communities derive their water. No longer would representatives from resource ministries be able to claim, "there is no scientific certainty that logging will cause harm, therefore we can log the catchment area. (Paraphrase of remark by Cuthbert from the Ministry of Forests)

### 4. Recognition of non-damaging use value principle

the implications of the harvesting of forest resources for the other values of the forest should be taken fully into consideration in the development of forest policies. It is also possible to increase the value of forests through non-damaging uses such as eco-tourism and the managed supply of genetic materials. Concerted action is needed in order to increase people's perception of the value of forests and of the benefits they provide. (Agenda 21, 11.22)

If Canada were to comply with this principle, it would give serious consideration to the economic value of non-damaging use prior to destroying this significant alternative. Compliance with this principle could mean that the courts could look unfavourably on those who claim that "irreparable harm " could be construed as loss of "damaging-use" jobs. Damaging use could then be perceived as bringing about not only irreparable harm but also a " loss of ecologically sound employment"~

#### 5. Preventive, precautionary and anticipatory approach principle

"...apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it;" (Agenda 21, 17.23 a)

If Canada were to comply with these principles, then serious consideration would be given to avoid environmental degradation.

#### 6. Preventive-to avoid costly corrective measures principle

"A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate treat and develop new water supplies." (Agenda 21, 18.45)

If Canada were to comply with this principle, then all real environmental costs would be assessed before a project, product or activities were authorized

#### 7. Cradle to grave approach monitoring principle

"Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits" (Agenda 21, 20.20 e)

If Canada were to comply with this principle, then a real environmental audit taking into consideration the environmental impacts at all stages of the production, circulation and disposal of the products (cradle to grave) would be done of industries whose actions could have potentially significant environmental impacts. This principle involves the recognition that

governments have the responsibility for monitoring through the cradle to grave approach.

#### 8. Positive-duty-or-responsibility principle

“...the responsibility to conserve their biodiversity and use their biological resources sustainably, and to ensure that activities within their jurisdiction or control do not cause damage to the biological diversity of other states or of areas beyond the limits of national jurisdiction. ” (Agenda 21, 15.3)

If Canada were to comply with this principle Canada could fulfill this responsibility by seriously considering the conversion of activities that destroy biodiversity. Instead of condemning practices that the international community would condemn as being harmful to biodiversity such as clear-cut logging, broadcast burn, pesticide use, and plantations, Canada has not only granted injunctions against those who protest Canada's failure to fulfill its international responsibility. but also, has condemned and imprisoned those who defy the injunction. Canada, through its omitting to condemn practices that destroy biodiversity, is seriously jeopardizing its ability to comply with its legal commitment to the Biodiversity Convention, once it is ratified. Canada, through its omitting to condemn the industry's redefinition of "sustainability," "biodiversity," and "old growth" (see publications by Forest Industry) is allowing the perpetuation of those practices that could lead to the elimination of significant ecosystems required for the preservation of biodiversity.

#### 9. Polluter pay principle

“Governments should include in national planning and legislation an integrated approach to environmental protection, driven by prevention and source reduction criteria, taking into account the 'polluter pays' principle, and adopt programmes for hazardous waste reduction, including targets and adequate environmental control” (Agenda 21,20.20 b)

If Canada were to comply with this principle, then Industry would be called upon immediately to pay for the cost of environmental clean-up. Compliance with this principle could require that the past and present pollution costs would have to be considered in the assessment of compensation in cases where industry has been closed down or displaced for environmental reasons. Also, more serious consideration might be given to conversion to non-damaging uses that would not entail subsequent environmental costs.

#### 10 Prevention-through-effective-enforcement principle

“Effective prevention requires action through effective monitoring and the enforcement and imposition of appropriate penalties” (Agenda 21, 20.20)

If Canada were to comply with this principle, then Canada could either increase the budget for monitoring violations of existing international and national legislation. or could save monitoring and enforcement costs by insisting of ecologically sound initial practices. Compliance with this principle could result in i.e. strict enforcement of section 33 of the Fisheries Act. or in the ceasing of the perpetuation of "rectification of error syndrome" i.e., the initial harmful practice, which requires subsequent potentially harmful practices.

#### 11. Not-transferring-environmentally-harmful-activities or substances principle

"States should effectively cooperate to discourage or prevent the relocation and transfer to other states of any activities and substances that cause severe environmental degradation or are found to be harmful to human health" (Principle 14, Rio Declaration)

If Canada were to implement this principle, the government would prevent the transfer by industry of any activities or substances that had been deemed unsafe in Canada. or unsafe in any country that has higher standards than those in Canada. Compliance with this principle could involve a full life cycle analysis of the environmental and health implications of the product or activity. Also, compliance with this principle could cause the transfer of health products and pesticides (those banned or restricted in Canada or in any other country) as well as the transfer of. uranium, ecologically unsound logging practices ...to cease.

#### 12. Anticipatory and life-cycle-approach principle

"Consider adopting policies based on accepted producer liability principles, where appropriate, as well as precautionary, anticipatory and life-cycle approaches to chemical management, covering manufacturing, trade, transport, use and disposal" (Agenda 21, 19.50 a)

If Canada were to comply with this principle, the government would reveal the true-life cycle of each potentially harmful product or activity, so that the full environmental impact [or harm to human health, principle non-transferring...] of the product or activity could be understood. Compliance with this principle, could result in the full environmental impact of uranium mining; civil nuclear, current forest practices, resources extraction, pesticide use being done.

#### 13. Environmental-impact-assessment principle

"Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the assessment of the impacts of relevant policies and programmes on biological diversity" (Agenda 21, 15.5 k)

If Canada were to comply with this principle, Canada would require an environmental impact assessment of industries and industrial practices that could have an impact on the conservation of biodiversity. Compliance with this principle could bring about the environmental assessment of forest practices (the provincial government has not agreed to extend environmental assessment to forest practices)

#### 14. Promotion of arms-length-research principle

“Governments and institutions, in collaboration where necessary with appropriate international agencies and organizations, Universities and non-governmental organizations should undertake assessments and systematic observations of forests and related programmes and processes with a view to their continuous improvement.” (Agenda 21,11.34)

If Canada were to implement this principle, Universities would refuse research funding from major industries that contribute to environmental degradation because often this research funding has led either to selection of areas of research, nature of research, and final acceptance of research. Forest companies. would no longer have controlling influence into research conducted in faculties of Forestry.

“Ecological and human health affects measurable consequences of environmentally destructive model principle

Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems.” (Agenda 21, 18.45)

Prohibition of harmful substances principle

“Considering the prohibition of those [harmful pesticides, fertilizers] found to be environmentally unsound” (Agenda 21, 17.28. i)

Replacement-of-safe-alternative principle

Governments should intensify research and development activities on cost-effective alternatives for processes and substances that currently result in the generation of hazardous wastes that pose particular problems for environmentally sound disposal or treatment, the possibility of ultimate phase-out of those substances that present an unreasonable or otherwise unmanageable risk and are toxic, persistent and bio-accumulative to be considered as soon as practicable. *???Emphasis should be given to*

*alternatives that could be economically accessible to developing countries ???(Agenda 21, 20.13. c)*

Promotion of phase-out-of-risk research principle

" States, with the cooperation of international organizations *where appropriate*, should encourage industry to promote and undertake research into the phase-out of the processes that pose the greatest environmental risk based on hazardous wastes generated. (Agenda 21, 20.18 b)

Foresight principle

"Each country should develop the knowledge and practical skills to foresee and identify environmental health hazards, and the capacity to reduce the risks. Basic capacity requirements must include knowledge about environmental health problems and awareness on the part of leaders, citizens and specialists... (Agenda 21, 6.46 d)

Culture of safety Principle

This principle involves the commitment to act to prevent rather than to [correct] "To promote a 'culture of safety' in all countries, especially those that are disaster-prone, the following activities should be carried out: (Agenda 21, 7.60)

Responsible-care-principle

Industry should be encouraged to develop application of a 'responsible care' approach by producers and manufacturers towards chemical products, taking into account the total life cycle of such products (Agenda 21, 19.51 b.)

Responsible-care-linked-to-life-cycle principle

This principle involves the recognition that responsible care is dependent upon revealing of life cycle of products

Industry should be encouraged to develop application of a 'responsible care' approach by producers and manufacturers towards chemical products, taking into account the total life cycle of such products (Agenda 21, 19.51 b.)

Concept of environmental care principle...

Empower community groups, non-governmental organizations and individuals to assume the authority and responsibility for managing and enhancing their immediate environment through participatory tools, techniques and approaches embodied in the concept of environmental care. (Agenda 21, 7.21. g)

Cradle to grave approach impact assessment principle

"Governments should take the lead in establishing and strengthening, as appropriate, national procedures for environmental impact assessment, taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation

of hazardous wastes, through safer handling, storage, disposal and destruction” (Agenda 21, 20.20 e)

“Entire-life-cycle risk reduction principle

This principle involves the recognition that only through examining the full life cycle of a product can the risk be reduced

“Risk reduction involves broad-based approaches to reducing the risks of toxic chemicals, taking into account the entire life cycle of the chemicals.” (Agenda 21,19.45,)

“Prior assessment of potential adverse impacts principle

“ Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment;” (Agenda 21,17.23 b)

“Prior-assessment-in-decision-making-principle

Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences” (Agenda 21,7.42)

“Standards-no-less-than country of origin principle

(“ Wherever they operate, transnational corporations and other large-scale enterprises should be encouraged to introduce policies and make commitments to adopt standards of operation with reference to hazardous waste generation and disposal that are equivalent to or no less stringent than standards in the country of origin, and Governments are invited to make efforts to establish regulations requiring environmentally sound management of hazardous wastes.” (Agenda 21,20.30)

“Minimize or avoid environmental damage principle

Adopt policies that minimize if not altogether avoid environmental damage, whenever possible” (Agenda 21, 7.42 a)

Substitution of less harmful principle

“...there are often alternatives to toxic chemicals currently in use. Thus, risk reduction can sometimes be achieved by using other chemicals or even non-chemical technologies. The classic example of risk reduction is the substitution of harmless or less harmful substances for harmful ones. establishment of pollution prevention procedures and setting standards for chemicals in each environmental medium, including food and water, and in consumer goods, constitute another example of risk reduction” (Agenda 21,19.45)

Positive-mandate-to- conserve principle

“ Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values,

including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources, involving in situ and ex situ measures and undertaking supportive measures to ensure sustainable utilization of biological resources and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities;" (Agenda 21, 11.15 b)

Positive-mandate-to-be-consistent with requirements of international law principle

" Governments... and consistent with the requirements of international law should, as appropriate Identify and evaluate the potential economic and social implications and benefits of the conservation and sustainable use of terrestrial and aquatic species in each country, building upon the results of country studies" (Agenda 21,15.6.)

Positive-long-term-research-into-biodiversity- in ecosystems principle

" Long-term research into the importance of biodiversity for the functioning of ecosystems and the role of ecosystems in producing good, environmental services and other values supporting sustainable development with particular reference to the biology and reproductive capacities of key terrestrial and aquatic species, including native, cultivated and cultured species? Observation and inventory techniques; ecological conditions necessary for biodiversity conservation and continued evolution; and social behaviour and nutrition habits dependent on natural ecosystems, where women play key roles. The work should be undertaken with the widest possible participation, especially of indigenous people and their communities, including women." (Agenda 21, 15.5 f,)

Promotion of environmentally sound technology research principle

"Promoting research and development in environmentally sound technologies" (Agenda 21, 4.18 b)

Assignment of responsibility principle

"Noting that the largest share of historical and current global emissions of greenhouse gases has originated in developed countries, that per-capita emissions in developing countries are still relatively low and that the share of global emissions originating in developing countries will grow to meet their social and development needs." (United Nations Framework Convention on Climate Change, 1992)

15. Limit access-of-industry-to-environmental-decision- making principle

In chapter 36 of Agenda 21, a very important distinction is made between promoting "education," promoting "public awareness," and promoting "training." It appears to be clear in Agenda 21 that non-governmental

organizations, community-based groups, women's groups and aboriginal groups are called upon to assist educational authorities in reorienting education. The role of industry is ascertained to be limited to specific areas of business and industrial and training programs.

" Educational authorities, with appropriate assistance of non-governmental organizations, including women's and indigenous peoples' organizations should promote all kinds of adult education programmes for continuing education in environment and development, basing activities around elementary/secondary schools and local problems. The authorities and industry should encourage business, industrial and agricultural schools to include such topics in their curricula. The corporate sector could include sustainable development in their education and training programmes." Agenda 21, section 36.5 l

In the section of Agenda 21 that addresses the "promoting of public awareness " industry is included not as the dispenser of "education" but as the recipient of needed education.

"Countries and regional organizations should be encouraged, as appropriate, to provide public environmental and development information services for raising the awareness of all groups, the private sector and particularly decision makers." (Agenda 21, section 36.10 c)

In the section of Agenda 21, that addresses the "promoting of training, an important role for industry is envisioned.

"To strengthen national capacities, in training, to enable governments, employers and workers to meet their environmental and development objectives and to facilitate the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know -how" (Agenda 21, 36.13 c)

If Canada were to implement this principle, the government would not include representatives from industry on Round Tables that are to determine the philosophical underpinnings of education. or Government would not prepare environmental material with an industry bias for the educational system ("All things Considered"). Canada could, however, encourage industry to be involved in job conversion to ecologically sound and socially acceptable practices.

"Promotion of alternative models of consumption to meet basic needs of humanity principle

to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity” (Agenda 21, 4.7.a)

If Canada were to implement this principle, the government, institutions, industry, and individuals would cease promoting the traditional model of over-consumption. Compliance with this principle would mean that loss of jobs in consumptive areas could not be an excuse perpetuation the over-consumption model.

( ) **THAT in 1993** I met with Jag Maini, Minister of Forests, and discussed the document that I prepared;

EXHIBIT  
RE-EXAMINATION OF THE FINAL "UNOFFICIAL" VERSION OF THE DOCUMENT "LAND RESOURCES; DEFORESTATION, (JUNE 16, 1992)" IN THE LIGHT OF COMMITMENTS MADE IN AGENDA\_21, RIO\_ DECLARATION, AND OTHER INTERNATIONAL DOCUMENTS; AS WELL AS IN THE LIGHT OF RECOMMENDATIONS MADE BY ERA ECOLOGICAL RIGHTS ASSOCIATION. WITH THE ASSISTANCE OF OTHER ENVIRONMENTAL GROUPS

( ) THAT IN 1993, I Gave a presentation on NAFTA

EXHIBIT

DRAFT: for discussion purposes only

"NAFTA: THE DISCREPANCIES BETWEEN THE ENVIRONMENTAL PROVISIONS IN NAFTA AND THE CANADIAN GOVERNMENT'S PUBLISHED INTERPRETATION OF THESE PROVISIONS

Prepared for presentation at a panel discussion on

NAFTA

by

JOAN RUSSOW  
DOCTORAL CANDIDATE  
INTERDISCIPLINARY STUDIES  
UNIVERSITY OF VICTORIA

May, 22, 1993

In all three countries, Canada, Mexico and the U.S., citizens and organizations are concerned about

- the misplacing of government priorities,
- the delusion of public process,
- the exploitation of the labour force,
- the inequitable distribution of resources,
- the disenfranchisement of the many,
- the violation of human rights and
- the denigration of social justice

In all three countries, citizens and organizations are also concerned about the unquestioned imperative to grow,

- the over-consumptive pattern of behavior,
- the relentless destruction of the environment, and
- the irreversible loss of ecological heritage

These concerned citizens look with justified trepidation at NAFTA

In this talk I will be examining the potential discrepancy between the stated environmental provisions in NAFTA and the Canadian Governments published interpretation of these provisions in the Canadian Environmental Review.

## Background

Within Canada, United States and Mexico there are laws, policies, and regulations in place which appear to conserve, preserve and protect the environment;  
yet industry is continually in non-compliance with these environmental provisions, and government is continually remiss in not requiring compliance.

The three countries negotiating the NAFTA all enunciate in their national legislation environmental provisions

## Mexico

**" Social liberalism** therefore proposes a State that promotes and encourages private initiative, **but has the capability to firmly regulate economic activity and thus prevent the few**

**from taking advantage of the many; a State that channels attention and resources towards meeting Mexicans' basic needs, is respectful of labor rights and union autonomy, and protects the environment." (Carlos Salinas de Gortare, Social Liberalism: Our Path, Mexico: On the Record. Vol. 1. No. 4 ( March 1992)**

**In March 1988, Mexico enacted its General Law for Ecological Equilibrium and Environmental Protection.** it is a comprehensive statute designed to ensure that there is an adequate legal basis for protecting the environment. Indeed, the law is based in large part on U.S. law and experience.  
**A central element of the 1988 law is the requirement for environmental impact assessments to be completed on all new investment projects, in both the public and private sectors. To ensure they comply with these requirements, many privately owned companies have already created special environmental offices to analyze the environmental impacts of proposed business activities** ( U.S. government publication] Free trade Negotiations with Mexico Environmental matters, p. 3 ) ARMS LENGTH RESEARCH

In Canada, the government claims that :

Canada's Green Plan is second to none in its comprehensive approach to a full range of environmental challenges, funding, accountability and provision for public involvement , " he [Mr. de Cotret ] added.

Canada's Green Plan offers new policies, programs and standards to clean up, protect and enhance our land, water and air, our renewable resources, the Arctic, parks and wildlife, and to reduce waste generation and energy use. it also includes measures to maintain global environmental security, foster environmentally responsible decision -making and improve our emergency preparedness....

. (Government of Canada's release " Federal Government releases environmental green plan" December, 1990.)

Goal

to ensure that citizens today and tomorrow have clean air, water and land essential to sustaining human health and the environment....p. 1 ....

INITIATIVES

• **Over the next five years, strengthen federal inspection, information exchange and investigation programs to better enforce environmental regulations ....**

**In 1991, develop and adopt a comprehensive Code of Environmental Stewardship covering all areas of federal operations and activities.** The Code will be complemented by a list of targets on issues ranging from waste generation to

contaminated sites clean-up and emission standards, establishment of an office of Environmental Stewardship and measures to ensure that federal purchasing policies and practices integrate environmental considerations. Implementation of the code will ensure that the activities and operations of the federal government meet or exceed the standards and practices it is recommending for others. ( p. 21) Government of Canada's release " Federal Government releases environmental green plan" December, 1990.)

In the United States, President Bush stated that:

"We will ensure that our right to safeguard the environment is preserved in the NAFTA

- we will maintain the right to exclude any products that do not meet our health or safety requirements and we will continue to enforce those requirements
- we will maintain our right to impose stringent pesticide, energy conservation, toxic waste, and health and safety standards
- we will maintain our right , consistent with other international obligations, to limit trade in products controlled by international treaties ( such as treaties on endangered species or protection of the ozone layer). [TWO OF THE VERY FEW INTERNATIONAL AGREEMENTS SIGNED BY THE US]

- Enhancement and Enforcement of Standards: we will seek a commitment to work together with Mexico to enhance environmental health and safety standards regarding produces and to promote their enforcement
- we will provide for full public and scientific scrutiny of any change to standards before they are implemented.
- we will provide for consultations on enhancing enforcement capability, inspection training, monitoring and verification ( Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991)p.p. 4, 5)

Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991)

- we will consult on national environmental standards and regulations, and will provide an opportunity for the public to submit data on alleged non-compliance." (Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991, p. 5)

YET the moment that either one of the three states attempts to "enhance" environmental protection the others call forth the spectre of the trade agreement GATT:

Each one of the three states involved has attempted to object to the other state's enhancing environmental standards and in each case GATT has supported the state seeking to object to high standards:

In Canada,

**"The Canadian pulp and paper industry has urged Canada to challenge U.S. laws requiring the use of recycled fibre in newsprint. (Shrybman, 1991, p. 13)** The Canadian government has argued that a U.S. environmental Protection Agency rule banning the use of all forms of asbestos violates the U.S. Canada FTA and GATT( Eric Christensen, "Pesticide Regulations and International Trade", Environment, Vol. 32. No. 9, November, 1990, p 45)

In the U.S.

**"The U.S. recently proposed in GATT negotiations that nations be prevented from adopting domestic pesticide standards more stringent than international standards."** (Eric Christensen, "Pesticide Regulation and International Trade", Mark Ritchie, "GATT, Agriculture and the Environment: The US Double Zero Plan, " The Ecologist, Vol. 20, No. 6, November, 1990, p. 214.)

**"The U.S. based Non-Ferrous Metals Producers Committee is using the U.S.- Canada FTA to support its challenge to Canadian federal and provincial pollution control programs intended to reduce emissions from the Canadian smelting industry."** (Shrybman "Selling the Environment Short: an environmental assessment of the first two years of free trade between Canada and the United States", Canadian Environmental Law Association, January, 1991, p. 13) (cited in Rolfe, Chris Environmental considerations regarding a possible Mexico-Canada Free trade Agreement for the West Coast environmental law association, February, 1991).

And in Mexico ...

When in 1990 the US. placed an embargo upon tuna products from Mexico, "Mexico complained that the tuna embargo was inconsistent with obligations owed to Mexico under GATT. The September 1991 report of a three-member panel of experts established pursuant to the third-party dispute settlement procedures of GATT determined that the American embargo on Mexican tuna, even though designed to conserve dolphins [s] was inconsistent with the GATT ( McDorman, T. 1991, p. 2)

It would appear that, in all three countries (including states and provinces) there is not the political will required to seriously address the urgency of the environmental crisis.

Will the NAFTA perpetuate the current North American environmental situation of strong but not-enforceable legislation and regulations, will the NAFTA worsen the current North American environmental situation or could an alternative to the NAFTA lead to stronger enforcement of environmental legislation

From the press release on Friday May 21, it would appear that the three day talks on the side environmental accords failed because the U.S. negotiator demanded the standards be enforceable through trade sanctions.

In the absence of any further information about the current discussion about the parallel accord related to the environment, I will only be able to refer to the actual NAFTA agreement itself. A representative from the Ministry of Environment, who was part of the parallel accord information loop, indicated that the purpose of the parallel accord was primarily to clarify some of the environmental provisions, and address some of the concerns expressed about some of these provisions.

#### "NAFTA: THE DISCREPANCIES BETWEEN THE ENVIRONMENTAL PROVISIONS IN NAFTA AND THE CANADIAN GOVERNMENT'S PUBLISHED INTERPRETATION OF THESE PROVISIONS

"To make a comparison between the environmental provisions of NAFTA and the Canadian Government's published interpretation, I have extracted and compiled in this diagram, the provisions in the NAFTA related to the environment" (see NAFTA GRAPH) and linked them to the statements published by the Canadian Government in their publication NAFTA: Canadian Environmental Review, Oct. 1992.

In this diagram I have attempted through to document five categories of statements:

1. statements in the NAFTA related to the environment
2. Statements by the Canadian Government in the Canadian Environmental Review, October, 1992. Re: the environmental implications of the NAFTA
3. Focal points to pursue related to statements in the NAFTA
4. Focal points to pursue related to statements made by the Canadian Government
5. Systemic "whereases" and "notwithstandings" within the documents that would prevent the implementation of environmental measures.

The diagram was then divided into key areas that are interrelated "standards-related measures" , "technical regulations," "relation to other documents that protect and preserve the environment," "Risk assessment and appropriate levels of protection," investment: performance requirements.

It would appear that the NAFTA does have in writing provisions to protect the environment

The NAFTA appears to involve a series of discrepancies

I will attempt to examine the discrepancies within the NAFTA and the interpretation of these discrepancies by the Canadian government in its "Canadian Environmental Review" of NAFTA along with the interpretation, by the Canadian government in the Canada U.S. Free Trade Agreement

## 1. RELATION BETWEEN ENVIRONMENTAL PROVISIONS AND OBJECTIVES

The discrepancy between Environmental provisions which limit economic pursuits in the preamble and economic pursuits in the objectives which ignore the environment

Compare preamble to Objectives

### PREAMBLE

The Government of Canada, the Government of the United Mexican States and the Government of the United States of America, **resolved to:**

STRENGTHEN the special bonds of friendship and cooperation among their nations;

CONTRIBUTE to the harmonious development and expansion of world trade and provide a catalyst to broader international cooperation;

CREATE an expanded and secure market for the goods and services produced in their territories;

REDUCE distortions to trade;

ESTABLISH clear and mutually advantageous rules governing their trade;

ENSURE a predictable commercial framework for business planning and investment;

BUILD on their respective rights and obligations under the *General Agreement on Tariffs and Trade* and other multilateral and bilateral instruments of cooperation;

ENHANCE the competitiveness of their firms in global markets;

FOSTER creativity and innovation, and promote trade in goods and services that are the subject of intellectual property rights;

CREATE new employment opportunities and improve working conditions and living standards in their respective territories;

**UNDERTAKE each of the preceding in a manner consistent with environmental protection and conservation;**

**PRESERVE their flexibility to safeguard the public welfare;**

**PROMOTE sustainable development;**

**STRENGTHEN the development and enforcement of environmental laws and regulations; and**

**PROTECT, enhance and enforce basic workers' rights;**

HAVE AGREED as follows:

**Article 102: Objectives**

1. The objectives of this Agreement, as elaborated more specifically through its principles and rules, including national treatment, most-favored-nation treatment and transparency, are to:

(a) eliminate barriers to trade in, and facilitate the cross-border movement of, goods and services between the territories of the Parties;

(b) promote conditions of fair competition in the free trade area;

(c) increase substantially investment opportunities in the territories of the Parties;

(d) provide adequate and effective protection and enforcement of intellectual property rights in each Party's territory;

(e) create effective procedures for the implementation and application of this Agreement, for its joint administration and for the resolution of disputes; and

(f) establish a framework for further trilateral, regional and multilateral cooperation to expand and enhance the benefits of this Agreement.

2. The Parties shall interpret and apply the provisions of this Agreement in the light of its objectives set out in paragraph 1 and in accordance with applicable rules of international law.

Canadian interpretation of the preamble and objectives  
In the introduction to the Canadian Environmental Review the following statement is made, which suggests that the environmental provisions are part of the objective section of the NAFTA:

Environmental objectives addressed during the negotiations included the identification of sustainable development and environmental protection and conservation **as fundamental objectives of the NAFTA**

In the Canadian Government document, the Canada/ US Free Trade Agreement Synopsis, the Canadian government indicates the important role of the preamble

The preamble states the political commitment ...in entering into the Agreement. It records the shared aspirations of the two countries in concluding the Agreement and summarizes their aims and objectives. In other words, it is an agreed statement of intent which will guide the countries in implementing the provisions of the Agreement and in resolving disputes. ...the object and purpose of the Agreement (13)

**ACTION:** to require that to fully express the intent of the document the government should call for the inclusion of environmental provisions in the Objectives section

## 2.INTERNATIONAL COMMITMENTS AND STANDARDS

There is a discrepancy between the "retention of rights in other documents" (even though NAFTA, in the case of inconsistency unless otherwise indicated, prevails) and the Canadian Government unqualified assertion that Canada has "preserved these rights in agreements"

In Article 103 of NAFTA states that NAFTA shall prevail in the event of an inconsistency between NAFTA and other international agreements (unless otherwise provided)

### Article 103

1. the Parties affirm their existing rights and obligations with respect to each other under the GATT and other agreement to which such Parties are party.

[note exceptions related to the environment in GATT Article XX(b) include environmental measures necessary to protect human, animal or plant life or health, and GATT Article XXg applies to measures relating to the conservation of living and non-living exhaustible natural resources]

2. in the event of any inconsistency between this agreement and such other agreements, this agreement shall prevail to the

extent of the inconsistency, except as otherwise provided in this agreement

However, in Article 903, it would appear that "rights in other documents" are retained:

Article 903 Affirmation of Agreement on Technical Barriers to Trade and Other agreements

Further to Article 103, the Parties affirm with respect to each other their existing rights and obligations relating to standards-related measures under GATT and all other international agreements including environmental and conservation agreements to which those Parties are party.

the Canadian government in its *Canadian Environmental Review* has indicated the following:

During the NAFTA negotiations, all three countries expressed the wish to retain their existing rights and obligations under those multilateral environmental and conservation agreements to which they have chosen to belong. The retention of these right was also assigned a high priority by the Canadian environmental organization in both their written and oral submissions to the government. Canada has preserved these rights in the NAFTA

**ACTION: IT IS IMPORTANT TO DEMAND TO KNOW IF THE RETENTION OF RIGHTS IS NOT INCOMPATIBLE WITH THE NAFTA PREVAILING OVER THE INTERNATIONAL AGREEMENTS NOT SPECIFICALLY MENTIONED.**

[NOTE: it is important to recognize the distinction between "standard" and "technical regulation".

Standard means a document approved by a recognized body that provides for common and repeated use, rules guidelines or characteristics for goods or related processes or production methods or for services or related operating methods, with which compliance is not mandatory.

Whereas, a "technical regulation" means a document which lays down goods or related processes or production methods or for services or related operating methods, including the applicable administrative provisions, with which compliance is mandatory]

### 3. EXTENT TO WHICH INTERNATIONAL AGREEMENTS WILL PREVAIL

There is a discrepancy between the extent to which international agreements prevail as mentioned in the NAFTA and the extent to which the Canadian government indicates these agreements will prevail.

In the NAFTA, the following is stated:

Article 104.1 obligations will prevail in  
convention on International Trade in endangered Species of  
Wild Fauna and Flora ( 1973)  
the Montreal Protocol (1990)  
Basel convention on the Control of trans-boundary Movement of  
Hazardous Wastes and their disposal (1989)  
Annex 104-1 Bilateral and Other Environmental and  
conservation Agreements  
1. The agreement between the Government of Canada and the  
Government of the U.S. concerning the trans-boundary  
Movement of Hazardous Waste, signed at Ottawa, October 18,  
1986  
2. The agreement between the U.S and Mexico on cooperation  
for the Protection and improvement of the Environment in the  
Border Area, 1983.

Article 104.1. (f) Any subsequent international environmental or  
conservation agreement that the Parties agree shall be included,  
the international agreement will prevail

The Canadian government through its Canadian Environmental Review  
indicated:

the prevalence, in the event of inconsistency, of trade  
obligations set out in international environmental and  
conservation agreements over the NAFTA trade disciplines  
(Intro, CER)

In other words these international environmental or conservation  
agreements will take precedence over the NAFTA (CER find  
page ref)

**ACTION: THAT CANADA INSIST IN HAVING ALL THE INTERNATIONAL  
AGREEMENTS RATIFIED BY CANADA INCLUDED IN THIS AGREEMENT  
AND THAT THESE INTERNATIONAL AGREEMENT SHOULD TAKE  
PRECEDENCE OVER THE NAFTA [UNLESS THE ENVIRONMENTAL  
PROVISIONS IN THE NAFTA ARE STRONGER] AS STATED IN THE  
CANADIAN GOVERNMENT'S INTERPRETATION OF NAFTA.  
INTERNATIONAL AGREEMENTS SHALL INCLUDE MORAL  
COMMITMENTS ARISING OUT OF INTERNATIONAL DOCUMENTS SUCH  
AS UN CONVENTION FOR THE PRESERVATION OF CULTURAL AND  
NATURE (1972), AND UNCED DOCUMENTS SUCH AS THE RIO  
DECLARATION AND AGENDA 21 IN WHICH THE GLOBAL COMMUNITY  
AGREED TO FUNDAMENTAL PRINCIPLES SUCH AS THE  
PRECAUTIONARY PRINCIPLE, THE NON-TRANSFERENCE OF HARMFUL  
SUBSTANCES OR ACTIVITIES AND THE REQUIREMENT OF A FULL LIFE  
CYCLE ANALYSIS OF SUBSTANCES AND ACTIVITIES.**

#### 4. STANDARDS-RELATED MEASURES

Discrepancy between "shall work jointly to enhance" and "shall to the greatest extent practicable, make compatible" in the NAFTA, and "forbids downward harmonization," "mandate upward harmonization" in the Canadian government's interpretation of NAFTA

##### Article 906 Compatibility and Equivalence

1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the parties shall, in accordance with this chapter, work jointly to enhance the level of safety and of protection of human, animal and plant life and health, the environment and consumers.

Note "legitimate objectives" have been defined in article 9.5 as

- a) safety
- b) protection of human, animal or plant life or health; the environment or consumers
- c) sustainable development

##### ARTICLE 906 Compatibility and Equivalence

2. Without reducing the level of safety or of protection of human, animal or plant life or health, the environment or consumers, without prejudice to the rights of any Party under this Chapter, and taking into account international standardization activities, the Parties shall to the greatest extent practical, make compatible their respective standards-related measures

In the Canadian Government publication "Canadian Environmental Review" it is stated:

##### Standards enhancement

NAFTA would do more than forbid downward harmonization it obligates parties to work towards upward harmonization (CER, 19)

Environmental objectives addressed during the negotiations included...co-operation, on a continental basis, on the enhancement of environmental standards and their enforcement (Intro, CER)

Significant as it would in effect establish the highest current standards of the three parties (CER, 19)

**ACTION:** to call upon the Canadian government to have incorporated in the NAFTA the "forbidding of downward harmonization" and the "obligating to work towards upward harmonization"

## 5. ALLOCATION OF BURDEN IN RELATION TO STANDARDS

Discrepancy between burden of establishing inconsistency within a chapter as indicated in NAFTA and The placement of the burden of proof in the whole document on the nation challenging an environmental standard of another country as indicated in the Canadian interpretation of the document.

Article 914 Technical consultations

4. The parties confirm that a party asserting that a standards-related measure of another party is inconsistent with this chapter shall have the burden of establishing the inconsistency

The Canadian Government in its Canadian Environmental Review stated:

Environmental objectives addressed during the negotiations included...placement of the burden of proof in a dispute on any nation challenging an environmental standard of another country. (Intro, CER)

and reaffirmed in the body of the text

"Furthermore, should Canada adopt an environmental standard under these international agreement, the burden of proof would be with any country challenging the provision (CER, 14)

It is only on page 22 that the actual text is presented

ACTION: TO ENSURE THAT IN ANY DOCUMENT RELATED TO THE ENVIRONMENT, THE BURDEN OF PROOF SHOULD LIE NOT ONLY ON THE COUNTRY THAT OBJECTS TO THE HIGHER STANDARD BUT ALSO TO THE INDUSTRY THAT SEEKS TO INTRUDE INTO THE ECOLOGICAL COMMONS

## 6. RELATION BETWEEN ACTION OF ENVIRONMENTAL MEASURES AND INVESTMENT

The discrepancy between "recognizing inappropriateness" **should not waive** "**may request consultations**" as indicated in the NAFTA and "a commitment to refrain" in the Canadian government's analysis of the document

In the NAFTA Article 1114 (2) discourages the relaxing of environmental measures

In Article 1114 (2), Environmental Measures, the NAFTA states: The Parties recognize that it is **inappropriate to encourage** investment by relaxing domestic health, safety or environmental measures. Accordingly, a **Party should not waive** or otherwise derogate from, or offer to waive or otherwise derogate from, such measures as an encouragement for the establishment, acquisition, expansion or retention in its territory of an investment of an investor. If a Party considers that another

Party has offered such an encouragement, it **may request consultations** with the other Party and the two Parties shall consult with a view to avoiding any such encouragement

In the Intro of the Canadian Governments, "Canadian Environment Review", the environmental objectives is presented as being "a commitment to refrain"

Environmental objectives addressed during the negotiations included acceptance of a commitment that government refrain from offering derogation from generally applicable environmental measures for the purpose of encouraging an investment

**ACTION : CALL UPON THE CANADIAN GOVERNMENT TO DEMONSTRATE TRUE COMMITMENT BY CHANGING "SHOULD" TO "SHALL"**

Because of all these potential discrepancies between the NAFTA and the Canadian Governments interpretation of NAFTA, I would like to make the following recommendation

**RECOMMENDATION:**

**GIVEN:**

**EITHER THE GOVERNMENT OF CANADA HAS MISINTERPRETED OR MISREPRESENTED ENVIRONMENTAL SECTIONS IN NAFTA, IN THEIR OCTOBER, 1992 ENVIRONMENTAL REVIEW, OR THE NAFTA HAS CHANGED AND IN THAT CASE IT WOULD BE NECESSARY TO HAVE ANOTHER ENVIRONMENTAL ASSESSMENT REVIEW OF THE ENVIRONMENTAL IMPLICATIONS OF NAFTA**

**THE CANADIAN GOVERNMENT NOT RATIFY THE DOCUMENT UNTIL THE STRONGER INTERPRETATION THAT HAS BEEN PRESENTED TO THE CANADIAN PUBLIC THROUGH THE GOVERNMENT INTERPRETATION OF THE DOCUMENT BECOME AN INTEGRAL PART OF THE ACTUAL DOCUMENT**

**THE CANADIAN GOVERNMENT NOT RATIFY THE DOCUMENT BECAUSE IT FALLS SHORT OF THE CANADIAN GOVERNMENT'S INTERPRETATION OF THE DOCUMENT.**

( ) THAT IN 1992, I prepared for a presentation at a Post-UNCED workshop organized by the United Nations Association of Victoria, July, 1992

**For a presentation for the AGM of United Nations Association of Victoria I did a content analysis of the IAEA Documents at UNCED to**

accompany" **Seductive devices, doctrines, dogmas, strategies and fallacies of the IAEA by Dr Fred Knelman and Joan Russow**

- **The "blatant misrepresentation or expedient omission" device**

This device involves the convenient exclusion of any part that could be detrimental to one's position.

The IAEA through expedient omission (possibly for advantageous "clarification") has left out a significant section in Agenda 21 which does not include nuclear energy in the list of "safe" technologies for the future. To "clarify" Agenda 21, the IAEA in its UNCED document stated the following:

The UNCED Agenda 21 notes the need for a transition to environmentally sound energy systems, which will entail major changes in the patterns of energy production and consumption (IAEA Document, p.5, 1992)

In the Atmosphere chapter of Agenda 21, the following [safe] and sound technologies are advocated:

"...cooperate to increase the availability of capacity, capabilities and relevant technologies ...for utilizing and producing environmentally [safe and] sound renewable energy resources, such as solar, wind, geothermal, hydro-power and biomass,... Each resource should be utilized in a manner that ... minimizes environmental stress and health impacts, .... " (Section 9. Subsection 9 g Agenda 21, 1992)

Thus, we see that in the Energy section of Agenda 21, Nuclear energy is not mentioned as being one of the [safe] or sound technology.

- **The "co-opted terms" strategy**

This strategy involves the stipulating of a new definition for a term that would jeopardize one's own argument.

In the Rio Declaration the following precautionary principle was advocated:

"Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." ( Rio Declaration, 1992).

In the following statement, the IAEA redefines the important precautionary principle that was agreed to in the Rio Declaration, 1992.

“The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary” (IAEA Document , p. 2, authors emphasis)

The Rio principle, however, if enacted and truly adhered to, would bring about a moratorium on new nuclear power plants while phasing out currently existing ones.

- **The "comparison of convenience" device**

This device involves the narrowing down of alternatives so that whatever aspect is compared will appear favourable to the proposed alternative.

In the following statement from the IAEA document, the IAEA narrows the alternatives used for comparison to those which would appear to be favourable within the terms of reference of their comparison. Thus, for example, they compare the relatively low volume of nuclear wastes to the much larger volume of wastes from fossil fuels. However, it is the volume of wastes multiplied by their toxicity that is significant. Merely comparing volumes is a "comparison of convenience." The same false comparison is used to compare fuel requirements for the same energy output.

“A nuclear plant would require 27 tonnes of slightly enriched uranium each year, which corresponds to a few truckloads. The corresponding quantity of natural uranium is 160 tonnes. a coal fired plant would need 2.6 million tonnes of coal each year... which corresponds to the load carried by 5 trains, each transporting 1400 tones every day an oil fired plant would require 2 million tonnes of fuel oil per year, which is about 10 supertanker loads.” (IAEA document, 1992, p.12)

The nuclear establishment never fails to compare coal and nuclear as competing energy sources, always claiming the inherent superiority of nuclear . Usually this is accomplished by failing to include the entire fuel cycle over its full life of impacts, social and environmental. They conveniently exclude "safety" factors," "production of wastes," "disposability of wastes," "degree of potential for bioaccumulation,;" lifetimes of wastes, toxicity and proliferation problems associated with nuclear wastes.

“Yet no bombs are built of coal, no terrorist is interested in hijacking coal or in the clandestine acquisition of coal weapons, coal plants do not have to be decommissioned and mothballed after some 30 to 50 years of operation, their hazardous wastes do not have to be guarded for 100,000 years, coal dust is easier to contain than radon and coal plants do not require liability subsidies by acts of parliament” ( Knelman, 1992)

- **The "lull and lure of the technological fix" syndrome**

**( the "misleading assurance" device or the fallacy of "technological omnipotence")**

This syndrome, device or fallacy involves the revealing of the seriousness of the problem and the offering of a "solution" which is usually worse than the problem

The proponents of a potentially dangerous act indicate that they recognize the danger and focus on one area for which they can offer a technological fix

In the following statement from the Radioactive Wastes section of Agenda 21, into which it appears that the IAEA had input, the following situation is recognized:

“Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste ( as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. The high level waste contains about 99 percent of the radionuclides and thus represents the largest radiological risk.” ( Agenda 21, Radio Active wastes, 21.1.).

In the IAEA document the authors affirm the certainty of the technological fix.

“There is nevertheless a consensus among experts that safe geological disposal of high level wastes, including spent nuclear fuel, is technically feasible.” ( IAEA Document, p.17)

The view of experts in the field is that safe technological solutions exist for managing the waste. (IAEA Document, 1992, p. 15)

Knelman (1992) points out that:

“The assumption behind the notion of permanent disposal of High level wastes deep in a stable geological formation is false because this assumption relies on the mistaken belief that anything we do technologically can be permanent This assumption of permanence is particularly false when we are dealing with the lithosphere over some 100,000 years and when we must first disturb the geological structure by digging a very deep hole. AECL(Atomic Energy of Canada Limited) has dug a deep hole near Lac du Bonnet in Manitoba which is totally inappropriate for such so-called "permanent" disposal. For one thing you must, in all events, avoid water. Yet, The AECL hole must be soaked Walt Patterson, a nuclear critic described this AECL research as follows: A drunk has lost his keys and is discovered by a police officer crawling around a street light. When questioned, the drunk admitted that he had lost his keys in front of a dark building, a block away. When asked why the

drunk was then searching around the street light, the drunk said " you see, officer, the light is better here" and as Dr Martin Resnikoff, an expert on geological waste disposal has put it " the earth does not stand still. In other words, experts in the relevant fields do not agree." (Knelman, 1992, in progress)

- **The "rhetoric of notwithstanding clause" doctrine.**

This doctrine allows for the indulging in strong statements about deep concern and the need for significant change and then including a notwithstanding clause that negates the strong statement.

In the Rio declaration (1992) there is a strong statement about third world dumping:

“States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health. (Principle 14 Rio Declaration,” (1992)

There are, however, disturbing "notwithstanding clauses" that appear such as in the following statements:

“Develop regulatory and non-regulatory measures and procedures aimed at preventing the export of chemicals that are banned, severely restricted, withdrawn or not approved for health or environmental reasons, *except when such export has received prior written consent from the importing country or is otherwise in accordance with the PIC procedure*; ( Section 19. subsection 53” , (Agenda 21, 1992)

In the following statement in the IAEA document, the IAEA energetically adopts the spirit of the " rhetoric of notwithstanding clauses"

“The IAEA in 1990 promulgated a Code of Practice on the International Trans-boundary Movement of Radioactive Waste as a basis for harmonization of national legislation and policies. The code lays down the conditions and principles for international waste transfers, such as that movement must be made in a manner consistent with the international safety standards, that there must be prior notification and consent of the sending, receiving and transit States, and that each State involved should have a regulatory authority...”( IAEA Document, 1992, p. 20

- **The "flamboyant absurdity" doctrine or dogma**

This doctrine or dogma carries the concerns of one's opponents to the point where the regulations governing the opponents concerns should become the standard by which other potentially lesser concerns will be addressed.

The IAEA appears to advocate that, what is considered to be the most dangerous industry, just because it is dangerous, has developed stringent standards, and that they who contribute to possibly the greatest uncontrollable hazard are the ones who should assist the community in dealing with other hazards.

“The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary and are so well founded in science and so widely accepted that they are now also being regarded as a source of guidance in controlling pollutants and impacts arising from other human activities. Their wider application would undoubtedly contribute towards sustainable development.” (p.2)

• **The "justification through dire consequences of alternatives" device**

This device involves the revealing of the dire consequences of the current practices and offering one own practice as the salvation for the problem

In the following statement the IAEA cites the dire consequences of the other alternatives to justify their proposed alternative:

“The problem of acid rain, which is linked to emissions from the burning of fossil fuels, has been recognized for decades..... the primary concern about the continued and increasing use of fossil fuels is the problem of CO<sub>2</sub> emission and the potential impact on world climate..... World conference on the Changing Atmosphere... need to reduce CO<sub>2</sub> emission (IAEA document, p. 5)  
climate change in connection with fossil fuels” (p. 9)

• **The "benevolent outcome exploitation" strategy**

This strategy involves the selection of the outcome which the opposition to the proposed alternative would advocate and the subsequent attempt to demonstrate that the proposed alternative, which the opposition would condemn, would be the best way of achieving that outcome.

In the following statements from the IAEA document, the IAEA focuses on the desired outcomes of reducing acid rain and limiting greenhouse gas to justify the selection of their proposed alternative:

“Several governments have already made commitments to reduce carbon emission, while recognizing that this will be hard to achieve except through drastic policy decisions in the energy sector.” (IAEA Document, 1992, p.6)

“Nuclear power plants in normal operations cause very little environmental detriment and are beneficial when they replace plants which would emit CO<sub>2</sub>, SO<sub>2</sub>, and NO<sub>2</sub> (p. 12). In this respect they would help to reduce acid rain and limit greenhouse gas emissions” (IAEA Document 1992 , p. 12)

To accomplish the above, IAEA and other nuclear proponents are recommending the construction of some 4000 to 5000 new commercial nuclear power plants. The combination of the multi- trillion cost and the time required for construction renders this proposal no less than bewildering. By the 6 to 10 year period required for construction, other sources of climate-altering gases would wipe out all gains. Secondly at 1/7th to 1/10th the above cost, a much greater reduction in CO<sub>2</sub> and other climate-altering gases can be achieved through simple available conservation and efficiency measures.

• **The "flaunting and condoning of the vicious circle principle" strategy**

This strategy is best explained by the economic principle that "bad money drives out good." is The opportunity costs of nuclear power are unacceptable and prohibitive. Thus, the money spent to subsidize nuclear power is at the expense of the funds required to solve the energy problem with safe alternatives, and consequently, because the research into alternatives will not be effectively carried out, the safe alternatives will not be able to adequately replace the non-renewable forms of energy.

“In the 1992 report to UNCED, following was stated:  
Nuclear energy has safety risks associated with the entire uranium cycle, from mining through processing to the ultimate disposal of high-level radioactive wastes. In addition, there are safety risks associated with the reactors used to generate electricity from uranium . And the use of fossil fuel to drive conventional thermal generation produces carbon dioxide and waste heat. (Canada's National report UNCED p. 46- 47)  
From a domestic consumption point of view, the least environmentally damaging energy option is energy efficiency.”  
(Canada's National report UNCED p. 47)

Despite the above statement, the document concludes::

“New, cleaner technologies such as solar energy may help, but the hard fact is that to a large extent we will have to rely on either thermal, hydro, or nuclear energy in the future. In addition, energy projects for both export and domestic supply provide jobs and economic wealth to the country, and are especially

important in some regions of Canada" ( p. 47. Canada's National report UNCED June, 1992, authors' emphasis)

The Canadian government has invoked the "vicious circle principle" by cutting subsidies to conservation efficiency and renewals. Canada is thus playing an important role in facilitating this not too hidden agenda by using many strategies, devices, doctrines, etc.

### **CONCLUSION:**

The " nukespeak" and the seductive devices, strategies, syndromes used by the Nuclear Industry involve the language of delusion and distortion. Hopefully, through the continued revealing and categorizing of these words of delusion we could, in some small way, counteract the impact of the not too-hidden-agenda of the IAEA, and the rest of the nuclear establishment and their government supporters.

( ) THAT IN 1992 Prior to UNCED  
I worked on an Earth Charter

### EXHIBIT

( ) THAT in June 1992, I drafted an alternative composite Earth Charter

### EXHIBIT

#### 1992 EARTH CHARTER

to enshrine the following individual ecological rights

- the right to a safe ecosystem
- the right to expect that the government will foster and encourage the moral and ethical responsibilities concomitant with the protection of the right to a safe ecosystem and to an ecological heritage
- the right to require the disallowing of acts that could contribute to ecological irreversibility
- the right to demand that the government take immediate actions to address the urgent potentially irreversible environmental situation even though the action may interfere with the pursuit of short-term economic privileges
- the right to prevent the government or industry from satisfying short term economic wishes that would compromise the satisfaction of long-term ecological needs of future generations
- the right to expect the government not to abandon high national environmental standards to comply with international economic agreements
- the right to have the government give the environment, primacy in decision making

- the right to require governments to approach the ecosystem as the interdependence of principles that need to be in place if there is to be a solution (unacceptability of "short term" solutions based on fragmentation of the problem)
- the right to demand the preservation of significant ecosystems and that significant is not dependent on the notion of "collectibles" i.e., that if there is already an ecosystem preserved in one district would prevent a similar ecosystem from being protected in another district.
- the right to demand the reduction and elimination of destruction of the habitat by ecologically unsound economic practices
- the right to demand that restrictions be placed on aesthetic or medicinal uses of fauna that could lead to species impoverishment
- the right to demand the government to suspend any activity by Multinational Corporations that could cause environmental degradation through ecologically unsound practices.
- the right to demand national control over the safety of products and over national standards related to ecologically sound practices in accordance with proposed international standards.
- the right to demand that if a product or an activity is engaged in as a result of the falsification of data, or inadequate non-arm's length research that that product should be immediately taken off the market and the activity should be suspended
- the right to demand the government to condemn and disallow the exporting of products or services that are deemed to be unsafe in a country where there may be high restrictions or regulations to other countries with more relaxed regulations (because of their inability to test these products and because of their economic need prevents them from paying for more expensive and safer substitutes)
- the right to demand that "caution should be exercised when there is doubt about the impact of development
- the right to demand that ecologically sound principles drive industry not industry driving principles
- the right to have the onus of proof shifted from those opposing the intervention "having to demonstrate that the intervention will cause harm" to those advocating the intervention "having to demonstrate that their intervention will not cause harm.
- the right to ensure that remuneration should only be paid for work that is ethical (i.e., that it does not contribute to ecological irreversibility or ecological privation)
- the right to demand the government to assess the full environmental impact of any intervention that may cause environmental harm to the ecosystem
- the right to demand the government to resist the temptation of accepting non-ecologically sound projects because funds from these projects could be allocated for humanitarian projects (including job creation)
- the right of public to full disclosure about ecological consequences of an intervention
- the right of the public to have input into the decision-making process at the time of meaningful alternatives: a) at the time of formulation of the terms of reference and at the time when a decision is made about an environmental assessment review is to be made; b) continually throughout the proposed

- project; c) at any time where there is significant public concern about the environmental impact of the project
- the right to require the government to disallow the rationalizing away of potentially harmful impact on the ecosystem through the guise of altruism or necessity
  - the right to require the government to disallow projects where accidents, though unlikely, could be so disastrous that irreversible harm would occur to the environment.
  - the right to require the government to prohibit the production of weapons of mass destruction and work towards the control over other weapons and towards eventual disarmament.
  - the right to demand the government to reduce and eliminate use of harmful pesticides
  - the right to require the government to disallow acts contributing to ecological irreversibility in all lands including those of private ownership and those whose ownership is under dispute

## **EARTH CHARTER**

*We are the Earth, the people, plants and animals; the rains and the oceans; the breath of the forests and the life of the sea*

All life is interconnected and interdependent in ways that will never be fully understood through science

In our quest to see ourselves as separate and even above the web of life we have imperiled the delicate balance

We have contaminated the air, water and soil and driven wild things to extinction, dammed rivers, torn down ancient forests, poisoned the rains and ripped holes in the sky

We have come to realize that the traditional consumptive patterns of development have contributed to poverty, to the inequitable distribution of resources, to over-consumption, to the violation of human rights and to the potentially irreversible degradation of the ecosystem

We have come to realize that the threats to the biosphere which sustains all life on this planet have increased in rate, magnitude and scale that inaction is negligent. The international community has enough information about the pending state of ecological irreversibility that it must act immediately.

**WE DECLARE THE FOLLOWING PRINCIPLES TO GUIDE HUMANITY TO AN EQUITABLE AND ECOLOGICALLY SOUND FUTURE**

- The ecosystem of which we are a part shall be protected and preserved; ecologically unsound patterns of development shall be condemned and the inequity of development must be addressed and rectified. The mandate to limit growth must prevail

- The precautionary principles shall be extended to require those who wish to intervene in the ecological commons to have to justify their intervention and demonstrate the safety of their intervention. The full environmental costs shall be considered in any proposed development project that may cause ecological harm
- Development activities that benefit the few while compromising the biological inheritance, and quality of life of the many must be condemned as being inherently and ethically wrong
- Most of the third world debt was accumulated as a result of development that was inequitable and detrimental to the ecosystem; remedial and restorative measures shall be undertaken to address the inequity and ecological harm. The third world debt shall be forgiven and redirected for the purpose of addressing inequity and of restoring the ecosystem. While all are responsible for improving environmental quality, those who disproportionately consume the majority of the Earth's resources and pollute the natural environment shall bear the bulk of the costs of ecological restoration and protection.
- States shall not have the sovereign right to exploit resources within their territories. All actions within states must comply with high international ecological standards
- International ecological standards shall be in place so that no short-term individual pursuit of self-interest, or short sighted national or international regulations (GATT) could jeopardize the environment. The purpose of these standards is to address the individual and multinational pursuit of self-interest and to prevent the consumption and exploitative use of the environment and not to penalize local communities that wish to function in an interdependent way with the ecosystem. The economic development necessary to eliminate poverty shall not be a mandate to abuse the environment for either short-term gain or economic growth.
- The international community shall condemn and shall disallow the exporting of products deemed to be unsafe in a state where there are advanced testing procedures to other states with less advanced testing procedures. No products or activities shall be transferred to other states if their transfer could cause harm to health or to the ecosystem.
- The continued build-up of the military complex must cease, and the use of military forces as a means of resolving conflict must be rejected. A radical reduction of the military budgets of the world must occur, and the funds released for ecological and humanitarian purposes. The decision-making process shall be clearly defined, transparent, accessible and equitable. Criteria in decision making shall be revealed, and the public and affected communities should be involved at the time of formulation of the terms of reference and throughout the process
- Behaviour and attitudes rather than countries should be categorized as "developed, " "developing" or "underdeveloped." The contribution of those people who have been "truly developed" in that they have succeeded in living in interdependence with the ecosystem shall be recognized and their advice sought

## **Composite Earth Charter**

## **COMPOSITE EARTH CHARTER**

**EARTH CHARTER (NGO) AND RIO DECLARATION and **Alternate Earth Charter****

### **Preamble**

We are the Earth, the people, plants and animals; the rains and the oceans; the breath of the forests and the life of the sea (NGO Charter)

*All life is interconnected and interdependent in ways that will never be fully understood through science*

*In our quest to see ourselves as separate and even above the web of life we have imperiled the delicate balance*

*We have contaminated the air, water and soil and driven wild things to extinction, dammed rivers, torn down ancient forests, poisoned the rains and ripped holes in the sky (charter of Interdependence, Suzuki)*

**We have come to realize that the traditional consumptive patterns of development have contributed to poverty, to the inequitable distribution of resources, to over-consumption, to the violation of human rights and to the potentially irreversible degradation of the ecosystem**

**We have come to realize that the threats to the biosphere which sustains all life on this planet have increased in rate, magnitude and scale that inaction is negligent. The international community has enough information about the pending state of ecological irreversibility that it must act immediately.**

## Principles

1.

**The Earth's ecosystem shall be conserved, protected and restored** [We agree to respect, encourage, protect and restore Earth's ecosystems to ensure biological and cultural diversity]

States shall cooperate in a spirit of global partnership to conserve, protect and restore the health and integrity of the Earth's ecosystem. (Principle 6)

**The ecosystem of which we are a part shall be protected and preserved; ecologically unsound patterns of development shall be condemned and the inequity of development must be addressed and rectified. The mandate to limit growth must prevail**

**the right to expect that the government will foster and encourage the moral and ethical responsibilities concomitant with the protection of the right to a safe ecosystem and to an ecological heritage**

- **the right to require the disallowing of acts that could contribute to ecological irreversibility**
- **the right to demand that the government take immediate actions to address the urgent potentially irreversible environmental situation even though the action may interfere with the pursuit of short-term economic privileges**
- **the right to require governments to approach the ecosystem as the interdependence of principles that need to be in place if there is to be a solution (unacceptability of "short term" solutions based on fragmentation of the problem)**
- **the right to demand the preservation of significant ecosystems and that significant is not dependent on the notion of "collectibles" i.e., that if there is already an ecosystem preserved in one district would prevent a similar ecosystem from being protected in another district.**
- **the right to demand the reduction and elimination of destruction of the habitat by ecologically unsound economic practices**

2.

**We recognize our diversity and our common partnership. We respect all cultures and**

**[affirm the rights of all people to basic environmental needs]**

**The rights of all to a safe environment shall be enshrined and enforced internationally, nationally, and locally in legislation, and**

3.

Poverty affects us all.

All states and all people shall cooperate in the essential task of eradicating poverty as an indispensable requirement for [sustainable development], in order to decrease the disparities in standards of living and better meet the needs of the majority of the people of the world.

[We agree to alter [unsustainable] patterns of production and consumption to ensure the eradication of poverty and to end the abuse of Earth.] **The fundamental principle which calls for limiting growth shall be internationally adhered to. Current patterns of overconsumption shall be reduced and eventually eliminated, and efforts shall be made to stabilize population**

To achieve sustainable development and a higher quality of life for all people, states should shall reduce and eliminate unsustainable patterns of production and consumption (Principle 8)

**Development activities that benefit the few while compromising the biological inheritance, and quality of life of the many must be condemned as being inherently and ethically wrong**

This must include a recognition of the role of debt and financial flows from the South to the North

**The third world debt shall be forgiven and these additional funds shall be transferred to ecologically sound, humanitarian project.**

and opulence and corruption as primary causes. We shall emphasize and improve the endogenous capacity for technology creation and development. States should cooperate to strengthen endogenous capacity-building for sustainable development by improving scientific understanding through exchanges of scientific and technological knowledge, and by enhancing the development, adaptation, diffusion and transfer of [ecologically sound non obsolete] technologies, including new and innovative technologies. (Principle 9)

Attempts to eradicate poverty should not be a mandate to abuse the environment and attempts to protect or restore the environment should not ignore basic human needs

4.

**States shall not have the sovereign right to exploit resources within their territories. All actions within states must comply with high international ecological standards**

We recognize that national barriers do not generally conform to Earth's ecological realities. National sovereignty does not mean sanctuary from our collective responsibility to protect and restore Earth's ecosystems.

States have ...the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other states or of areas beyond the limits of national jurisdiction (principle 1)

Trade practices and transnational corporations must not cause environmental degradation and should **[shall] be** controlled in order to achieve social justice, equitable trade and [solidarity] with ecological principles.

**International ecological standards shall be in place so that no short-term individual pursuit of self-interest, or short sighted national or international regulations (GATT) could jeopardize the environment. The purpose of these standards is to address the individual and multinational pursuit of self-interest and to prevent the consumption and exploitative use of the environment and not to penalize local communities that wish to function in an interdependent way with the ecosystem. The economic development necessary to eliminate poverty shall not be a mandate to abuse the environment for either short-term gain or economic growth.**

**the right to prevent the government or industry from satisfying short term economic wishes that would compromise the satisfaction of long-term ecological needs of future generations**

- **the right to expect the government not to abandon high national environmental standards to comply with international economic agreements**
- **the right to have the government give the environment, primacy in decision making**

5

we [reject] **Governments must cease the buildup of military force** [the buildup] and use of military force and the use of economic pressure as means of resolving conflict.

- **the right to require the government to prohibit the production of weapons of mass destruction and work towards the control over other weapons and towards eventual disarmament.**

States shall resolve all their environmental disputes peacefully and by appropriate means in accordance with the Charter of the United Nations. (Principle 26)

We commit ourselves to pursue genuine peace, which is not merely the absence of war but includes the eradication of poverty, the promotion of social justice, **human and social rights** and [economic], spiritual, cultural and ecological well-being.

Peace, development and environmental protection are interdependent and indivisible (principle 25)

Warfare is inherently destructive of sustainable development. States shall therefore respect international law providing protection for the environment in times of armed conflict and cooperate in its further development, as necessary. (Principle 24)

**The continued build-up of the military complex must cease, and the use of military forces as a means of resolving conflict must be rejected. A radical reduction of the military budgets of the world must occur, and the funds released for ecological and humanitarian purposes.**

6.

We agree to ensure that decision-making processes and their criteria are clearly defined, transparent, explicit, accessible and equitable.

**the right of the public to have input into the decision-making process at the time of meaningful alternatives: a) at the time of formulation of the terms of reference and at the time when a decision is made about an environmental assessment review is to be made; b) continually throughout the proposed project; c) at any time where there is significant public concern about the environmental impact of the project**

Environmental issues are best handled with the participation of all concerned citizens, at the relevant level. At the national level, each individual shall have appropriate access to information concerning the environment that is held by public authorities, including information on hazardous materials and activities in their communities, and the opportunity to participate in decision-making processes. States shall facilitate and encourage public awareness and participation by making information widely available. (Principle 10)  
Effective access to judicial and administrative proceedings, including redress and remedy shall be provided. (Principle 10)

In order to achieve sustainable development, environmental protection shall constitute an integral part of the development process and cannot be considered in isolation from it (Principle 4)

Those whose decisions or activities may affect the environment must first prove the absence of harm.

**the right to have the onus of proof shifted from those opposing the intervention "having to demonstrate that the intervention will cause harm" to those advocating the intervention "having to demonstrate that their intervention will not cause harm.**

**the right to demand that "caution should be exercised when there is doubt about the impact of development**

In order to protect the environment, the precautionary approach shall be widely applied by States [according to their capabilities]. Where there are threats of serious or irreversible damage [where there may be adverse environmental effects), lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation. (Principle 15) **The precautionary principles shall be extended to require those who wish to intervene in the ecological commons to have to justify their intervention and demonstrate the safety of their intervention. The full environmental costs shall be considered in any proposed development project that may cause ecological harm**

Environmental impact assessment, as a national instrument, shall be undertaken for proposed activities [that may] that are likely to have a significant adverse impact on the environment [and are subject to a decision of a competent national authority]. Significant adverse impact shall be

**determined by reference to international ecological standards (principle 17)**

• Those likely to be affected, particularly populations in the South and those in subjugation within existing States, should have free access to information and effectively participate in the decision-making processes.

The special situation and needs of developing countries, particularly the least developed and those most environmentally vulnerable, shall be given special priority. International actions in the field of environment and development should also address the interests and needs of all countries (Principle 6)

7

States, institutions, corporations and peoples are unequal in their contribution to environmental harm, experience of ecological degradation and ability to respond to environmental destruction. While all are responsible for improving environmental quality, those who have expropriated or consumed the majority of Earth's resources or who continue to do so must cease such expropriation or reduce such consumption and must bear the costs of ecological restoration and protection by providing the majority of financial and technological resources.

The developed countries acknowledge the responsibility that they bear in the international pursuit of sustainable development in view of the pressures their societies place on the global environmental and of the technologies and financial resources they command (principle 7)

8.

Women constitute over half of Earth's human population. They are a powerful source for change. They contribute more than half the effort to human welfare. Men and women agree that women's status in decision-making and social processes must equitably reflect their contribution. We must shift from a society dominated by men to one which more accurately reflects the valued contributions of men and women to human and ecological welfare.

Women have a vital role in environmental management and development. Their full participation is therefore essential to achieve sustainable development (Principle 20)

22

Indigenous people and their communities, and other local communities, have a vital role in environmental management and development because of their knowledge and traditional practices. States should recognize and duly support their identify, culture and interests and enable their effective participation in the achievement of sustainable development. (Principle 22)

We recognize the special place of Earth's Indigenous Peoples, their territories, their customs and their unique relationship to Earth. (Preamble). **Indigenous peoples shall be given the right to self-government, and all states shall settle indigenous peoples land rights**

• the right to demand that restrictions be placed on aesthetic or medicinal uses of fauna that could lead to species impoverishment

- the right to demand the government to suspend any activity by Multinational Corporations that could cause environmental degradation through ecologically unsound practices. •

11

**the right to demand national control over the safety of products and over national standards related to ecologically sound practices in accordance with proposed international standards.**

States shall enact effective environmental legislation. Environmental standards, and priorities should reflect the environmental and developmental context to which they apply. (Principle 11) **International ecological standards shall be established as a basis for national and local standards.**

13

States shall develop national law regarding liability and compensation for the victims of pollution and other environmental damage. States shall also cooperate in an expeditious and more determined manner to develop further international law regarding liability and compensation for adverse effects of environmental damage caused by activities within their jurisdiction or control to areas beyond their jurisdiction (Principle 13)

14

States should (shall) effectively cooperate to discourage or prevent the relocation and transfer to other states of any activities and substances that cause severe environmental degradation or are found to be harmful to human health

**the right to demand the government to condemn and disallow the exporting of products or services that are deemed to be unsafe in a country where there may be high restrictions or regulations to other countries with more relaxed regulations (because of their inability to test these products and because of their economic need prevents them from paying for more expensive and safer substitutes)**

**the right to demand that if a product or an activity is engaged in as a result of the falsification of data, or inadequate non-arm's length research that that product should be immediately taken off the market and the activity should be suspended**

16

National authorities should [shall] endeavour to promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should[shall] in principle, bear the cost of pollution, with due regard to the public interest [and without distorting international trade and investment] (Principle 16)

18

States shall immediately notify other States of any natural disasters or other emergencies that are likely to produce sudden harmful effects on the environment of those States. Every effort shall be made by the international community to help States so afflicted (principle 18)

**States shall be obliged to refrain from any activity that could potentially cause environmental harm**

States shall provide prior and timely notification and relevant information to potentially affected States on activities that may have a significant adverse trans-boundary environmental effect and shall consult with those States at an early stage and in good faith. (Principle 19)

21

The creativity, ideals and courage of the youth of the world should be mobilized to forge a global partnership in order to achieve sustainable development and ensure a better future for all. Principle 21)

Principle 23

The environmental and natural resources of people under oppression, domination and occupation shall be protected

**• the right to demand that ecologically sound principles drive industry not industry driving principles**

**Behaviour and attitudes rather than countries should be categorized as "developed, " "developing" or "underdeveloped," The contribution of those people who have been 'truly developed" in that they have succeeded in living in interdependence with the ecosystem shall be recognized and their advice sought**

**• the right to demand the government to reduce and eliminate use of harmful pesticides**

**• the right to require the government to disallow acts contributing to ecological irreversibility in all lands including those of private ownership and those whose ownership is under dispute**

( ) THAT in July, 1992, I performed a content analysis of the almost 800-page Agenda 21 that was agreed to at UNCED and sent the content analysis to Noel Brown the Secretary General of UNEP

## EXHIBIT

### **A VERY PRELIMINARY CONTENT ANALYSIS OF THE RIO DECLARATION AND OF SECTIONS 1-22 OF AGENDA 21 AND (JUNE 30, 1992) AND EXTRACTION OF PRINCIPLES OF ACTION**

**Note 1** I brought home the 800 page document and did a content analysis of the documents: **Note 2.** this content analysis was done on the documents that were distributed at Rio prior to the resolution of the bracketed sections. When a section was in brackets, which indicates that a section is still under discussion, the brackets will be indicated. The categories used in the content analysis reflect significant aspects of the global environmental situation. The statements selected under each category were selected because they were assessed to be ones that ,if implemented, would bring about the needed changes . All the statements in Agenda 21 and the Rio Declaration were adopted by consensus by the member states of the United Nations at UNCED. More analysis has to be done particularly for issues that pertain specifically to the "developing" countries.

**Note:** Phrases in italics are those that appear to weaken the statements

<b>PART 2: EXTRACTION OF PRINCIPLES OF ACTION FROM INTERNATIONAL DOCUMENTS PARTICULARLY AGENDA 21</b>	<b>42</b>	

## 1. INTRODUCTION

Although there were systemic constraints which prevented UNCED from addressing the urgency of the global situation, there were many significant acknowledgments and principles which emerged from UNCED.

### systemic Constraints preventing change

The following "systemic constraints," appear to have prevented the global community from addressing the urgency:

- the continued willingness to enshrine the sovereign right to exploit natural resources.
- the unwillingness to move beyond sovereign barriers to international environmental governance
- the failure to recognize that the situation is so urgent that international environmental governance and standards have to be necessary
- the refusal of states to accept the rule of international law
- the reluctance to establish stringent international environmental standards and technological regulations
- the unwillingness of states to allow for a stringent monitoring program
- the reluctance to recognize that the urgency of the current global situation requires the summoning up of the international political will to move from "should" to "shall"
- the obsession with consensus which may lead to the lowest common denominator rather than striving through collaboration for the highest tenable principles
- the decision making process being conceived as an arena of competing interests
- the designation of failure made by those states, institutions and individuals who do not even live up to the moderate principles established by consensus
- the reluctance to redefine what constitutes development in an ecologically sound way
- the revelation of a problem and the presentation of a solution which could have more disastrous or equally disastrous consequences as the problem ( nuclear)
- the continued justification and rationalization about the use of ecologically unsound practices in the guise of technological fixes
- the condoning of technological fixes suggested as solutions:
- the continued condoning of research and development into rectifying the harm done through ecologically unsound practices rather than discontinuing ecologically unsound practices( the Green Revolution syndrome)
- the presence and use of international short term economic regulations which justify the abandoning by sovereign states of high ecological standards. ( present in GATT regulations, and evident in Chapter 2 of Agenda 21 "Social and Economic Dimensions.")
- the reluctance of GATT to consider the applicability of any chapters other than Chapter 2
- the persistence of the situation whereby the power to prevent environmental harm or to preserve environmental heritage resides in

those whose interest it is to benefit economically from the environment. and that in whose interest it is to benefit economically from the environment tend to ignore ecologically sound practices

- the persistence of the co-option, often through government funding, of groups, whose role should be to act as the conscience of the official decision makers
- the persistence of the situation where those who should be speaking out are constrained because of professional commitments, and where those who are willing to speak out are not heard because the press fails to report their statements
- the sanctioned use of "words of delusion" that either delude the public into thinking that what is unsafe, is safe, or delude the public into thinking that there is the political will to eliminate unsafe practices.
- the sanctioned use of loophole vague terms like "as appropriate" or of loophole provisions like *without prejudice to international trade principles*. For example in the following section on consumption They should therefore review the purchasing policies of their agencies and departments so that they may improve, where possible, the environmental content of government procurement policies, *without prejudice to international trade principles*. ( 4.23, Consumption)
- the sanctioned use of the "notwithstanding clause" device. This device allows for the indulging in strong statements about deep concern and the need for significant change and then including a notwithstanding clause that negates the strong statement.

" Implement, as a matter of urgency, *in accordance with country-specific conditions and legal systems*, measures to ensure that women and men have the same right to decide freely and responsibly on the number and spacing of their children and have access to the information, education and means, as appropriate, to enable them to exercise this right *in keeping with their freedom, dignity and personally held values, taking into account ethical and cultural considerations*. (3..8 j Combating Poverty)

- the sanctioned use of oxymorons like "the environmentally sound management of hazardous wastes" (20.22 Hazardous wastes) or "the promoting the safe and environmentally sound management of radioactive wastes" (Chapter 22 Radioactive wastes)
- the sanctioned use of term like "harmonizing" which usually leads not the highest tenable principles but to the lowest common denominator
- the unwillingness to redefine development in terms of ecologically sound practices; such as
  - (i) the degree to which a state has been able to integrate with the ecosystem through ecological sound practices causing its human activity to have little deleterious impact on the environment
  - ii) The degree to which there is an equitable distribution of resources
  - iii) the extent to which a state refrains from contributing to global ecological or military harm
  - iv)The degree of condemnation, and avoidance of over-consumption

- v) the ability to minimize the human impact on the environment through stabilization of population
- vi) the degree of compliance with the enshrining of positive rights ( right to ecologically sound work, to food, to shelter as well as with negative rights)
- (vii) the ability to live within the carrying capacity of the ecosystem; in which case the US could possibly be the least developed

- the stereotyping of countries into categories of "developed, underdeveloped, and developing" rather than designating behaviours and attitudes as being "developed, underdeveloped and developing";
- the simplistic distinction between North (environment) and South (development)
- the presumption that technological transfer should always pass from "North" to "South"
- the reluctance to deal with essential issues such as the link between "Nuclear civil reactors and Nuclear Arms Industry" or the Link between Poverty and lack of universal " secondary" as well as "primary" health care system (3.6. e Combating Poverty)
- the reluctance to address the environmental degradation caused by military operations  
("Systemic Constraints preventing change," Russow J. & White, D. in progress)

## PART 1: CONTENT ANALYSIS

### Acknowledgements and principles, from UNCED, that could facilitate change

Although many of the above constraints appear to have influenced the ability of the global community to address the urgency of the global situation, there are many internationally adopted acknowledgements and principles arising out of UNCED that do express the global condemnation of ecologically unsound practices.

In general the NGO community has concentrated on the 40 treaties emerging from the Global Forum, and have, recognizing the limitations of the formal negotiating process, neglected to examine the documents emerging from the formal proceedings at the Rio Centro. Although the 40 treaties make a significant contribution to addressing the urgency of the current global situation, and are worthy of continued distribution and commitment; the NGO, the general public and professional groups can use the globally agreed to principles contained in the official UNCED documents as moral suasion to ensure that as a minimum states undertake to fulfill the principles agreed to at Rio.

I have attempted to do a content analysis of the significant acknowledgements and principles that have emerged from the Rio Declaration and from Agenda 21, the two documents from UNCED that were adopted through global consensus at Rio. The Rio Declaration which is a precursor to an Earth Charter enunciates certain principles which though not binding could be of strong moral suasion. Agenda 21 delineates certain acknowledgements of the current global situation and advocates actions which though not binding also could be of strong moral suasion.

Agenda 21 is divided into distinct sections and chapters dealing with the following issues:

Section I Social and economic dimensions

1. Preamble
2. International cooperation to accelerate sustainable development in developing countries and related domestic policies
3. Combating poverty
4. Changing consumption patterns
5. Demographic dynamics and sustainability
6. Protecting and promoting human health conditions
7. Promoting sustainable human settlement development
8. Integrating environment and development in decision-making

Section II Conservation and management of resources for development

9. Protection of the atmosphere
10. Integrated approach to the planning and management of land resources
11. Combating deforestation
12. Managing fragile ecosystems: combating desertification and drought
13. Managing fragile ecosystems: sustainable mountain development
14. Promoting sustainable agriculture and rural development
15. Conservation of biological diversity
16. Environmentally sound management of biotechnology
17. Protection of oceans, all kinds of seas, including enclosed and semi-enclosed seas, and coastal areas and the protection, rational use and development of their living resources
18. Protection of the quality and supply of freshwater resources: application of integrated approaches to the development, management and use of water resources
19. Environmentally sound management of toxic chemicals, including prevention of illegal international traffic in toxic and dangerous products
20. Environmentally sound management of hazardous wastes, including prevention of illegal international traffic in hazardous wastes
21. Environmentally sound management of solid wastes and sewage-related issues
22. Safe and environmentally sound management of radioactive wastes

Section III Strengthening the role of major groups ( chapter topics not listed in this paper)

Section IV Means of Implementation ( chapter topics not listed in this paper)

(Organizational structure of Agenda 21)

## **0. OVERVIEW:**

### **A VERY PRELIMINARY CONTENT ANALYSIS OF THE RIO DECLARATION AND OF SECTIONS 1-22 OF AGENDA 21 AND (JULY 5, 1992)**

STATEMENTS THAT MIGHT BE USEFUL AS MORAL SUASION TO ENSURE THAT COUNTRIES ACT IN ACCORDANCE WITH THE COMMITMENTS MADE THROUGH GLOBAL CONSENSUS AT THE EARTH SUMMIT

Note: unless otherwise indicated all references are to Agenda 21

*The following content analysis is primarily an attempt to get beyond the fragmentation of the global problem into distinct issues, to find fundamental principles that could be used as an indication of true global concern about the environment. It must be stressed that this content analysis is very preliminary and it was prepared as background material for a series of presentations, briefs, submissions to Constitutional debate and as background material for a university course on global issues. It is only circulated as a beginning attempt to find possible ways of using documents ( Rio Declaration and particularly Agenda 21) that have been globally adopted by consensus. In this content analysis, statements are quoted verbatim because the delegates and eventually the state leaders agreed to specifically worded statements. If the principles enunciated from UNCED are to be used effectively, it would seem that the original wording and not a paraphrase of the principles would be necessary.*

## **1. RECOGNITION OF NEED TO QUALIFY THE "SOVEREIGN RIGHT TO EXPLOIT RESOURCES**

### **1.1. PROVIDING CONSERVATION OF BIODIVERSITY AND BIOLOGICALLY SUSTAINABLE USE**

" At the same time, it is particularly important in this context to stress that States have the sovereign right to exploit their own biological resources pursuant to their environmental policies, as well as the responsibility to conserve their biodiversity and use their biological resources sustainably, and to ensure that activities within their jurisdiction or control do not cause damage to the biological diversity of other states or of areas beyond the limits of national jurisdiction. " (15.3 Biodiversity)

"Governments at the appropriate level, with the support of relevant international and regional organizations, should promote the following activities in conformity with international agreements or arrangements on biological diversity, as appropriate" (Biotechnology, 16.7)

### **1.2. PROVIDING NO DAMAGE OR ENDANGER LOCAL ECOSYSTEMS**

"Acceleration of technology acquisition, transfer and adaptation by developing countries to support national activities that promote food security, through the development of systems for

substantial and sustainable productivity increases that do not damage or endanger local ecosystems.

## **2. RECOGNITION AND DELINEATION OF BASIC NEEDS.**

" Governments should establish measures that will directly or indirectly set up an effective primary health care and maternal health care system accessible to all " (3.7.e Combating Poverty)

" undertake activities aimed at the promotion of food security and, where appropriate, food self-sufficiency within the context of sustainable agriculture" (3.7.l Combating Poverty)

" Consider making available lines of credit and other facilities for the informal sector and improved access to land for the landless poor so that they can acquire the means of production and reliable access to natural resources." (3.7.o Combating Poverty)

" provide the poor with access to fresh water and sanitation" (3.7.p Combating Poverty)

"provide the poor with access to primary education."(3.7.q Combating Poverty)

"... the provision of a safe water supply and sanitation and the promotion of a safe food supply and proper nutrition. Particular attention should be directed towards food safety, with priority placed on the elimination of food contamination; comprehensive and sustainable water policies to ensure safe drinking water and sanitation to preclude both microbial and chemical contamination; and promotion of health education...education and appropriate services regarding responsible planning of family size... values... ." (6.3. Protecting and promoting health)

" Access to safe and healthy shelter is essential to a person's physical, psychological, social and economic well-being and should be a fundamental part of national and international action. The right to adequate housing as a basic human right is enshrined in the Universal Declaration of Human rights and the International Covenant on Economic, Social and Cultural rights." (7.6, Settlement)

"The improvement of human health is one of the most important objectives of development."

"The deterioration of environmental quality, notably air, water and soil pollution owing to toxic chemicals, hazardous wastes, radiation and other sources, is a matter of growing concern. ..Malnutrition, poverty, poor human settlements, lack of

good-quality potable water and inadequate sanitation facilities add to the problems of communicable and non-communicable diseases. As a consequence, the health and well-being of people are exposed to increasing pressures.” (16.12 Biotechnology)

“Water is a finite resource, essential for the sustenance of life on earth” ( 18.2 Freshwater)

“water is needed in all aspects of life” ( 18.6 fresh water

“freshwater resources are an essential component of the earth's hydrosphere and an indispensable part of all terrestrial ecosystems. (18.7 Fresh water)

“Priority must be given to the sustenance of land/water ecosystems, with particular attentions to wetlands and biodiversity, and the satisfaction of basic human needs for drinking-water, health protection and food security.” ( 18.8. Fresh water)

“One in three people in the developing world still lacks these two (safe drinking-water and sanitation) more basic requirements for health and dignity.” ( 18.58 Freshwater)

### **3. ACKNOWLEDGEMENT AND ASSESSMENT OF GLOBAL URGENCY**

- **Extent and scope of urgency**

“Humanity stands at a defining moment in history. We are confronted with a perpetuation of disparities between and within nations, a worsening of poverty, hunger, ill health and illiteracy, and the continuing deterioration of the ecosystems on which we depend for our well-being. ...” (1.1 Preamble)

- **Poverty and inequity**

“The eradication of poverty and hunger, greater equity in income distribution and human resources development remain major challenges everywhere. The struggle against poverty is the shared responsibility of all countries” ( 3.1 combating poverty)

- **Extent of Unsustainable consumption**

[ one of the most serious problems now facing the planet is that associated with historical patterns of unsustainable consumption and production, leading to environmental degradation, aggravation of poverty and imbalances in the development of countries.] (4.3 Changing consumption patterns)

- **Increase in global population**

"The growth of world population and production combined with unsustainable consumption patterns places increasingly severe stress on the life-supporting capacities of our planet..."(5.2, Demographic dynamics)

- **Linking of population and over-consumption**

["Health and development are intimately interconnected. both insufficient development leading to poverty and inappropriate development resulting in over-consumption, coupled with an expanding world population, can result in severe environmental health problems in both developing and developed nations." ]

6.1 Health

- **Extent of air, water and land pollution**

" In many locations around the world the general environment ( air, water, and land), workplaces and even individual dwellings are so badly polluted that the health of hundreds of millions of people is adversely affected. This is, inter alia, due to past and present developments in consumption and production patterns and lifestyles, in energy production and use, in industry, in transportation etc. with little or no regard for environmental protection." ( 6.40, Protection of health)

- **Nature of inequity between "developed" and "undeveloped" states**

" In industrialized countries, the consumption patterns of cities are severely stressing the global ecosystem, while settlements in the developing world need more raw material, energy, and economic development simply to overcome basic economic and social problems." (7.1. Settlement )

"...It is estimated that at the present time, at least 1 billion people do not have access to safe and healthy shelter and that if appropriate action is not taken, this number will increase dramatically by the end of the century and beyond." ( 7.6, Settlement)

" The rising costs of urban land prevent the poor from gaining access to suitable land. In rural areas, unsustainable practices, such as the exploitation of marginal lands and the encroachment on forests and ecologically fragile areas by commercial interests and landless rural populations, result in environmental degradation, as well as in diminishing returns for impoverished rural settlers" ( 7.28, Settlement)

- **Extent of trans-boundary air pollution**

" Trans-boundary air pollution has adverse health impacts on humans and other detrimental environmental impacts, such as

tree and forest loss and the acidification of water bodies...” (9.22, Atmosphere)

- **Increased depletion of Earth's stratosphere**

" Analysis of recent scientific data has confirmed the growing concern about the continuing depletion of the Earth's stratospheric ozone layer by reactive chlorine and bromine from man-made CFC's, halons and related substances. While the 1985 Vienna Convention for the Protection of the Ozone Layer and the 1987 Montreal Protocol on Substances that Deplete the Ozone Layer ( as amended in London in 1990) were important steps in international action, the total chlorine loading of the atmosphere of ozone-depleting substances has continued to rise. This can be changed through compliance with the control measures identified within the Protocol “(9.19 Atmosphere)

- **Possible reduction of resilience of ecosystem to climatic variation because of loss of biological diversity**

" The loss of biological diversity may reduce the resilience of ecosystems to climatic variations and air pollution damage. Atmospheric changes can have important impacts on forests, biodiversity, and freshwater and marine ecosystems, as well as on economic activities, such as agriculture.” (9.16 Atmosphere)  
cross link with clear cut

- **Increased deforestation and land degradation**

"Forests worldwide have been and are being threatened by uncontrolled degradation and conversion to other types of land uses, influenced by increasing human needs; agricultural; expansion, and environmentally harmful mismanagement, including, for example, lack of adequate forest-fire control and anti-poaching measures, unsustainable commercial logging, overgrazing and ... the impacts of loss and degradation of forests are in the form of soil erosion; loss of biological diversity, damage to wildlife habitats and degradation of watershed areas, deterioration of the quality of life and reduction of the options for development.” (11.12. Deforestation)

- **Urgent need for conservation**

"The present situation calls for urgent and consistent action for conserving and sustaining forest resources. The greening of suitable areas, in all its component activities, is an effective way of increasing public awareness and participation in protecting and managing forest resources. It should include the consideration of land use and tenure patterns and local needs and should spell out and clarify the specific objectives of the different types of greening activities” ( 11. 13, Deforestation)

see quote on original proposal for UNCED

- **Increased desertification**

“Desertification affects about one sixth of the world's population, 70% of all drylands, amounting to 3.6 billion hectares, and one quarter of the total land areas of the world. The most obvious impact of desertification, in addition to widespread poverty, is the degradation of 3.3 billion hectares of the total area of rangeland, constituting 73 per cent of the rangeland with a low potential for human and animal carrying capacity decline in soil fertility and soil structure on about 47 per cent of the dryland areas constituting marginal rainfed cropland; and the degradation of irrigated cropland, amounting to 30 % of the dryland areas with a high population density and agricultural potential.” (12.2. Desertification)

- **Increased loss and degradation of mountain ecosystems**

“Mountain ecosystems are, however, rapidly changing. They are susceptible to accelerated soil erosion, landslides and rapid loss of habitat and genetic diversity. On the human side, there is widespread poverty among mountain inhabitants and loss of indigenous knowledge. As a result, most global mountain areas are experiencing environmental degradation.” ( 13.1. Fragile ecosystems)

- **Increased watershed deterioration**

"There are serious problems of ecological deterioration in these watershed areas. ... In many areas this is accompanied by excessive livestock grazing, deforestation and loss of biomass cover.”(13.13 Fragile ecosystems)

- **Increased ignoring of carrying capacity of land**

" Inappropriate and uncontrolled land uses are a major cause of degradation and depletion of land resources. Present land use often disregards the actual potentials, carrying capacities and limitations of land resources as well as their diversity in space.” (14.34 Agriculture)

- **Increased poverty and malnutrition**

"Poverty and malnutrition are already endemic in many regions. The destruction and degradation of agricultural and environmental resources is a major issue” ( 14.35 Agriculture)

- **Acute land degradation**

"Land degradation is the most important environmental problem affecting extensive areas of land in both developed and developing countries. The problem of soil erosion is particularly acute in developing countries, while problems of salinization,

waterlogging, soil pollution and loss of soil fertility are increasing in all countries. "(14.44 Agriculture)

- **Acute threat to genetic diversity**

" Plant genetic resources for agriculture are an essential resource to meet future needs for food. Threats to the security of these resources are growing, and efforts to conserve, develop and use genetic diversity are underfunded and understaffed...(14.54 Agriculture)

- **Overuse of chemicals**

"Chemical control of agricultural pests has dominated the scene, but its overuse has adverse effects on farm budgets, human health and the environment..."(14.74 Agriculture)

- **Loss of biodiversity through ecologically unsound practices**

" Despite mounting efforts over the past 20 years, the loss of the world' biological diversity, mainly from habitat destruction, over-harvesting, pollution and the inappropriate introduction of foreign plants and animals has continued." (15.3 Biodiversity)

- **Increased deterioration of the environment through anthropogenic actions**

"The improvement of human health is one of the most important objectives of development. The deterioration of environmental quality, notably air, water and soil pollution owing to toxic chemicals, hazardous wastes, radiation and other sources, is a matter of growing concern. ..Malnutrition, poverty, poor human settlements, lack of good-quality potable water and inadequate sanitation facilities add to the problems of communicable and non-communicable diseases. As a consequence, the health and well-being of people are exposed to increasing pressures." (16.12 Biotechnology)

- **Extent of environmental damage from waste accumulation**

" The environment is threatened in all its biotic and abiotic components: animals, plants, microbes and ecosystems comprising biological diversity; water, soil and air, which form the physical components of habitats and ecosystem; and all the interactions between the components of biodiversity and their sustaining habitats and ecosystem. With the continued increase in the use of chemicals, energy and non-renewable resources by expanding global population, associated environmental problems will also increase. Despite increasing efforts to prevent waste accumulation and to promote recycling, the amount of environmental damage caused by over-consumption, the quantities of waste generated and the degree of unsustainable land use appear likely to continue growing." (16.22 Biotechnology)

- **Nature of marine environment degradation**

" Degradation of the marine environment can result from a wide range of sources. Land-based sources contribute 70% of marine pollution, while maritime transport and dumping-at-sea activities contribute 10 % each." (17.19. Marine)

- **Extent of vulnerability of marine environment to change**

" The marine environment is vulnerable and sensitive to climate and atmospheric changes." (17.101, marine)

"Small increases in sea level have the potential of causing significant damage to small islands and low-lying coasts" ( 17.102 Marine)

- **increased erosion and soil loss in river basins**

" Poor land-use management, including deforestation and non-sustainable agriculture, mining and urbanization, could lead to a considerable increase in erosion problems and related soil loss in the river basins. The sedimentation in large reservoirs may have serious adverse effects downstream by reducing the quantity of natural nutrients available to agricultural land and coastal waters. .. Acidification of surface waters and groundwaters due to atmospheric deposition of air pollutants can lead to depletion of freshwater living resources and thereby contribute to the loss of biodiversity." (18.3 Freshwater )

- **Increased impact of global climate changes**

"Global climate changes could also have an impact on freshwater resources and on the availability of those resources, and through sea-level rise and atmospheric pollution, threaten coastal aquifers and small island ecosystems." ( 18.7, Fresh water)

- **Increased loss of Freshwater quality through ecologically unsound products and practices**

" Freshwater is a unitary resource. Long-term development of global freshwater requires holistic management of resources and a recognition of the inter-connectedness of the elements related to freshwater and freshwater quality. There are few regions of the world that are still exempt from the problems of loss of potential sources of freshwater supply, degraded water quality and pollution of surface and groundwater sources. Major problems affecting the water quality of rivers and lakes arise, in variable order of importance according to different situations, from inadequately treated domestic sewage, inadequate controls on the discharges of industrial waste waters, loss and destruction of catchment areas, ill-considered siting of agricultural practices. This gives rise to the leaching of nutrients and pesticides. Aquatic ecosystems are disturbed and living

freshwater resources are threatened. ...Erosion, degradation, deforestation and desertification have led to increased land degradation, and the creation of reservoirs has, in some cases, resulted in adverse effects on ecosystems. Many of these problems have arisen from a development model that is environmentally destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems. A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies." (18.45 Fresh water)

• **Continued lack of basic requirements**

"One in three people in the developing world still lacks these two (safe drinking water and sanitation) basic requirements for health and dignity." (18.58 Fresh water)

• **Increased impact of population growth and industrialization**

"Rapid urban population growth and industrialization are putting severe strains on the water resources and environmental protection capabilities of many cities" (18.67, Fresh water)

• **Continued impact of mismanagement and overexploitation**

"Soil erosion, mismanagement and overexploitation of natural resources and acute competition for water have all influenced the extent of poverty, hunger and famine in the developing countries. Soil erosion caused by overgrazing of livestock... Most often, the development of irrigation schemes is supported neither by environmental impact assessments identifying hydrologic consequences within watersheds of interbasin transfer..." (18.76, Fresh water)

• **Potential outcome of climate change**

"There is uncertainty with respect to the prediction of climate change at the global level. Although the uncertainties increase greatly at the regional, national and local levels, it is at the national level that the most important decisions would need to be made. Higher temperatures and decreased precipitation would lead to decreased water supplies and increased water demands; they might cause deterioration in the quality of freshwater bodies, putting strains on the already fragile balance between supply and demand in many countries. Even where precipitation might increase, there is no guarantee that it would occur at the time of year when it could be used; in addition there might be a likelihood of increased flooding. Any rise in sea-level will often cause the intrusion of salt water into estuaries, small

islands and coastal aquifers and the flooding of low-lying coastal areas; this puts low-lying countries at great risk.” (18.93 Fresh water)

- **Continuous degradation of human health and the environment**

"Human health and environmental quality are undergoing continuous degradation by the increasing amount of hazardous wastes being produced. There are increasing direct and indirect costs to society and to individual citizens in connection with the generation, handling and disposal of such wastes." (20.9 Hazardous waste)

- **Unprecedented Increase in environmentally persistent wastes**

"Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally persistent wastes at unprecedented rates. The trend could significantly increase the quantities of wastes produced by the end of the century and increase quantities four to fivefold by the year 2025." (21.7 Solid wastes)

- **Increased generation of nuclear wastes**

"Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste (as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. The high-level waste contains about 99 percent of the radionuclides and thus represents the largest radiological risk." (22.1. Radioactive wastes)

- **Continued trafficking in toxic and dangerous products**

"Illegal traffic in toxic and dangerous products (toxic and dangerous products are those that are banned, severely restricted, withdrawn or not approved for use or sale by governments in order to protect public health and the environment). see resolutions 42/183 and uu/226 (19.67 Toxic chemicals)"  
"(21.28 Solid wastes)

- **Continued non-provision for basic sanitation**

by the end of the century, over 2.0 billion people will be without access to basic sanitation, and an estimated half of the urban population in developing countries will be without adequate solid waste disposal services. As many as 5.2 million people, including 4 million children under five years of age, die each year from waste-related diseases. The health impacts are particularly severe for the urban poor.

## **4. CONDEMNATION OF ECOLOGICALLY UNSOUND PRACTICES OR OUTCOMES**

### **4.1. PRODUCTS**

#### **•radiation,**

"The improvement of human health is one of the most important objectives of development. The deterioration of environmental quality, notably air, water and soil pollution owing to toxic chemicals, hazardous wastes, radiation and other sources, is a matter of growing concern. ..Malnutrition, poverty, poor human settlements, lack of good-quality potable water and inadequate sanitation facilities add to the problems of communicable and non-communicable diseases. As a consequence, the health and well-being of people are exposed to increasing pressures." (16.12 Biotechnology)

#### **•Chemicals**

"To increase the use of integrated pest, disease and crop management techniques to eliminate overdependence on agrochemicals, thereby encouraging environmentally sustainable agricultural practices" ( 16.2 c Biotechnology)

"Examination of the implications of the withdrawal of subsidies and the possible use of other economic instruments to reflect the environmental costs associated with unsustainable use of agrochemicals " ( 16.6 b Biotechnology)

"Develop applications to minimize the requirement for unsustainable synthetic chemical input and to maximize the use of environmentally appropriate products, including natural products "( 16.25, Biotechnology)

#### **•CFC's**

" Protection of the atmosphere can be enhanced ...replacing chlorofluorocarbons and other ozone-depleting substances with appropriate substitutes, as well as by reducing wastes and by-products." (9.13, Atmosphere)

#### **•Greenhouse gases**

the objectives of this programme area are: reducing atmospheric pollution or limiting anthropogenic emissions of greenhouse gases

#### **•Loss of biodiversity**

" ...the uncontrolled introduction of exotic plant and animal species..."(11.15 G Deforestation)

" Despite mounting efforts over the past 20 years, the loss of the world' biological diversity, mainly from habitat destruction, over-harvesting, pollution and the inappropriate introduction of foreign plants and animals has continued." (15.3 Biodiversity)

## 4.2. PRACTICES

### •Development models

"Many of these problems have arisen from a development model that is environmentally destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems."

(18.45 Fresh water)

### •Consumptive patterns

"Achieving the goals of environmental quality and sustainable development will require efficiency in production and changes in consumption patterns in order to emphasize optimization of resource use and minimization of waste. In many instances, this will require reorientation of existing production and consumption patterns that have developed in industrial societies and are in turn emulated in much of the world." (4.15 Changing consumption patterns)

[While poverty largely results in certain kinds of environmental stress one of the most serious problems now facing the planet is that associated with historical patterns of unsustainable consumption and production, leading to environmental degradation, aggravation of poverty and imbalances in the development of countries] ( 4.3.

"Measures to be undertaken at the international level for the protection and enhancement of the environment must take fully into account the current imbalances in the global patterns of consumption and production" (4.4 Changing consumption patterns)

[ Special attention should be paid to the demand for natural resources generated by unsustainable consumption and to the efficient use of those resources consistent with the goal of minimizing depletion and reducing pollution. Although consumption patterns are very high in certain parts of the world, the basic consumer needs of a large section of humanity are not being met. This inequitable distribution of income and wealth results in excessive demands and unsustainable lifestyles among the richer segments, which place immense stress on the environment. The poorer segments, meanwhile, are unable to meet food, health care, shelter and educational needs. Change consumption patterns will require a multi-pronged strategy focusing on demand, meeting the basic needs of the poor, and reducing wastage and the use of finite resources in the production process. ] 4.5 note: section put in brackets by U.S. " States should pay special attention to efficient use of natural

resources consistent with the goal of minimizing depletion and reducing pollution. This would help countries to meet their peoples food health care shelter and educational needs. The poor suffer from environmental degradation that can deepen the problem of development in particular as they struggle with agricultural problems and problems of health, hygiene which are endemic to the poor. At time environmental degradation caused by the consumptive patterns of others can intensify the environmental problem the poor face. Poverty is closely linked to environmental stress.” ( U.S Suggestion for alternative to 4.5)

" Developing countries should seek to achieve sustainable consumption patterns in their development process, guaranteeing the provision of basic needs for the poor, while avoiding those unsustainable patterns, particularly in industrialized countries, generally recognized as unduly hazardous to the environment, inefficient and wasteful in their development processes. This requires enhanced technological and other assistance from industrialized countries..." (4.8 c Changing consumption patterns)

**Inadequate sewage treatment (see marine 17.28)**

"promoting primary treatment of municipal sewage discharged to rivers, estuaries and the sea, or other solutions appropriate to specific sites" ( 17.28 e Marine )

**5. PROPOSALS OF STRONG MEASURES TO PREVENT ECOLOGICALLY UNSOUND PRACTICES AND TO ADDRESS INEQUITY**

**ECOLOGICALLY UNSOUND PRACTICES**

"...Considering the prohibition of those(harmful pesticides, fertilizers) found to be environmentally unsound." (17.28. i marine )

" eliminating the emission or discharge of organohalogen compounds that threaten to accumulate to dangerous levels in the marine environment." ( 17.28 Marine)

“And the phasing out or banning of toxic chemicals that pose an unreasonable and otherwise unmanageable risk to the environment or human health and those that are toxic, persistent and bio-accumulative and whose use cannot be adequately controlled.” 19.50 b Toxic chemicals)

"Governments should intensify research and development activities on cost-effective alternatives for processes and substances that currently result in the generation of hazardous wastes that pose particular problems for environmentally sound disposal or treatment, the possibility of ultimate phase-out of those substances that present an unreasonable or otherwise unmanageable risk and are toxic, persistent and bio-

accumulative to be considered as soon as practicable. *Emphasis should be given to alternatives that could be economically accessible to developing countries* (20.13. c hazardous wastes)

" States, with the co-operations of international organizations *where appropriate*, should encourage industry to promote and undertake research into the phase-out of the processes that pose the greatest environmental risk based on hazardous wastes generated." (20.18 b Hazardous wastes)

## INEQUITY

" The United Nations system, through its relevant organs, organizations and bodies, in cooperation with Member States and with appropriate international and non-governmental organizations, should make poverty alleviation a major priority and should promote international cooperation to address the root causes of poverty"  
( 3.10.e. Combating Poverty)

" to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity"  
( 4.7.a Changing Consumption Patterns)

" to develop a better understanding of the role of consumption and how to bring about more sustainable consumption patterns."(4.7.b Changing Consumption Patterns)

## 6. CALL FOR INTERNATIONAL STANDARDS PRINCIPLES

### 6.1. INTERNATIONAL STANDARDS

"To develop and apply pollution control and measurement technologies for stationary and mobile sources of air pollution and to develop alternative environmentally [safe and] sound technologies;" ( see trans-boundary ) (9.24 a Atmosphere)

" As a first step towards the goal of providing adequate shelter for all, all countries should take immediate measures to provide shelter to their homeless poor, while the international community and financial institutions should undertake actions to support efforts of the developing countries to provide shelter to the poor." (7.9. Settlement)

" Not later than the year 2000, to improve and implement plant protection and animal health services, including mechanism to control the distribution and use of pesticides, and to implement the International Code of Conduct on the Distribution and Use of Pesticides"(14.75 a Agriculture)

" Promote cooperation between the parties to relevant international conventions and action plans with the aim of

strengthening and coordinating efforts to conserve biological diversity and the sustainable use of biological resources.” (15.8 e. biodiversity)

“Strengthen support for international and regional instruments, programmes and action plans concerned with the conservation of biological diversity and the sustainable use of biological resources.” (15.8 f Biodiversity)

" The aim of this programme area is to ensure safety in biotechnology development, application, exchange and transfer through international agreement on principles to be applied on risk assessment and management," \*\*\* (16.33 Biotechnology)

" Compile update and develop compatible safety procedures into a framework of internationally agreed principles to be applied on safety in biotechnology [as a basis for the development of an international agreement...](16.35 c Biotechnology)

" to produce guidelines for *acceptable* exposure for a greater number of toxic chemicals, based on peer review and scientific consensus distinguishing between health or environment based exposure limits and those relating to socio-economic factors." (19.13 b.Toxic chemicals)

" Develop an internationally agreed upon code of principles for the management of trade in chemicals, recognizing in particular the responsibility for making available information on potential risks and environmentally sound disposal practices if those chemicals become wastes, in cooperation with governments and relevant international organizations and appropriate agencies of the United Nations system" (19.51 Toxic chemicals)

" A relevant and competent United Nations organization should take the lead, in cooperation with other organizations, to develop guidelines for estimating the costs and benefits of various approaches to the adoption of cleaner production and waste minimization and environmentally sound management of hazardous wastes, including rehabilitation of contaminated sites" (see 1991 Nairobi meeting and Basel Convention) (20.13. j, Hazardous wastes)

"To facilitate the assessment of impacts and risks of hazardous wastes on human health and the environment by establishing appropriate procedures, methodologies, criteria and / or effluent-related guidelines and standards" (20.22 g Hazardous Wastes)

"International organizations should provide assistance to member states in assessing the health and environmental risks resulting from exposure to hazardous wastes, and in identifying

their priorities for controlling the various categories or classes of wastes” (20.27 Hazardous wastes)

“There is a need to harmonize the procedures and criteria used in various international and legal instruments. There is also a need to develop or *harmonize* existing criteria for identifying wastes dangerous to the environment and to build monitoring capacities.” ( 20.33 Hazardous wastes)

"To facilitate and strengthen international cooperation in the environmentally sound management of hazardous wastes, including control and monitoring of trans-boundary movements of such wastes, including wastes for recovery, by using internationally adopted criteria to identify and classify hazardous wastes and to harmonize relevant international legal instruments.” (2034 a Hazardous wastes)

" Promote the development of clear criteria and guidelines, within the framework of the Basel Convention and regional conventions, *as appropriate*, for environmentally and *economically sound* operation in resource recovery, recycling reclamation, direct use of alternative uses and for determination of acceptable recovery practices, including recovery levels where feasible and appropriate, with a view to preventing abuses and false presentation in the above operations.” (20.35 e Hazardous wastes)

"States, in cooperation with relevant international organizations, where appropriate, should ...b) *support efforts within IAEA to develop and promulgate radioactive waste safety standards or guidelines and codes of practices as an internationally accepted basis for the safe and environmentally sound management and disposal of radioactive wastes;*” (22.4 Radioactive wastes)

“Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems”.  
(18.45 Fresh water)

## **7. ECOLOGICAL SOUND ALTERNATIVE VISIONS, AND PRACTICES ( SEE SECTION ON ACKNOWLEDGEMENT AND ASSESSMENT OF GLOBAL URGENCY FOR SUPPORT FOR A NEW VISION)**

## 7.1. GENERAL PRINCIPLES

### **• Governments should take the lead**

"Governments themselves also play a role in consumption, particularly in countries where the public sector plays a large role in the economy and can have a considerable influence on both corporate decisions and public perception. They should therefore review the purchasing policies of their agencies and departments so that they may improve, where possible, the environmental content of government procurement policies, *without prejudice to international trade principles.*" ( 4.23, Consumption)

### **• Ethics must be considered** ( also 16.16 a and b)

"Governments at the appropriate level, with the assistance of international and regional organizations, academic and scientific institutions and the pharmaceutical industry, should taking into account appropriate safety and ethical considerations ( 16.14, biotechnology)

Establish and enforce screening , systematic sampling and evaluation procedures for drugs and medical technologies, with a view to barring the use of those that are unsafe for the purposes of experimentation; ensure that drugs and technologies relating to reproductive health are safe and effective" [and take account of ethical considerations] ( 16.14 c, Biotechnology)

### **• self-sufficiency is essential** (CHECK)

" Promote pilot plans and projects consisting of electrical, mechanical and thermal power ( gasifiers, biomass, solar driers, wind-pumps and combustion systems) that are appropriate and likely to be adequately maintained." (14.95 a. Agriculture)

"..to meet regional or national needs for comprehensively trained personnel capable of using advanced technology to reduce the 'brain drain' from developing to developed countries... ." ( 16.11 c, Biotechnology)

## 7.2. INSTRUMENTAL PRINCIPLES

### 7.2.1. PRECAUTIONARY PRINCIPLE

"Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." ( Rio Declaration, 1992).

### 7.2.2. VARIATIONS OF PRECAUTIONARY PRINCIPLE

"All energy sources will need to be used in ways that respect the atmosphere and the environment as a whole" (9.6. Atmosphere)

["Particularly relevant is the inclusion of prevention programmes rather than relying solely on remediation and treatment"] ( 6.1, Protecting and promoting human health)

" It is necessary to, inter alia apply preventive and precautionary approaches in project planning and implementation including prior assessment and systematic observations of the impacts of major projects" (17.5 d Marine areas)

- **Environmental considerations at design stage**

"States should encourage industry to develop schemes to integrate the cleaner production approach into design of products and management practices" (20.18, Hazardous wastes)

- **Disposal at source**

"By the year 2000 to establish, as appropriate integrate programmes for tackling pollution at the source and at the disposal site, with a focus on abatement actions in all countries" ( 6.41 c Protection of health ) (see sovereignty)

" Governments should encourage industry to treat, recycle, reuse and dispose of wastes at the source of generation, or as close as possible thereto, whenever hazardous waste generation is unavoidable and when it is both economically and environmentally efficient for industry to do so" (20.13 f Hazardous wastes)

" Encourage countries to seek waste disposal solutions within their sovereign territory and as close as possible to the sources of origin that are compatible with environmentally sound and efficient management." (21.31 Solid wastes)  
equal or more stringent standards of origin country  
(" Wherever they operate, transnational corporations and other large-scale enterprises should be encouraged to introduce policies and make commitments to adopt standards of operation with reference to hazardous waste generation and disposal that are equivalent to or no less stringent than standards in the country of origin, and Governments are invited to make efforts to establish regulations requiring environmentally sound management of hazardous wastes." 20.30 Hazardous wastes)

- **Precautionary, anticipatory and life-cycle approaches**

"consider adopting policies based on accepted producer liability principles, where appropriate, as well as precautionary, anticipatory and life-cycle approaches to chemical management, covering manufacturing, trade, transport, use and disposal" (19.50 a Toxic chemicals)

" Undertake concerted activities to reduce risks for toxic chemicals, taking into account the entire life cycle of the chemicals. These activities could encompass both regulatory and non-regulatory measures, such ... and the phasing out or

banning of toxic chemicals that pose an unreasonable and otherwise unmanageable risk to the environment or human health and those that are toxic, persistent and bio-accumulative and whose use cannot be adequately controlled” (19.50 b toxic chemicals)

**•Need for foresight**

"Each country should develop the knowledge and practical skills to foresee and identify environmental health hazards, and the capacity to reduce the risks. Basic capacity requirements must include knowledge about environmental health problems and awareness on the part of leaders, citizens and specialists..."(6.46 d Protection of health)

**•Preventive approach**

"A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies." (18.45 Fresh water)

" undertake measures to prevent soil erosion and promote erosion-control activities in all sectors." (13.16 Fragile ecosystem)

" other areas of risk reduction encompass the prevention of chemical accidents, prevention of poisoning by chemicals and the undertaking of toxicovigilance and coordination of clean-up and rehabilitation of areas damaged by toxic chemicals." (19,47, Toxic chemicals)

"Governments should include in national planning and legislation an integrated approach to environmental protection, driven by prevention and source reduction criteria, taking into account the 'polluter pays' principle, and adopt programmes for hazardous waste reduction, including targets and adequate environmental control" (20.20 b Hazardous Wastes)

" A preventive waste management approach focused on changes in lifestyles and in production and consumption patterns offers the best change for reversing current trends" (21.7 Solid wastes)

**•Polluter pay principle**

"Governments should include in national planning and legislation an integrated approach to environmental protection, driven by prevention and source reduction criteria, taking into account the 'polluter pays' principle, and adopt programmes for hazardous waste reduction, including targets and adequate environmental control "(20.20 b Hazardous Wastes)

" Governments should ...(b) apply the 'polluter pays' principle, where appropriate, by setting waste management charges at rates that reflect the costs of providing the service and ensure that those who generate the wastes pay the full cost of disposal in an environmentally safe way" (21.42 b Solid wastes)

•**Environmental costs**

“Adopt policies that minimize if not altogether avoid environmental damage, whenever possible” (7.42 a Settlement )  
social costs of environmental

[Continue research and other work aimed at developing methodologies and criteria for incorporating the social costs of the environmental and other impacts caused by industrial production, as well as the treatment and disposal of wastes generated, into the prices of the final products;] (9.15 d)

" a lack of awareness of the environmental costs incurred by sectorial and macroeconomic policies and hence their threat to sustainability” (14.7 a. agriculture)

(It is necessary to (17.5 Marine) " promote the development and application of methods, such as national resources and environmental accounting, that reflect changes in value resulting from uses of coastal and marine areas, including pollution, marine erosion, loss of resources and habitat destruction”

“Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits” ( 20.20 e Hazardous wastes)

• **Environmental assessment review**

" develop appropriate pollution control technology on the basis of risk assessment and epidemiological research for the introduction of environmentally sound production processes and suitable safe mass transport” 6.42. a) i. Protection of health)

“Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences” (7.42 Settlement )

" Develop improve and apply environmental impact assessments to foster sustainable industrial development” (9.15 b. Atmosphere)

" Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the assessment of the impacts of relevant policies and programmes on biological diversity” (15.5 k Biological diversity)

" Development of public education programmes directed at decision makers and the general public to encourage awareness and understanding of the relative benefits and risks of modern

biotechnology, according to ethical and cultural considerations.”  
(16.16 b, Biotechnology)

" There is a need for further development of internationally agreed principles on risk assessment and management of all aspects of biotechnology which should build upon those developed at the national level.” (16.32 Biotechnology)

" The aim of this programme area is to ensure safety in biotechnology development, application, exchange and transfer through international agreement on principles to be applied on risk assessment and management,” \*\*\* (16.33 Biotechnology)

" develop processes to reduce waste generation, treat waste before disposal and make use of biodegradable materials”  
(16.25 Biotechnology)

" a precautionary and anticipatory rather than a reactive approach is necessary to prevent the degradation of the marine environment. This requires inter alia, the adoption of precautionary measures, environmental impact assessments, clean production techniques, recycling, waste audits and minimization, construction and/or improvements of sewage treatment facilities, quality management criteria for the proper handling of hazardous substances, and a comprehensive approach to damaging impacts from air, land and water” (17.22. Marine)

States, in accordance with the provisions of the United Nations convention on the Law of the Sea on protection and preservation of the marine environment, commit themselves, in accordance with their policies, priorities and resources, to prevent, reduce and control degradation of the marine environmental so as to maintain and improve its life-support and productive capacities”. : (17.23 Marine)

To this end, it is necessary to

" apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it”; ( 17.23 a Marine)

" Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment;” (17.23 b Marine)

" as concerns other sources of pollution, priority actions to be considered by States may include” (17.29 Marine)

" promoting risk and environmental impact assessments to help ensure an acceptable level of environmental quality” ( 17.29 b Marine)

"could provide for prior environmental impact assessment, systematic observation and follow-up of major projects, including the systematic incorporation of results in decision-making" (17.6 d marine)

"could provide for periodic assessment of the impacts of external factors and phenomena to ensure that the objectives of integrated management and sustainable development of coastal areas and the marine environment are met" ( 17.6 g Marine)

"it is necessary to conduct regular environmental assessment of the state of the environment of coastal and marine areas" (17.8 c Marine)

"A preventive approach, where appropriate,. is crucial to the avoiding of costly subsequent measures to rehabilitate treat and develop new water supplies." (18.45 Freshwater)

"Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits" ( 20.20 e Hazardous wastes)

"In order to promote and strengthen international cooperation in the management, including control and monitoring, of trans-boundary movements of hazardous wastes, a precautionary approach should be applied." (20.33 Hazardous wastes)

"States, in cooperation with relevant international organizations, where appropriate, should ...b) encourage the London Dumping convention to expedite work to complete studies on replacing the current voluntary moratorium on disposal of low-level radioactive wastes at sea by a ban, taking into account the precautionary approach, with a view to taking a well informed and time decision on the issue "(22.5 Radioactive wastes)

" Governments should take the lead in establishing and strengthening, as appropriate, national procedures for environmental impact assessment, taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction" (20.20 e Hazardous wastes)

" Governments, according to their capacities and available resources and with the cooperation of the United Nations and other relevant organizations, as appropriate, should promote and support the integration and operation, at the regional and local levels as appropriate, of institutional and interdisciplinary groups that collaborate, according to their capabilities, in activities oriented towards strengthening risk assessment, risk

management and risk reduction with respect to hazardous wastes” (20.25 a Hazardous wastes)

•**Cradle-to-grave approach**

“...taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction...” (20.20 e Hazardous wastes)

• **Monitoring cradle to grave approach**

“Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits” ( 20.20 e Hazardous wastes)

•**Full life cycle care**

"[promote efficient use of materials and resources, taking into account all aspects related to life cycles of products.] "9.15 e

"risk reduction involves broad-based approaches to reducing the risks of toxic chemicals, taking into account the entire life cycle of the chemicals.” (19.45, Toxic chemicals)

•**Culture of safety**

"to promote a 'culture of safety' in all countries, especially those that are disaster-prone, the following activities should be carried out:” ( 7.60, Disasters)

•**Responsible care**

Industry should be encouraged to (19.51 Toxic chemicals))  
"develop application of a 'responsible care' approach by producers and manufacturers towards chemical products, taking into account the total life cycle of such products” ( 19.51 b.Toxic chemicals))

"States should encourage industry to exercise environmentally responsible care through hazardous waste reduction and by ensuring the environmentally sound reuse, recycling and recovery of hazardous wastes, as well as their final disposal” (20.18 d Hazardous wastes)

•**Unacceptability of insufficient or outdated criteria of acceptance**

“Governments, in cooperation with relevant international organizations and programmes, should carry out national reviews, as appropriate, of previously accepted pesticides whose acceptance was based on criteria now recognized as insufficient or outdated and of their possible replacement with other pest control methods, particularly in the case of pesticides

that are toxic, persistent and/or bio-accumulative.” (19.55 b Toxic chemicals))

•**Substitution of less harmful**

“...there are often alternatives to toxic chemicals currently in use. Thus risk reduction can sometimes be achieved by using other chemicals or even non-chemical technologies. The classic example of risk reduction is the substitution of harmless or less harmful substances for harmful ones. establishment of pollution prevention procedures and setting standards for chemicals in each environmental medium, including food and water, and in consumer goods, constitute another example of risk reduction.” (19.45 Toxic chemicals)

" Reduce over-dependence on the use of agricultural chemicals through alternative farming practices, integrated pest management and other appropriate means” (19.50, Toxic chemicals)

•**Reduction**

" to reduce the generation of hazardous wastes, to the extent feasible, as part of an integrated cleaner production approach” (20.11 a Hazardous waste)

" Establishment of long-term programmes and policies including targets where appropriate for reducing the amount of hazardous waste produced per unit of manufacture” (20.12 d. Hazardous wastes)

•**Minimization**

" Integration of cleaner production approaches and hazardous waste minimizations in all planning and the adoption of specific goals; ”(20.11a hazardous wastes)

Economics of prevention??? (20.11c Hazardous wastes)

" Promoting waste prevention and minimization as the principal objective of national waste management programmes” (21.14 Solid wastes)

"States, in cooperation with relevant international organizations, where appropriate, should a) promote policies and practical measures to minimize and limit, where appropriate, the generation of radioactive wastes and provide for their safe processing, conditioning, transportation and disposal” (22.4 a Radioactive wastes)

•**Stabilization**

“Establishment of an intermediate goal for the stabilization of the quantity of hazardous waste generated ”(20.12. c Hazardous wastes)

### 7.2.3. REORIENTATION OF PRACTICES

" training will be required to reorient current waste management practices to include waste reuse and recycling" (21.26 Solid waste)

#### •Polluter pay principle

" Governments, *according to their capacities and available resources* and with the cooperation of the UN and other relevant organization, *as appropriate* should make recommendations to the appropriate forums or establish or adapt norms, including the *equitable* implementation of the polluter pays principle" (20.39 b Hazardous wastes)

#### • tax rebates

" Applying economic and regulatory instruments, including tax incentives, to support the principle that generators of wastes pay for their disposal" (21.25 Solid wastes)

#### •Penalties

Effective prevention requires action through effective monitoring and the enforcement and imposition of appropriate penalties" (20.40 Hazardous wastes)

" Develop appropriate national enforcement programmes to monitor compliance with such legislation, detect and deter violations through appropriate penalties and give special attention to those who are known to have conducted illegal traffic in hazardous wastes and to hazardous wastes that are particularly susceptible to illegal traffic" (20.43 b Hazardous wastes)

### 7.2.4. MANDATE TO CHANGE CONSUMPTIVE PATTERNS OF DEVELOPMENT AND TO ADDRESS INEQUALITY

" Programs should: Contain a long-term strategy aimed at establishing the best possible conditions for sustainable local, regional and national development that would eliminate poverty and reduce the inequalities between various population groups. It should assist the most disadvantaged groups -- in particular, women, children and youth within those groups - refugees and people under occupation. The groups will include poor smallholders, pastoralists, artisans, fishing communities, landless people, indigenous communities, migrants and the urban informal sector." ( 3.5. c Combating Poverty)

" The focus here is on specific cross-cutting measures - in particular, in the areas of basic education, primary/maternal health care, and the advancement of women." (3.6. Combating poverty)

" governments [at the appropriate level] ... should "implement policies and programmes that will discourage inappropriate and polluting land-use practices and promote sustainable utilization

of terrestrial and marine resources and environmentally sound land-use practices" ( 9.18 a Atmosphere)

" Environmentally sound waste management must go beyond the mere safe disposal or recovery of wastes that are generated and seek to address the root cause of the problem by attempting to change unsustainable patterns of production and consumption." (21.4 Solid wastes)

#### 7.2.5. MANDATE TO CONSERVE

" the conservation, sustainable management and enhancement, where appropriate, of all sinks for greenhouse gases;" (9.17 ii Atmosphere ) re: forests

"the conservation and sustainable use of natural and environmental resources" [ in particular in agriculture and forestry sectors] (9.17 iii now 9.20 iii but substantially changed Atmosphere)

"to ensure sustainable management and, where appropriate conservation of existing and future forest resources;" (11.14 c Deforestation)

" Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources, involving in situ and ex situ measures and undertaking supportive measures to ensure sustainable utilization of biological resources and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities;" (11.15 b., Deforestation)

An integrated approach is needed for conserving, upgrading and using the nature resource base of land, water, plant, animal and human resources..."(13.13 Fragile ecosystems)

" The priority must be on maintaining and improving the capacity of higher potential agricultural lands to support an expanding population However, conserving and rehabilitating the natural resources on lower potential lands in order to maintain sustainable man/land rations is also necessary. "(14.3 Agriculture)

" Objectives are... to prepare and implement comprehensive policies and programmes leading to the reclamation of degraded

lands and the conservation of areas at risk, as well as improve the general planning, management and utilization of land resources and preserve soil fertility for sustainable agricultural development.” (14.45 b. Agriculture)

"Governments.. should strengthen and establish national land-resources data banks, including identification of the location, extent and severity of existing land degradation, as well as areas at risk, and relate the progress of the conservation and rehabilitation programmes launched in this regard; ” ( 14.47 b Agriculture)

" Develop priority conservation and rehabilitation programmes with advisory services to Governments and regional organizations.” (14.48 a Agriculture)

" The primary objective is to safeguard the world's genetic resources while preserving them to use sustainably. This includes the development of measures to facilitate the conservation and use of plant genetic resources networks of in situ conservation areas and use of tools such as collections and germ plasma banks. ”(14.55 Agriculture)

" The objectives and activities in this chapter of Agenda 21 are intended to improve the conservation of biological diversity and the sustainable use of biological resources. ”(15.1 Biodiversity)

" take effective economic, social and other appropriate incentive measures to encourage the conservation of biological diversity and the sustainable use of biological resources, including the promotion of sustainable production systems such as traditional methods of agriculture, agroforestry, forestry, range and wildlife management, which use, maintain or increase biodiversity ”(15.5 Biodiversity)

" Governments... and consistent with the requirements of international law should, as appropriate Identify and evaluate the potential economic and social implications and benefits of the conservation and sustainable use of terrestrial and aquatic species in each country, building upon the results of country studies” (15.6. Biodiversity)

" Promote the use of biotechnologies relevant to the conservation and scientific study of biological diversity and the sustainable use of biological resources” (16.25 j Biotechnology)

" conservation and restoration of altered critical habitats” (17.6 h.Marine )

"taking action to ensure respect of areas designated by coastal states, within their exclusive economic zones, consistent with international law, in order to protect and preserve rare or fragile ecosystems, such as coral reefs and mangroves;" ( 17.31 v Marine)

["Adequate new and additional financial resources are indispensable for the effective utilization and protection of freshwater resources..."] ( 18.13 Fresh water)

"Fisheries of inland waters should be so managed as to maximize the yield of aquatic food organisms in an environmentally sound manner. This requires the conservation of water-quality and quantity, as well as of the functional morphology of the aquatic environment". (1878 Freshwater)

#### 7.2.6. ACTIVITIES ADJACENT TO PROTECTED, PRESERVED OR CONSERVED AREAS

" Promote environmentally sound and sustainable development in areas adjacent to protected areas with a view to furthering protection of these areas" (15.5. Biological diversity)

#### 7.2.7.RESTORATION REHABILITATION AND RECOVERY

" Promote the rehabilitation and restoration of damaged ecosystems and the recovery of threatened and endangered species" (15.5 h Biological diversity)

### 8. PROMOTING OF ECOLOGICAL ALTERNATIVES

- Ecotourism

" the implications of the harvesting of forest resources for the other values of the forest should be taken fully into consideration in the development of forest policies. It is also possible to increase the value of forests through non-damaging uses such as eco-tourism and the managed supply of genetic materials. Concerted action is needed in order to increase people's perception of the value of forests and of the benefits they provide. (11.22.Deforestation )

"to promote more comprehensive use and economic contribution of forest areas by incorporating eco-tourism into forest management and planning." (11.23 d Deforestation)

"Promote the formulation of environmentally sound and culturally sensitive tourism programmes as a strategy for sustainable development of urban and rural settlements and as a way of

decentralizing urban development and reduction discrepancies among regions;" (7.21 e Settlement)

" to promote income-generating activities, such as sustainable tourism,... in particular to protect the livelihood of local communities and indigenous people" (13.15. b, fragile ecosystems)

" consider undertaking pilot projects that combine environmental protection and development functions with particular emphasis on some of the traditional environmental management practices or systems that have a good impact on the environment "(13.21.a Fragile ecosystem)

#### •energy

"cooperate to increase the availability of capacity, capabilities and relevant technologies--recognizing that technology includes biotechnology--in developing countries for utilizing and producing environmentally [safe and] sound renewable energy resources, such as solar, wind, geothermal, hydropower and biomass, including wood-fuel resource. Each resource should be utilized in a manner that fosters sustainable development and minimizes environmental stress and health impacts, emphasizing the need for easily available, cleaner burning, smoke-free household fuel." ( 9.9 g Atmosphere)

"objectives are ... Not later than the year 2000, to initiate and encourage a process of environmentally sound energy transition in rural communities, from unsustainable energy sources, to structures and diversified energy sources by making available alternative new and renewable sources of energy"(14.94 a Agriculture)

" Promote pilot plans and projects consisting of electrical, mechanical and thermal power ( gasifiers, biomass, solar driers, wind-pumps and combustion systems) that are appropriate and likely to adequately maintained." (14.95 a. Agriculture)

#### •transportation

"to plan and develop [safe and ] more efficient and less polluting transportation systems, especially mass transit to support economic development efforts in an environmentally [safe and] sound way, giving special attention to urban and metropolitan areas." ( 9.11.b Atmosphere)

#### •biodegradable materials

" develop processes to reduce waste generation, treat waste before disposal and make use of biodegradable materials" (16.25 Biotechnology)

- **minimization of use of hazardous chemicals including pesticides**

" Integrated pest management, which combines biological control, host plant resistance and appropriate far practices and minimizes the use of pesticides, is the best option for the future as it guarantees yields, reduces costs, is environmentally friendly and contributes to the sustainability of agriculture." (14.74 Agriculture)

"Promoting the use of environmentally less harmful pesticides and fertilizers and alternative methods for pest control, and considering the prohibition of those found to be environmentally unsound" (17.28 i)

"In the agricultural area, integrated pest management, including the use of biological control agents as alternatives to toxic pesticides, is one approach to risk reduction" (19.46 Toxic Chemicals)

## **9. ESTABLISHMENT OF DATA BASE AND CRITERIA FOR RESEARCH AND RECOGNITION OF NEED FOR ECOLOGICALLY SOUND RESEARCH PROPOSALS**

"The objective of this programme area is to undertake research to determine the effects of increased ultraviolet radiation resulting from stratospheric ozone layer depletion on the Earth's surface, and on plant and animal life in affected regions, as well as its impact on agriculture and to develop, as appropriate, strategies aimed at mitigating its adverse effects." (14.103 Agriculture)

" Long-term research into the importance of biodiversity for the functioning of ecosystems and the role of ecosystems in producing good, environmental services and other values supporting sustainable development with particular reference to the biology and reproductive capacities of key terrestrial and aquatic species, including native, cultivated and cultured species; ? observation and inventory techniques; ecological conditions necessary for biodiversity conservation and continued evolution; and social behaviour and nutrition habits dependent on natural ecosystems, where women play key roles. The work should be undertaken with the widest possible participation, especially of indigenous people and their communities, including women. " ( 15.5 f, Biological diversity)

" Governments, according to their capacities and available resources and with the cooperation of the United nations and other relevant organizations, and industries, as appropriate, should significantly increase financial support for cleaner technology research and development programmes including the use of biotechnologies." (20.18 a Hazardous wastes)

"Governments, municipalities and local authorities, with appropriate international cooperation, should undertake research on critical subjects such as low-cost, low-maintenance waste-eater treatment systems; safe sludge disposal options, industrial waste treatment; and low-technology, ecologically safe waste disposal options" (21.37 Solid wastes)

## LAND TENURE

14.46

## RESEARCH INTO ENVIRONMENTALLY SOUND TECHNOLOGIES

"promoting research and development in environmentally sound technologies" ( 4.18 b Changing consumption patterns)  
- "encouraging the environmentally sound and sustainable use of renewable natural resources". ( 4.18 e Changing consumption patterns)

" in rural areas, unsustainable practices, such as the exploitation of marginal lands and the encroachment on forests and ecologically fragile areas by commercial interests and landless rural populations, result in environmental degradation, as well as in diminishing returns for impoverished rural settlers." ( 7.28 2.Settlement)

" "strengthen the role of appropriate international research and training institutes such as the Consultative Group on International Agricultural Research Centers ( CGIAR) and the International Board for Soil Research and Management, as well as regional research centres, such as the Woodland Mountain institutes and International Centre for Integrated Mountain Development, is undertaking applied research relevant to watershed development;" (13.18 a Fragile ecosystems)

" strengthen and establish research in the public domain on PGRFA evaluation and utilization, with the objectives of sustainable agriculture and rural development in view;" (14.58 b, Agriculture)

## 9.2. SUPPORT FOR ARMS LENGTH RESEARCH

"Governments and institutions, in collaboration where necessary with appropriate international agencies and organizations, Universities and non-governmental organizations should undertake assessments and systematic observations of forests and related programmes and processes with a view to their continuous improvement". (11.34 Deforestation )

## 9.3. NEED FOR INDEPENDENT BODIES

"Institutional reforms and capacity-building will be indispensable if countries are to be able to quantify and mitigate waste-related pollution activities to achieve this objective should include;

creating and strengthening independent environmental control bodies at the national and local levels. International organizations and donors should support needed upgrading of manpower skills and provision of equipment.” (21.39 Solid wastes)

## **10 RECOGNITION OF NEED FOR PARTICIPATION IN DECISION MAKING (needs to be examined)**

### **10.1. DECENTRALIZATION OF RESPONSIBILITY PARTICIPATION OF COMMUNITY GROUPS ...**

" Empower community groups, non-governmental organizations and individuals to assume the authority and responsibility for managing and enhancing their immediate environment through participatory tools, techniques and approaches embodied in the concept of environmental care.” (7.21. g Settlement)

" The aim of this programme area is to ensure safety in biotechnology development...including the widest possible public participation and taking account of ethical considerations.” (16.33. Biotechnology)

“It is necessary to ...”(17.5. marine) "provide access, as far as possible, for concerned individuals, groups and organizations to relevant information and opportunities for consultation and participation in planning and decision -making at appropriate levels” ( 17.5 f)

## **11. PROPOSALS FOR ACCESS TO INFORMATION (needs to be examined)**

### **RIGHT TO KNOW**

"Industry should be encouraged to: (19.51, toxic chemicals) " adopt, on a voluntary basis, community right-to-know programmes based on international guidelines, including sharing of information on causes of accidental and potential releases and means of preventing them and reporting on annual routine emissions of toxic chemicals to the environment in the absence of host county requirements.” (19.51 c Toxic chemicals)

" Governments should encourage industries to be transparent in their operations and provide relevant information to the communities that might be affected by the generation, management and disposal of hazardous wastes” (20.14 f Hazardous wastes)

### **ACCESS TO INFORMATION**

“It is necessary to ...”(17.5. marine) "provide access, as far as possible, for concerned individuals, groups and organizations to

relevant information and opportunities for consultation and participation in planning and decision -making at appropriate levels” ( 17.5 f)

" Governments, international and regional organizations and industry should facilitate and expand the dissemination of technical and scientific information dealing with the various health aspects of hazardous wastes, and promote its application;" (20.24, a Hazardous wastes)

## NOTIFICATION PROCEDURES

“ Incorporate the notification procedure called for in the Basel Convention and relevant regional conventions, as well as in their annexes, into national legislation” (20.35 a Hazardous wastes)

## 12. PROPOSALS FOR ENVIRONMENTAL EDUCATION

" encourage education and awareness-raising programmes at the local, national, sub-regional and regional levels concerning energy efficiency and environmentally [safe and] sound energy system;" (9.9 j)

" Development of public education programmes directed at decision makers and the general public to encourage awareness and understanding of the relative benefits and risks of modern biotechnology, according to ethical and cultural considerations.” (16.16 b, Biotechnology)

" Promote the introduction of marine environmental protection topics into the curriculum of marine studies programmes; "( 17.41 b)

" educate communities about the pollution-related impacts of the use of fertilizers and chemicals on water-quality, food safety and human health;"(18.87 d vi Fresh water)

" to make information available to governments and to the general public on the effects of hazardous wastes, including infectious wastes, on human health and the environment ”(20.22 i Hazardous wastes)

“Governments, according to their capacities and available resources and with the cooperation of the United Nations, other organizations and non-governmental organizations, should collaborate in developing and disseminating educational materials concerning hazardous wastes and their effects on environment and human health, for use in schools, by women's groups and by the general public” (20.29 a Hazardous wastes)

“Countries should incorporate within school curricula, where appropriate, the principles and practices of preventing and minimizing wastes and material on the environmental impacts of waste” (21.15 Solid wastes)

In chapter 36 of Agenda 21, a very important distinction is made between promoting "education," promoting "public awareness," and promoting 'training." It appears to be clear in Agenda 21 that non-governmental organizations, community-based groups, women's groups and aboriginal groups are called upon to assist educational authorities in reorienting education. The role of industry is ascertained to be limited to specific areas of business and industrial and training programs.

" Educational authorities, with appropriate assistance of non-governmental organizations, including women's and indigenous peoples' organizations should promote all kinds of adult education programmes for continuing education in environment and development, basing activities around elementary/secondary schools and local problems. The authorities and industry should encourage business, industrial and agricultural schools to include such topics in their curricula. The corporate sector could include sustainable development in their education and training programmes." ( Agenda 21, Chapter 36.5 I)

In the section of Agenda 21 that addresses the " promoting of public awareness " industry is included not as the dispenser of "education" but as the recipient of needed education.

" Countries and regional organizations should be encouraged, as appropriate, to provide public environmental and development information services for raising the awareness of all groups, the private sector and particularly decision makers." (Agenda 21, section 36.10 c)

In the section of Agenda 21, that addresses the "promoting of training, an important role for industry is envisioned.

" To strengthen national capacities,... in training, to enable governments, employers and workers to meet their environmental and development objectives and to facilitate the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know -how" ( Agenda 21, 36.13 c)

### **13. RIGHTS OF INDIGENOUS PEOPLES**

UNCED Documents Sections from Agenda 21

"Indigenous people and their communities have an historical relationship with their lands and are generally descendants of the original inhabitants of such lands. In the

context of this chapter the term "lands" is understood to include the environment of the areas which the people concerned traditionally occupy. Indigenous people and their communities represent a significant percentage of the global population. They have developed over many generations a holistic traditional scientific knowledge of their lands, natural resources and environment. Indigenous people and their communities shall enjoy the full measure of human rights and fundamental freedoms without hindrance or discrimination. Their ability to participate fully in sustainable development practices on their lands has tended to be limited as a result of factors of an economic, social and historical nature. In view of the interrelationship between the natural environment and its sustainable development and the cultural, social, economic and physical well-being of indigenous people, national and international efforts to implement environmentally sound and sustainable development should recognize, accommodate, promote and strengthen the role of indigenous people and their communities." (Agenda 21, 16.1)

“ In full partnership with indigenous people and their communities, Governments and, where appropriate, intergovernmental organizations should aim at fulfilling the following objectives” (Agenda 21, 16.3)

(a) Establishment of a process to empower indigenous people and their communities through measures that include:

- (i) Adoption or strengthening of appropriate policies and/or legal instruments at the national level;
- (ii) Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate;
- (iii) Recognition of their values, traditional knowledge and resource management practices with a view to promoting environmentally sound and sustainable development;

UNCED Documents: Rio Declaration

“Indigenous people and their communities, and other local communities, have a vital role in environmental management and development because of their knowledge and traditional practices. States should recognize and duly support their identity, culture and interests and enable their effective

participation in the achievement of sustainable development.”  
( Rio Declaration, Principle 22)

“States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health.” ( Rio Declaration, Principle 14)

“In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.” (Rio Declaration, Principle 15)

“National authorities should endeavour to promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should, in principle, bear the cost of pollution, with due regard to the public interest and without distorting international trade and investment.”(Rio Declaration, Principle 16)

## **14.RESPECT FOR CULTURAL INTEGRITY AND INDIGENOUS PRACTICES**

### **13.1. RESPECT FOR CULTURAL INTEGRITY AND RIGHTS OF INDIGENOUS PEOPLE**

" respecting the cultural integrity and the rights of indigenous *people* [ PEOPLES, EDITORIAL ADDITION] and their communities ( 3.7. b )

### **14.2. RESPECTS FOR TRADITIONAL AND INDIGENOUS PRACTICES**

"Promote development in accordance with indigenous practices and adopt technologies appropriate to local conditions "(7.42 c)

the promotion of sustainable production systems such as traditional methods of agriculture, agroforestry, forestry, range and wildlife management, which use, maintain or increase biodiversity "(15.5 Biodiversity)

" consider undertaking pilot projects that combine environmental protection and development functions with particular emphasis on some of the traditional environmental management practices or systems that have a good impact on the environment "(13.21.a Fragile ecosystem)

" Collect and record information on indigenous conservation and rehabilitation practices and farming systems as a basis for research and extension programmes." (14.47 c, Agriculture)

" Governments ....should ... Recognize and foster the traditional methods and the knowledge of indigenous people and their communities, emphasizing the particular role of women, relevant to the conservation of biological diversity and the sustainable use of biological resources, and ensure the opportunity for the participation of those groups in the economic and commercial benefits derived from the use of such traditional methods and knowledge" (15.4, g Biodiversity)

" Take effective economic, social and other appropriate incentive measures to encourage the conservation of biological diversity and the sustainable use of biological resources, including the promotion of sustainable production systems, such as traditional methods of agriculture, agroforestry, forestry, range and wildlife management, which use, maintain or increase biodiversity" (15.5 d Biodiversity)

" Take effective economic, social and other appropriate incentive measures to encourage the conservation of biological diversity and the sustainable use of biological resources, including the promotion of sustainable production systems, such as traditional methods of agriculture, agroforestry, forestry, range and wildlife management, which use, maintain or increase biodiversity" (15.5 d Biodiversity)

" Take action where necessary for the conservation of biological diversity through the in situ conservation of ecosystems and natural habitats, as well as primitive cultivars and their wild relatives, and the maintenance and recover of viable populations of species in their natural surrounding ..." (15.6 g. Biodiversity)

Governments... consistent with the requirements of international law should, as appropriate collect, assess and make available relevant and reliable information in a timely manner and in a form suitable for decision-making at all levels, with the full support and participation of local and indigenous people and their communities." ( 15.6 f Biodiversity)

"promotion of collaborative research programmes... fostering of traditional methods and knowledge of such groups ( local and indigenous) in connection with these activities." (16.7 b Biotechnology)

"States shall cooperate with a view to the conservation of marine mammals and, in the case of cetaceans, shall in particular work

through the appropriate international organizations for their conservation, management and study" (17.50 Marine)

#### **15. CONDEMNATION OF TRANSFER OF ECOLOGICALLY UNSOUND PRACTICES AND PRODUCTS (CONDEMNATION OF THIRD WORLD DUMPING- INCLUDING PRODUCTS DEEMED TO BE UNSAFE IN COUNTRY OF ORIGIN)**

"States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health."(Principle 14 Rio Declaration)

Establish and enforce screening , systematic sampling and evaluation procedures for drugs and medical technologies, with a view to barring the use of those that are unsafe for the purposes of experimentation; ensure that drugs and technologies relating to reproductive health are safe and effective [ and take account of ethical considerations]" ( 16.14 c, Biotechnology)

" [ Governments of developed countries should provide a range of incentives to encourage industry to transfer environmentally sound technologies and know-how on clean technologies and low-waste production to developing countries on preferential and non-commercial terms, which would bring about changes to sustain innovation. Governments should cooperate with industry to develop guidelines and codes of conduct, leading to cleaner production through sectorial trade and industry association]" (20.13 Hazardous wastes)

" to adopt a ban on or prohibit, *as appropriate*, the export of hazardous wastes to countries that do not have the capacity to deal with those wastes in an environmentally sound way or that have banned the import of such wastes" (20.34. b. hazardous wastes)

"Implement policies for the implementation of a ban or prohibition, *as appropriate*, of exports of hazardous wastes to countries that do not have the *capacity to deal with those wastes in an environmentally sound way* or than have banned the import of such wastes" (20.39 c Hazardous wastes)

#### **DANGEROUS LOOPHOLD IN THIRD WORLD DUMPING**

" Develop regulatory and non-regulatory measures and procedures aimed at preventing the export of chemicals that are banned, severely restricted, withdrawn or not approved for health or environmental reasons, except when such export has received prior written consent from the importing country or is otherwise in accordance with the PIC procedure," (19.53 f Toxic chemicals)

## TO BE COMPLETED

3.7. b. combating poverty 6.19 health  
SPECIFIC REFERENCE TO WOMEN  
11.4.b ,14.17` , 14.18 b.

## GENDER6.19 health

" governments recognize that there is a new global effort to relate the elements of the international economic system and mankind's need for a safe and stable natural environment... "( 2.4. Social and economic dimensions)  
"However, conserving and rehabilitating the natural resources on lower potential lands in order to maintain sustainable man/land rations is also necessary. (14.3 Agriculture)

## COMMUNITY CONTROL

" Governments, in cooperation with appropriate international and non-governmental organization, should support a community-driven approach to sustainability, which would be included, inter alia:

E3.7 d  
14.16

## SPECIFIC REFERENCE TO NGO

13.16 d; CHAPTER 27

## INTERDISCIPLINARY

13.22 a

## PARTICIPATION

14.4.b

" Long-term research into the importance of biodiversity for the functioning of ecosystems and the role of ecosystems in producing good, environmental services and other values supporting sustainable development with particular reference to the biology and reproductive capacities of key terrestrial and aquatic species, including native, cultivated and cultured species; ? observation and inventory techniques; ecological conditions necessary for biodiversity conservation and continued evolution; and social behaviour and nutrition habits dependent on natural ecosystems, where women play key roles. The work should be undertaken with the widest possible participation, especially of indigenous people and their communities, including women." ( 15.5 f, Biological diversity)

## LAND TENURE

## CONDITIONS

Additional financial resources in favour of developing countries are essential . The U. S. changed this " the availability of additional external resources will increase as foreign entities are convinces that such resources will generate a positive result and efficient utilization of such resources can be demonstrated." (2.24 Social and economic)

## RESPONSIBILITY

(" Governments should establish regulations that lay down the ultimate responsibility of industries for environmentally sound disposal of the hazardous wastes their activities generate." ???20.13 k. Hazardous wastes) 14.46

## MILITARY

" [Governments should ascertain whether their military establishments conform to strict environmental norms in the treatment and disposal of hazardous wastes.] (20.23 Hazardous wastes)

(h) Governments should ascertain that their military establishments conform to their nationally applicable environmental norms in the treatment and disposal of hazardous wastes.20.22

## **PART 2 PRINCIPLES OF ACTION EXTRACTED FROM INTERNATIONAL DOCUMENTS (PARTICULARLY AGENDA 21)**

### 2.2.PRINCIPLES OF ACTION

The following principles have been extracted from a series of international documents, including Stockholm Convention 1972, the World Charter of Nature, 1992, and UNCED documents. and the Rights of the Child. These principles will be combined with those extracted from UN Declaration of Human Rights and international Covenants {diagram from Russow, J ( 1985), "A diagram of rights that are or are not protected through international documents"}. The delineation of principles is in progress. The proposed format will be the extracting of the principle from the documents, the naming of the principle, the abstract definition of the principle, and the citation from the international document that supports the principle.

#### Responsible-care-linked-to-life-cycle principle

This principle involves the recognition that responsible care is dependent upon the revealing of the full environmental impact of each stage of the life cycle of the product or substance

"Industry should be encouraged to develop application of a 'responsible care' approach by producers and manufacturers towards chemical products, taking into account the total life cycle of such products" ( Agenda 21, 19.51 b.)

#### Positive-duty-to-protect human rights principles

"Indigenous people and their communities shall enjoy the full measure of human rights and fundamental freedoms without hindrance or discrimination." (Agenda 21, 16.1)

#### Positive-duty-to-protect principle

"Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate; recommendations" (Agenda 21, 16.3 ii)

Positive-duty-to-protect-from-activities-that-are-environmentally-unsound principle

“Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate; recommendations” (Agenda 21, 16.3 ii)

Positive-duty-to-protect-from-activities-that-are-culturally-inappropriate principle

“Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate; recommendations” (Agenda 21, 16.3 ii)

Positive-duty-or-responsibility principle

“The responsibility to conserve their biodiversity and use their biological resources sustainably, and to ensure that activities within their jurisdiction or control do not cause damage to the biological diversity of other states or of areas beyond the limits of national jurisdiction. ” (Agenda 21, 15.3 )

Prevention-through-effective-enforcement principle

“Effective prevention requires action through effective monitoring and the enforcement and imposition of appropriate penalties ”( Agenda 21, 20.20)

Prevention-through-effective-enforcement principle

“Effective prevention requires action through effective monitoring and the enforcement and imposition of appropriate penalties ”( Agenda 21, 20.20)

Prevention-through-imposition-of appropriate-penalties principle

“Government international and regional organization and industry should facilitate and expand the dissemination of technical and scientific information dealing with the various health aspects of hazardous wastes”  
(Agenda 21, 20.22)

Revelation-of-health-impact principle

“Government international and regional organization and industry should facilitate and expand the dissemination of technical and scientific information dealing with the various health aspects of hazardous wastes” (Agenda 21, 20.22)

Dissemination-of-technical-information-dealing-with-the-health-aspects principle

“Government international and regional organization and industry should facilitate and expand the dissemination of technical and scientific information dealing with the various health aspects of hazardous wastes” (Agenda 21, 20.22)

Dissemination of scientific-information-dealing-with-the-health-aspects principle

“Government international and regional organization and industry should facilitate and expand the dissemination of technical and scientific information dealing with the various health aspects of hazardous wastes” (Agenda 21, 20.22)

Not-transferring-environmentally-harmful-activities-or-substances principle

“States should effectively cooperate to discourage or prevent the relocation and transfer to other states of any activities and substances that cause severe environmental degradation or are found to be harmful to human health” ( Principle 14, Rio Declaration)

Root-cause-change principle

“Environmentally sound waste management must go beyond the mere safe disposal or recovery of wastes that are generated and seek to address the root cause of the problem by attempting to change unsustainable patterns of production and consumption ”( Agenda 21 )

Significant-causal-interdependence principle

Possible reduction of resilience of ecosystem to climatic variation because of loss of biological diversity principle

" The loss of biological diversity may reduce the resilience of ecosystems to climatic variations and air pollution damage. Atmospheric changes can have important impacts on forests, biodiversity, and freshwater and marine ecosystems, as well as on economic activities, such as agriculture." (Agenda 21, 9.16 )  
cross link with clear cut

Linking-of-environmental-degradation-and-environmentally-harmful mismanagement

“Forests worldwide have been and are being threatened by uncontrolled degradation and conversion to other types of land uses, influenced by increasing human needs; agricultural; expansion, and environmentally harmful mismanagement, including, for example...unsustainable commercial logging... and the impact of loss and degradation of forests are in the form of soil erosion; loss of biological diversity, damage to wildlife habitats and degradation of watershed areas, deterioration of

the quality of life and reduction of options for development”  
(Agenda 21, 11.12)

Overuse-avoidance principle

"Chemical control of agricultural pests has dominated the scene, but its overuse has adverse effects on farm budgets, human health and the environment..."(Agenda 21, 14.74 )

Adverse-environmental-effects-of-overuse-of-chemicals principle

"Chemical control of agricultural pests has dominated the scene, but its overuse has adverse effects on farm budgets, human health and the environment..."(Agenda 21, 14.74 )

Ecologically-unsound-practices-accumulation-impact principle

" Despite mounting efforts over the past 20 years, the loss of the world' biological diversity, mainly from habitat destruction, over-harvesting, pollution and the inappropriate introduction of foreign plants and animals has continued." ( Agenda 21, 15.3 )

Multiple-cause-destruction principle

"The environment is threatened in all its biotic and abiotic components: animals, plants, microbes and ecosystems comprising biological diversity; water, soil and air, which form the physical components of habitats and ecosystem; and all the interactions between the components of biodiversity and their sustaining habitats and ecosystem. With the continued increase in the use of chemicals, energy and non-renewable resources by expanding global population, associated environmental problems will also increase. Despite increasing efforts to prevent waste accumulation and to promote recycling, the amount of environmental damage caused by over-consumption, the quantities of waste generated and the degree of unsustainable land use appear likely to continue growing."  
(Agenda 21, 16.22 )

Linking-of-environmental-damage-caused-by-overconsumption-principle

"Despite increasing efforts to prevent waste accumulation and to promote recycling, the amount of environmental damage caused by over-consumption, the quantities of waste generated and the degree of unsustainable land use appear likely to continue growing." (Agenda 21, 16.22 )

Multiple-unforeseen-consequence principle

"Poor land-use management, including deforestation and non-sustainable agriculture, mining and urbanization, could lead to a considerable increase in erosion problems and related soil loss in the river basins. The sedimentation in large reservoirs may have serious adverse effects downstream by reducing the quantity of natural nutrients available to agricultural land and coastal waters. .. Acidification of surface waters and

groundwaters due to atmospheric deposition of air pollutants can lead to depletion of freshwater living resources and thereby contribute to the loss of biodiversity.” (Agenda 21, 18.3 )

“Major problems affecting the water quality of rivers and lakes arise, in variable order of importance according to different situations, from inadequately treated domestic sewage, inadequate controls on the discharges of industrial waste waters, loss and destruction of catchment areas, ill-considered siting of agricultural practices. This gives rise to the leaching of nutrients and pesticides. Aquatic ecosystems are disturbed and living freshwater resources are threatened. ...Erosion, degradation , deforestation and desertification have led to increased land degradation, and the creation of reservoirs has, in some cases, resulted in adverse effects on ecosystems.”(Agenda 21,18.45 )

#### Attribution-of-causal-connection principle

“Many of these problems have arisen from a development model that is environmentally destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems.” (Agenda 21, 18.45 )

#### Prevention-to-avoid-subsequent-measures-to-rehabilitate principle

“A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies.” (Agenda 21, 18.45 )

#### Assessment-of-direct-and-indirect-costs principle

“Human health and environmental quality are undergoing continuous degradation by the increasing amount of hazardous wastes being produced. there are increasing direct and indirect costs to society and to individual citizens in connection with the generation, handling and disposal of such wastes. ” (Agenda 21, 20.9 )

#### Linking of degradation-of-human-health-and-environmental-quality-with-increasing-amount-of-hazardous-wastes principle

“ Human health and environmental quality are undergoing continuous degradation by the increasing amount of hazardous wastes being produced. there are increasing direct and indirect costs to society and to individual citizens in connection with the generation, handling and disposal of such wastes.” (Agenda 21, 20.9 )

Unprecedented-increase-in-environmentally-persistent-wastes principle

“Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally persistent wastes at unprecedented rates. The trend could significantly increase the quantities of wastes produced by the end of the century and increase quantities four to fivefold by the year 2025.”(Agenda 21, 21.7)

Condemnation-of-illegal-trafficking principle

“...illegal traffic in toxic and dangerous products ( toxic and dangerous products are those that are banned, severely restricted, withdrawn or not approved for use of sale by governments in order to protect public health and the environment). see resolutions 42/183 and uu/226 ”(Agenda 21, 19.67)

Limiting-harmful-anthropogenic-activities principle

“...the objectives of this programme area are: reducing atmospheric pollution or limiting anthropogenic emissions of greenhouse gases”  
(Agenda 21, 9)

“Linking-of-unsustainable-production-and-consumption-and- unprecedented-increase-in-environmentally-persistent-wastes principle

Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally persistent wastes at unprecedented rates. The trend could significantly increase the quantities of wastes produced by the end of the century and increase quantities four to fivefold by the year 2025.” (Agenda 21, 21.7)

“Ecological-and-human-health-effects-measurable-consequences-of - environmentally-destructive-model principle

Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems”. (Agenda 21, 18.45 )

“Measurability-of-ecological-and-health-consequences principle

Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences...” (Agenda 21, 18.45 )

“Change-in-lifestyle- trend-reversal principle

A preventive waste management approach focused on changes in lifestyles and in production and consumption patterns offers the best change for reversing current trends” (Agenda 21, 21.7 )

“Reorientation-of-consumption-patterns principle

Achieving the goals of environmental quality and sustainable development will require efficiency in production and changes in consumption patterns in order to emphasize optimization of resource use and minimization of waste. In many instances, this will require reorientation of existing production and consumption patterns that have developed in industrial societies and are in turn emulated in much of the world.” (Agenda 21, 4.15)

“Promotion-of-alternative-models-of-consumption-to-reduce- environmental-stress principle

to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity” (Agenda 21, 4.7.a )

“Promotion-of-alternative-models-of-consumption-to-meet-basic-needs-of-humanity principle

to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity ”(Agenda 21, 4.7.a )

“Prohibition-of-harmful-substances principle

Considering the prohibition of those(harmful pesticides, fertilizers) found to be environmentally unsound” (Agenda 21, 17.28. i)

“Prohibition-of-environmentally-unsound-substances principle

Considering the prohibition of those(harmful pesticides, fertilizers) found to be environmentally unsound” (Agenda 21, 17.28. i)

“Elimination-of-accumulation-to-dangerous-levels principle

eliminating the emission or discharge of organohalogen compounds that threaten to accumulate to dangerous levels in the marine environment”  
( Agenda 21, 17.28 )

“Phasing-out -unmanageable-risk principle

And the phasing out or banning of toxic chemicals that pose an unreasonable and otherwise unmanageable risk to the environment or human health and those that are toxic, persistent and bio-accumulative and whose use cannot be adequately controlled” (Agenda 21, 19.50 b)

“Phasing-out -unreasonable risk principle

And the phasing out or banning of toxic chemicals that pose an unreasonable and otherwise unmanageable risk to the environment or human health and those that are toxic, persistent and bio-accumulative and whose use cannot be adequately controlled” (Agenda 21, 19.50 b)

“Banning-of-unmanageable-risk principle

And the phasing out or banning of toxic chemicals that pose an unreasonable and otherwise unmanageable risk to the environment or human health and those that are toxic, persistent and bio-accumulative and whose use cannot be adequately controlled ”(Agenda 21, 19.50 b)

“Phasing-out-unreasonable-risk principle

And the phasing out or banning of toxic chemicals that pose an unreasonable and otherwise unmanageable risk to the environment or human health and those that are toxic, persistent and bio-accumulative and whose use cannot be adequately controlled” (Agenda 21, 19.50 b)

“Replacement-of-safe-alternative principle

Governments should intensify research and development activities on cost-effective alternatives for processes and substances that currently result in the generation of hazardous wastes that pose particular problems for environmentally sound disposal or treatment, the possibility of ultimate phase-out of those substances that present an unreasonable or otherwise unmanageable risk and are toxic, persistent and bio-accumulative to be considered as soon as practicable.” *Emphasis should be given to alternatives that could be economically accessible to developing countries* ???(Agenda 21, 20.13. c )

Promotion-of-phase-out-of-risk research principle

" States, with the cooperation of international organizations *where appropriate*, should encourage industry to promote and undertake research into the phase-out of the processes that pose the greatest environmental risk based on hazardous wastes generated.” (Agenda 21, 20.18 b )

Mandate-to-supply-basic-needs principle

" As a first step towards the goal of providing adequate shelter for all, all countries should take immediate measures to provide shelter to their homeless poor, while the international community and financial institutions should undertake actions to support efforts of the developing countries to provide shelter to the poor.” (Agenda 21, 7.9. )

" Promote cooperation between the parties to relevant international conventions and action plans with the aim of strengthening and coordinating efforts to conserve biological diversity and the sustainable use of biological resources." (Agenda 21,15.8 e.)

"Strengthen-support-for-international-and-regional-instruments principle programmes and action plans concerned with the conservation of biological diversity and the sustainable use of biological resources." (Agenda 21, 15.8 f)

"Determination-of-guidelines-for-acceptable-exposure principle to produce guidelines for *acceptable* exposure for a greater number of toxic chemicals, based on peer review and scientific consensus distinguishing between health or environment based exposure limits and those relating to socio-economic factors." (Agenda 21, 19.13 b.)

"Distinction-of-guidelines-for-health-or-environment-based-exposure-limits principle to produce guidelines for *acceptable* exposure for a greater number of toxic chemicals, based on peer review and scientific consensus distinguishing between health or environment based exposure limits and those relating to socio-economic factors". (Agenda 21, 19.13 b.)

"Internationally-agreed-code principle  
" Develop an internationally agreed upon code of principles for the management of trade in chemicals, recognizing in particular the responsibility for making available information on potential risks and environmentally sound disposal practices if those chemicals become wastes, in cooperation with governments and relevant international organizations and appropriate agencies of the United Nations system" (19.51 Toxic chemicals)

"Costs-and-benefits-guideline-formation principle  
" A relevant and competent United Nations organization should take the lead, in cooperation with other organizations, to develop guidelines for estimating the costs and benefits of various approaches to the adoption of cleaner production and waste minimization and environmentally sound management of hazardous wastes, including rehabilitation of contaminated sites "(see 1991 Nairobi meeting and Basel Convention) (20.13. j, Hazardous wastes)

"Harmonization-of-criteria-[[harmonizing up to highest standard]] principle  
There is a need to harmonize the procedures and criteria used in various international and legal instruments. There is also a need to develop or *harmonize* existing criteria for identifying

wastes dangerous to the environment and to build monitoring capacities.”(Agenda 21, 20.33)

“Promotion-of-clear-guidelines principle

" Promote the development of clear criteria and guidelines, within the framework of the Basel Convention and regional conventions, *as appropriate*, for environmentally and *economically sound* operation in resource recovery, recycling reclamation, direct use of alternative uses and for determination of acceptable recovery practices, including recovery levels where feasible and appropriate, with a view to preventing abuses and false presentation in the above operations.”  
(Agenda 21, 20.35 e )

“Internationally-agreed-principle-on-risk-assessment principle

" There is a need for further development of internationally agreed principles on risk assessment and management of all aspects of biotechnology which should build upon those developed at the national level.” (Agenda 21, 16.32 )

“Ethical-consideration-principle ( also 16.16 a and b)

"Governments at the appropriate level, with the assistance of international and regional organizations, academic and scientific institutions and the pharmaceutical industry, should taking into account appropriate safety and ethical considerations” (Agenda 21, 16.14)

“Need-to-take-into-account-appropriate-safety principle

"Governments at the appropriate level, with the assistance of international and regional organizations, academic and scientific institutions and the pharmaceutical industry, should taking into account appropriate safety and ethical considerations” (Agenda 21, 16.14)

Precautionary principle

" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.” ( Rio Declaration, 1992).

Preventive-precautionary-and-anticipatory-approach principle

" apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it; ”(Agenda 21, 17.23 a )

Reduction-of-long-term-risk-or-irreversible-adverse-effects principle

" apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as

to reduce the risk of long-term or irreversible adverse effects upon it;”(Agenda 21, 17.23 a )

Precautionary-and-anticipatory-rather-than-reactive principle

" a precautionary and anticipatory rather than a reactive approach is necessary to prevent the degradation of the marine environment”.

Anticipatory-linked-with-clean-production-techniques principle

Anticipatory-linked-with-environmental-impact-assessment principle

“This requires inter alia, the adoption of precautionary measures, environmental impact assessments, clean production techniques, recycling, waste audits and minimization, construction and/or improvements of sewage treatment facilities, quality management criteria for the proper handling of hazardous substances, and a comprehensive approach to damaging impacts from air, land and water” (Agenda 21, 17.22.)

Anticipatory-and-life-cycle-approach principle

"consider adopting policies based on accepted producer liability principles, where appropriate, as well as precautionary, anticipatory and life-cycle approaches to chemical management, covering manufacturing, trade, transport, use and disposal ” (Agenda 21, 19.50 a )

Producer-liability principle

"consider adopting policies based on accepted producer liability principles, where appropriate, as well as precautionary, anticipatory and life-cycle approaches to chemical management, covering manufacturing, trade, transport, use and disposal ” (Agenda 21, 19.50 a )

Producer-liability based policy principle

"consider adopting policies based on accepted producer liability principles, where appropriate, as well as precautionary, anticipatory and life-cycle approaches to chemical management, covering manufacturing, trade, transport, use and disposal ” (Agenda 21, 19.50 a )

Foresight principle

"Each country should develop the knowledge and practical skills to foresee and identify environmental health hazards, and the capacity to reduce the risks. Basic capacity requirements must include knowledge about environmental health problems and awareness on the part of leaders, citizens and specialists...” (Agenda 21, 6.46 d )

Develop-knowledge-skills-to-foresee-environmental-hazards principle  
"Each country should develop the knowledge and practical skills to foresee and identify environmental health hazards, and the capacity to reduce the risks. Basic capacity requirements must include knowledge about environmental health problems and awareness on the part of leaders, citizens and specialists..."(Agenda 21, 6.46 d )

Develop-knowledge-skills-to-identify-environmental-hazards principle  
"Each country should develop the knowledge and practical skills to foresee and identify environmental health hazards, and the capacity to reduce the risks. Basic capacity requirements must include knowledge about environmental health problems and awareness on the part of leaders, citizens and specialists..."  
(Agenda 21, 6.46 d )

Develop-capacity-to-reduce-risks principle  
"Each country should develop the knowledge and practical skills to foresee and identify environmental health hazards, and the capacity to reduce the risks. Basic capacity requirements must include knowledge about environmental health problems and awareness on the part of leaders, citizens and specialists..."  
(Agenda 21, 6.46 d )

Culture-of-safety Principle  
This principle involves the commitment to act to prevent rather than to [correct]  
"to promote a 'culture of safety' in all countries, especially those that are disaster-prone, the following activities should be carried out:" (Agenda 21, 7.60)

Responsible-care-principle  
Industry should be encouraged to develop application of a 'responsible care' approach by producers and manufacturers towards chemical products, taking into account the total life cycle of such products" ( Agenda 21, 19.51 b.)

Responsible-care-linked-to-life-cycle principle  
This principle involves the recognition that responsible care is dependent upon revealing of life cycle of products  
"Industry should be encouraged to develop application of a 'responsible care' approach by producers and manufacturers towards chemical products, taking into account the total life cycle of such products "( Agenda 21, 19.51 b.)

Concept-of-environmental-care principle...  
"Empower community groups, non-governmental organizations and individuals to assume the authority and responsibility for

managing and enhancing their immediate environment through participatory tools, techniques and approaches embodied in the concept of environmental care.” (Agenda 21, 7.21. g)

#### Empowerment-of-community-groups principle

“Empower community groups, non-governmental organizations and individuals to assume the authority and responsibility for managing and enhancing their immediate environment through participatory tools, techniques and approaches embodied in the concept of environmental care.” (Agenda 21, 7.21. g)

#### Preventive-to avoid-costly-corrective-measures principle

“A preventive approach, where appropriate,. is crucial to the avoiding of costly subsequent measures to rehabilitate treat and develop new water supplies. ”(Agenda 21, 18.45 )

#### Avoidance-of-costly-corrective-measures principle

“A preventive approach, where appropriate,. is crucial to the avoiding of costly subsequent measures to rehabilitate treat and develop new water supplies.” (Agenda 21, 18.45 )

#### Cradle-to-grave-approach monitoring principle

This principle involves the recognition that governments have the responsibility for monitoring through the cradle to grave approach

“Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits” (Agenda 21, 20.20 e )

#### Monitoring-through-Cradle-to-grave-approach principle

This principle involves the recognition that governments have the responsibility for monitoring through the cradle to grave approach

“Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits” (Agenda 21, 20.20 e )

#### Lead-to-be-taken-by-government-to-establish environmental assessment principle

“Governments should take the lead in establishing and strengthening, as appropriate, national procedures for environmental impact assessment, taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction” (Agenda 21, 20.20 e )

#### Lead-to-be-taken-by-government-in-minimizing-the-generation-of-environmental-wastes principle

“Governments should take the lead in establishing and strengthening, as appropriate, national procedures for environmental impact assessment, taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction” (Agenda 21, 20.20 e )

**Cradle-to-grave-approach-impact-assessment principle**

“Governments should take the lead in establishing and strengthening, as appropriate, national procedures for environmental impact assessment, taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction ”(Agenda 21, 20.20 e )

**Environmental-impact-assessment principle**

" Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the assessment of the impacts of relevant policies and programmes on biological diversity” (Agenda 21, 15.5 k)

**Mandate-to-assess-impacts-of-policies-on-biodiversity principle**

" Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the assessment of the impacts of relevant policies and programmes on biological diversity” (Agenda 21, 15.5 k)

**Mandate-to-assess-impacts-of-programs-on-biodiversity principle**

" Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the assessment of the impacts of relevant policies and programmes on biological diversity” (Agenda 21, 15.5 k)

**Entire-life-cycle-risk-reduction principle**

This principle involves the recognition that only through examining the full life cycle of a product can the risk be reduced "risk reduction involves broad-based approaches to reducing the risks of toxic chemicals, taking into account the entire life cycle of the chemicals.” (Agenda 21,19.45, )

**Prior-assessment-of potential-adverse-impacts principle**

" Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment;” (Agenda 21,17.23 b )

Prior-assessment-in-decision-making-principle

“Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences” (Agenda 21,7.42)

Mandate-in-decision-making-to-take-into-account-costs-of-ecological-consequences principle

“Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences” (Agenda 21,7.42)

Environmental-awareness-and-understanding-dissemination principle

" Development of public education programmes directed at decision makers and the general public to encourage awareness and understanding of the relative benefits and risks of modern biotechnology, according to ethical and cultural considerations." (Agenda 21,16.16 b)

Standards-no-less-than-country-of origin-principle

(" Wherever they operate, transnational corporations and other large-scale enterprises should be encouraged to introduce policies and make commitments to adopt standards of operation with reference to hazardous waste generation and disposal that are equivalent to or no less stringent than standards in the country of origin, and Governments are invited to make efforts to establish regulations requiring environmentally sound management of hazardous wastes. "(Agenda 21,20.30 )

Mandate-for-transnational-to make-commitments-to-adopt standards-of-operation-no-less-stringent-than-country-of-origin principle

(" Wherever they operate, transnational corporations and other large-scale enterprises should be encouraged to introduce policies and make commitments to adopt standards of operation with reference to hazardous waste generation and disposal that are equivalent to or no less stringent than standards in the country of origin, and Governments are invited to make efforts to establish regulations requiring environmentally sound management of hazardous wastes." (Agenda 21,20.30 )

Mandate-to-government-to-establish-regulations-requiring- environmental-source-management principle

(" Wherever they operate, transnational corporations and other large-scale enterprises should be encouraged to introduce policies and make commitments to adopt standards of operation with reference to hazardous waste generation and disposal that are equivalent to or no less stringent than standards in the country of origin, and Governments are invited to make efforts to establish regulations requiring environmentally sound management of hazardous wastes." (Agenda 21,20.30 )

#### Polluter-pay principle

“Governments should include in national planning and legislation an integrated approach to environmental protection, driven by prevention and source reduction criteria, taking into account the 'polluter pays' principle, and adopt programmes for hazardous waste reduction, including targets and adequate environmental control” (Agenda 21,20.20 b)

#### Polluter-pay principle

" Governments, *according to their capacities and available resources* and with the cooperation of the UN and other relevant organization, *as appropriate* should make recommendations to the appropriate forums or establish or adapt norms, including the *equitable* implementation of the polluter pays principle” (Agenda 21,20.39 b )

#### Treat-at-source principle

##### **Inadequate sewage treatment (see marine 17.28)**

"promoting primary treatment of municipal sewage discharged to rivers, estuaries and the sea, or other solutions appropriate to specific sites” ( Agenda 21,17.28 e )

#### Minimize-or-avoid-environmental-damage principle

“Adopt policies that minimize if not altogether avoid environmental damage, whenever possible” (Agenda 21, 7.42 a )

#### Mandate-to-adopt-policies-to-minimize-or-avoid-environmental-damage principle

“Adopt policies that minimize if not altogether avoid environmental damage, whenever possible” (Agenda 21, 7.42 a )

#### “Substitution-of-less-harmful principle

there are often alternatives to toxic chemicals currently in use. Thus risk reduction can sometimes be achieved by using other chemicals or even non-chemical technologies. The classic example of risk reduction is the substitution of harmless or less harmful substances for harmful ones. establishment of pollution prevention procedures and setting standards for chemicals in each environmental medium, including food and water, and in consumer goods, constitute another example of risk reduction” (Agenda 21,19.45 )

#### “Risk-reduction-through-substitution-of-harmless-or-less-harmful principle

there are often alternatives to toxic chemicals currently in use. Thus risk reduction can sometimes be achieved by using other chemicals or even non-chemical technologies. The classic example of risk reduction is the substitution of harmless or less harmful substances for harmful ones. establishment of pollution prevention procedures and setting standards for chemicals in

each environmental medium, including food and water, and in consumer goods, constitute another example of risk reduction” (Agenda 21,19.45 )

#### Mandate-to-establish-pollution-prevention-procedures principle

“There are often alternatives to toxic chemicals currently in use. Thus risk reduction can sometimes be achieved by using other chemicals or even non-chemical technologies. The classic example of risk reduction is the substitution of harmless or less harmful substances for harmful ones. establishment of pollution prevention procedures and setting standards for chemicals in each environmental medium, including food and water, and in consumer goods, constitute another example of risk reduction” (Agenda 21,19.45 )

#### Setting -standards-means-to-risk-reduction principle

There are often alternatives to toxic chemicals currently in use. Thus risk reduction can sometimes be achieved by using other chemicals or even non-chemical technologies. The classic example of risk reduction is the substitution of harmless or less harmful substances for harmful ones. establishment of pollution prevention procedures and setting standards for chemicals in each environmental medium, including food and water, and in consumer goods, constitute another example of risk reduction (Agenda 21,19.45 )

#### Root-cause-change principle

“ Environmentally sound waste management must go beyond the mere safe disposal or recovery of wastes that are generated and seek to address the root cause of the problem by attempting to change unsustainable patterns of production and consumption.” (Agenda 21,21.4)

#### Root-cause-linked-to-unstustainable-patterns-of-production-and-consumption principle

“ Environmentally sound waste management must go beyond the mere safe disposal or recovery of wastes that are generated and seek to address the root cause of the problem by attempting to change unsustainable patterns of production and consumption.” (Agenda 21,21.4)

#### Conservation-of-sinks principles

“ the conservation, sustainable management and enhancement, where appropriate, of all sinks for greenhouse gases; ”(Agenda 21,9.17 ii )

#### Positive-mandate-to-serve principle

Mandate-to -serve-traditional-forest-habitat-of indigenous-peoples principle

Mandate-to-serve-forest-habitat-of local-communities principle

Mandate-to-establish-national-protected-area-system principle  
Mandate-to-expand-national-protected-area-systems principle  
Mandate-to- conserve-for-environmental-values principle  
Mandate-to- conserve-for-social-values principle  
Mandate-to- conserve-for-spiritual-values principle  
Mandate-to- conserve-genetic-resources principle  
Mandate-to- conserve-representative-ecological-systems principle  
Mandate to conserve-

" Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources, involving in situ and ex situ measures and undertaking supportive measures to ensure sustainable utilization of biological resources and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities;" (Agenda 21, 11.15 b)

Positive-mandate-to-improve-the conservation principle

" The objectives and activities in this chapter of Agenda 21 are intended to improve the conservation of biological diversity and the sustainable use of biological resources." (Agenda 21,15.1)

Positive mandate to conserve biological diversity principle

" The objectives and activities in this chapter of Agenda 21 are intended to improve the conservation of biological diversity and the sustainable use of biological resources." (Agenda 21,15.1)

Mandate -to-take-economic-social-incentive measures to encourage conservation of biodiversity principle

" take effective economic, social and other appropriate incentive measures to encourage the conservation of biological diversity and the sustainable use of biological resources, including the promotion of sustainable production systems such as traditional methods of agriculture, agroforestry, forestry, range and wildlife management, which use, maintain or increase biodiversity "(Agenda 21,15.5 )

Positive-mandate-to-be-consistent with requirements of international law principle

" Governments... and consistent with the requirements of international law should, as appropriate Identify and evaluate the potential economic and social implications and benefits of the conservation and sustainable use of terrestrial and aquatic

species in each country, building upon the results of country studies” (Agenda 21,15.6.)

Positive-mandate-to-identify and evaluate-potential-economic-social implications and benefits of Conservation principle

" Governments... and consistent with the requirements of international law should, as appropriate Identify and evaluate the potential economic and social implications and benefits of the conservation and sustainable use of terrestrial and aquatic species in each country, building upon the results of country studies” (Agenda 21,15.6.)

Mandate-to conserve and restore of altered critical habitats principle

" conservation and restoration of altered critical habitats” (Agenda 21, 17.6 h. )

Recognition of non-damaging use value principle

Consideration-of-possibility-of-increasing-value-of-forests-through-non-damaging -uses principle

Mandate-for action-to increase-people's-perception-of-non-damaging-uses-of-forests principle

" the implications of the harvesting of forest resources for the other values of the forest should be taken fully into consideration in the development of forest policies. It is also possible to increase the value of forests through non-damaging uses such as eco-tourism and the managed supply of genetic materials. Concerted action is needed in order to increase people's perception of the value of forests and of the benefits they provide.” (Agenda 21, 11.22)

Positive-mandate-to-respect-indigenous practices principle

Mandate to emphasize in pilot project traditional environmental practices

" consider undertaking pilot projects that combine environmental protection and development functions with particular emphasis on some of the traditional environmental management practices or systems that have a good impact on the environment ”(Agenda 21, 13.21.a )

Positive mandate to utilize and produce [safe and] sound technology principle

Mandate-to-utilize-environmentally [safe and sound]renewable energy sources

Increase-use-of-environmentally [safe and sound] renewable resources principle

"cooperate to increase the availability of capacity, capabilities and relevant technologies-recognizing that technology includes biotechnology--in developing countries for utilizing and producing environmentally [safe and] sound renewable energy resources, such as solar, wind, geothermal, hydropower and biomass, including wood-fuel resource. Each resource should

be utilized in a manner that fosters sustainable development and minimizes environmental stress and health impacts, emphasizing the need for easily available, cleaner burning, smoke-free household fuel.” (Agenda 21, 9.9 g )

Positive mandate to plan and develop more efficient and less polluting principle

" "to plan and develop [safe and ] more efficient and less polluting transportation systems, especially mass transit to support economic development efforts in an environmentally [safe and] sound way, giving special attention to urban and metropolitan areas.” (Agenda 21, 9.11.b)

Mandate-for-positive-long-term-research-into-biodiversity- in ecosystems principle

Importance-of-biodiversity-for-functioning-of-ecosystem principle

Mandate to determine ecological conditions for biodiversity conservation principle

Participation of indigenous people[s] and their communities in long-term-research -into biodiversity principle

" Long-term research into the importance of biodiversity for the functioning of ecosystems and the role of ecosystems in producing good, environmental services and other values supporting sustainable development with particular reference to the biology and reproductive capacities of key terrestrial and aquatic species, including native, cultivated and cultured species; ? observation and inventory techniques; ecological conditions necessary for biodiversity conservation and continued evolution; and social behaviour and nutrition habits dependent on natural ecosystems, where women play key roles. The work should be undertaken with the widest possible participation, especially of indigenous people and their communities, including women. ” ( Agenda 21, 15.5 f,)

Promotion of environmentally sound technology research principle

"promoting research and development in environmentally sound technologies” (Agenda 21, 4.18 b )

" in rural areas, unsustainable practices, such as the exploitation of marginal lands and the encroachment on forests and ecologically fragile areas by commercial interests and landless rural populations, result in environmental degradation, as well as in diminishing returns for impoverished rural settlers. ” ( Agenda 21, 7.28 2.)

Promotion of assessment and-observation-by-non-vested-interest-groups principle

“Governments and institutions, in collaboration where necessary with appropriate international agencies and organizations, Universities and non-governmental organizations should

undertake assessments and systematic observations of forests and related programmes and processes with a view to their continuous improvement.” (Agenda 21, 11.34 )

Determination of Guidelines-for-acceptable-exposure-by-peer-review-and-scientific- consensus principle

Guidelines for -acceptable-exposure-based-on-peer-review and scientific-consensus principle

to produce guidelines for *acceptable* exposure for a greater number of toxic chemicals, based on peer review and scientific consensus distinguishing between health or environment based exposure limits and those relating to socio-economic factors. (Agenda 21, 19.13 b.)

Responsibility-of-community-and-individuals-participation principle

“Empower community groups, non-governmental organizations and individuals to assume the authority and responsibility for managing and enhancing their immediate environment through participatory tools, techniques and approaches embodied in the concept of environmental care.” (Agenda 21, 7.21. g )

Transparency-of-operations-of-industry principle

“Governments should encourage industries to be transparent in their operations and provide relevant information to the communities that might be affected by the generation, management and disposal of hazardous wastes” (Agenda 21, 20.14 f )

Mandate-to -encourage-Industry-to-provide-relevant-information principle

“Governments should encourage industries to be transparent in their operations and provide relevant information to the communities that might be affected by the generation, management and disposal of hazardous wastes” (Agenda 21, 20.14 f )

Community-right-to-know principle

“Industry should be encouraged to: adopt, on a voluntary basis, community right-to-know programmes based on international guidelines, including sharing of information on causes of accidental and potential releases and means of preventing them and reporting on annual routine emissions of toxic chemicals to the environment in the absence of host country requirements. ”( Agenda 21, 19.51 c )

“International-guidelines-for-community-right-to-know principle

Industry should be encouraged to: adopt, on a voluntary basis, community right-to-know programmes based on international guidelines, including sharing of information on causes of

accidental and potential releases and means of preventing them and reporting on annual routine emissions of toxic chemicals to the environment in the absence of host country requirements.”  
( Agenda 21, 19.51 c )

“Host-country-right-to-know principle

Industry should be encouraged to: adopt, on a voluntary basis, community right-to-know programmes based on international guidelines, including sharing of information on causes of accidental and potential releases and means of preventing them and reporting on annual routine emissions of toxic chemicals to the environment in the absence of host country requirements.”  
( Agenda 21, 19.51 c )

“Community-right-to-know-based international guidelines principle

Industry should be encouraged to: adopt, on a voluntary basis, community right-to-know programmes based on international guidelines, including sharing of information on causes of accidental and potential releases and means of preventing them and reporting on annual routine emissions of toxic chemicals to the environment in the absence of host country requirements”.  
( Agenda 21, 19.51 c )

All life in interconnected and interdependent in ways that will never be fully understood through science (Susuki)

"We are Earth, the people, plants and animals;  
the rains and the oceans; the breath of the forests and the life of the sea"

In our quest to see ourselves as separate and even above the web of life we have imperiled the delegate balance

We have contaminated the air, water and soil and driven wild things to extinction, dammed rivers, torn down ancient forests, poisoned the rains and ripped holes in the sky"

Since the first United Nations Conference on the Environment in Stockholm in 1972 we have come to realize that the threats to the biosphere which sustains all life on this planet have increased in rate, magnitude and scale that inaction

is negligent. The international community has enough information about the pending state of ecological irreversibility that it must act immediately

Since the first United Nations Conference on the Environment in Stockholm in 1972, we have come to realize that the traditional patterns of development have contributed to poverty - denying more than a quarter of the world's population adequate living conditions — to the inequitable distribution of resources to over-consumption, to the violation of human rights, and to the potentially irreversible degradation of the ecosystem.

WE DECLARE THE FOLLOWING PRINCIPLES TO GUIDE HUMANITY TO AN EQUITABLE AND ECOLOGICALLY SOUND FUTURE:

1. The ecosystem of which we are a part shall be protected and preserved, ecologically unsound patterns of development shall be condemned and the inequity of development must be addressed and rectified
2. Development activities that benefit the few while compromising the biological inheritance and quality of life of the many must be condemned as being inherently wrong
3. Most of the third world debt was accumulated as a result of development that was inequitable and detrimental to the ecosystem, and remedial and restorative measures have to be undertaken to address the inequity and ecological harm. The third world debt should be forgiven and redirected for the purpose of addressing inequity and of restoring the ecosystem. While all are responsible for improving environmental quality, those who disproportionately consume the majority of the Earth's resources and pollute the natural environment must bear the bulk of the cost of ecological restoration and protection. While this requires transferring financial and technological ecologically sound technology, it also calls for more equitable distribution of resources within all states throughout the world. "All economically developed countries should set a minimum target of 1% of their GNP for environmentally-based development aid to the developing countries, and the United Nations should establish an International Equity Fund (IEF) dedicated to a global anti-poverty mission. This fund Would cover a 10 year period, whereby all nations would contribute 2.5 % of their military budgets per year; the fund would be dedicated to provide adequate food, water, education, health and housing plus debt relief to the poorest countries of the world." (Resolutions for UNCED, Whistler Foundation).
4. International ecological standards should be in place so that no short term individual pursuit of self-interest, or short sighted national or international regulations (GATT) could jeopardize the environment. The purpose of these standards are to address the individual and multinational pursuit of self-interest and consumptive and exploitative use of the environment and not to penalize local communities that wish to function in an interdependent way within the ecosystem. The economic development necessary to eliminate poverty shall not be a mandate to abuse the environment for either short-term

gain or economic growth alone. Principle must drive industry not industry driving principle.

5. Environmental processes do not recognize national boundaries; therefore states shall not have the sovereign right to exploit resources within their territories in isolation from the global ecological needs of the Earth

6. The continued build-up of the military complex must cease, and the use of military force as a means of resolving conflict must be rejected. A radical reduction of the military budgets of the world must occur and the funds released for ecological and humanitarian purposes. Peace is not merely the absence of war but the pursuit of environmental, social justice, economic, spiritual and cultural well-being.

7. The precautionary principle shall be extended to require those who wish to intervene in the ecological commons to have to justify their intervention and demonstrate the safety of their intervention. The full environmental costs shall be considered in any proposed development project.

8. the decision making process should be clearly defined, transparent, accessible and equitable. Criteria in decision making should be revealed, and the public and affected communities should be involved at the time of the formulation of the terms of reference and through the process.

9. The international community must condemn and disallow the exporting of products deemed to be unsafe in a state where there are advance testing procedures to other states with less advanced testing procedures

10 behaviour and attitudes rather than countries should be categorized as developed, developing or underdeveloped

11. The contribution of those peoples who have been "truly developed" in that they have succeeded in living in interdependence within the ecosystem shall be recognized and their advice sought.

## EARTH CHARTER

to enshrine the following individual ecological rights

- the right to a safe ecosystem
- the right to expect that the government will foster and encourage the moral and ethical responsibilities concomitant with the protection of the right to a safe ecosystem and to an ecological heritage
- the right to require the disallowing of acts that could contribute to ecological irreversibility
- the right to demand that the government take immediate actions to address the urgent potentially irreversible environmental situation even though the action may interfere with the pursuit of short term economic privileges
- the right to prevent the government or industry from satisfying short term economic wishes that would compromise the satisfaction of long term ecological needs of future generations

- the right to expect the government not to abandon high national environmental standards to comply with international economic agreements
  - the right to have the government give the environment, primacy in decision making
  - the right to require governments to approach the ecosystem as the interdependence of principles that need to be in place if there is to be a solution ( unacceptability of "short term" solutions based on fragmentation of the problem)
  - the right to demand the preservation of significant ecosystems and that significant is not dependent on the notion of "collectibles" i.e. that if there is already an ecosystem preserved in one district would prevent a similar ecosystem from being protected in another district. the right to demand the reduction and elimination of destruction of the habitat by ecologically unsound economic practices
  - the right to demand that restrictions be placed on aesthetic or medicinal uses of fauna that could lead to species impoverishment
  - the right to demand the government to suspend any activity by Multinational Corporations that could cause environmental degradation through ecologically unsound practices.
  - the right to demand national control over the safety of products and over national standards related to ecologically sound practices in accordance with proposed international standards.
  - the right to demand that if a product or an activity is engaged in as a result of the falsification of data, or inadequate non-arm's length research that that product should be immediately taken off the market and the activity should be suspended
  - the right to demand the government to condemn and disallow the exporting of products or services that are deemed to be unsafe in a country where there may be high restrictions or regulations to other countries with more relaxed regulations ( because of their inability to test these products and because of their economic need prevents them from paying for more expensive and safer substitutes)
  - the right to demand that "caution should be exercised when there is doubt about the impact of development
  - the right to demand that ecologically sound principles drive industry not industry driving principles
  - the right to have the onus of proof shifted from those opposing the intervention "having to demonstrate that the intervention will cause harm" to those advocating the intervention "having to demonstrate that their intervention will not cause harm.
- 
- the right to ensure that remuneration should only be paid for work that is ethical ( i.e. that it does not contribute to ecological irreversibility or ecological privation)
  - the right to demand the government to assess the full environmental impact of any intervention that may cause environmental harm to the ecosystem
  - the right to demand the government to resist the temptation of accepting non-ecologically sound projects because funds from these projects could be allocated for humanitarian projects ( including job creation)

- the right of public to full disclosure about ecological consequences of an intervention
- the right of the public to have input into the decision making process at the time of meaningful alternatives: a) at the time of formulation of the terms of reference and at the time when a decision is made about an environmental assessment review is to be made; b) continually throughout the proposed project; c) at any time where there is significant public concern about the environmental impact of the project
- the right to require the government to disallow the rationalizing away of potentially harmful impact on the ecosystem through the guise of altruism or necessity
- the right to require the government to disallow projects where accidents, though unlikely, could be so disastrous that irreversible harm would occur to the environment.
- the right to require the government to prohibit the production of weapons of mass destruction and work towards the control over other weapons and towards eventual disarmament.
- the right to demand the government to reduce and eliminate use of harmful pesticides
- the right to require the government to disallow acts contributing to ecological irreversibility in all lands including those of private ownership and those whose ownership is under dispute

## EARTH CHARTER

#### EXHIBIT

1992 Canada makes vacuous promises  
Promises, which was published in the Times Colonist **as**

#### 1992 CANADA IGNORES INTERNATIONAL ENVIRONMENTAL DOCUMENTS

Canada violates or ignores international environmental documents to which it has been a signatory while deluding the world community into thinking that it is genuinely concerned about the environment.

At the press conference given by Federal Minister of the Environment, Jean Charest at the UNCED conference in Rio, a representative of the United Nations introduced Charest as being from a country which was truly concerned about the environment. During the question period I indicated that "UNCED should be a time to dispel myths not perpetuate them and that Canada is not an ecologically sound country and that we should be honest with the rest of the world

Evidence that could dispel the myth that Canada is truly concerned about the environment has been occurring for years throughout B.C. in the forest industry, and is occurring currently in the dispute in Clayoquot Sound.

Rather than the courts in Canada insisting on adherence to international environmental documents such as the World Charter of Nature (UN Resolution 37/7, 1982) or to the current Convention on Biological Diversity (1992), Canadian courts condemn those who strive to call for the adherence to international law (environmentalists), and condone those who ignore International Law. (industry).

For Example, Canada adopted the World Charter of Nature, 1982 (UN resolution 37/7) which states the following:

11. Activities which might have an impact on nature shall be controlled, and the best available technologies that minimize significant risks to nature or other adverse effects shall be used; in particular;

a) all activities which are likely to cause irreversible damage to nature shall be avoided;

c) Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed;

Have governments in Canada since 1982 "avoided" industrial activities such as ecologically unsound "logging practices that have caused irreversible damage to nature.? Have governments in Canada called upon forest companies to not proceed with ecologically unsound practices whose adverse effects are not fully understood?

In 1992, Canada is now a signatory of the Convention on Biological Diversity which notes the following:

that it is vital to anticipate, prevent and attack the causes of significant reduction or loss of biological diversity at source.

also where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat

Is Canada reducing the loss of biological diversity at the source, when it is prepared to log old growth forests before it has carried out adequate non-arm's length research into the true biodiversity of the old growth forests? Is there not strong enough evidence in place that clear-cut logging has destroyed biodiversity, yet we appear to wait for "scientific certainty" before we are prepared to avoid or minimize such a threat? By that time there may be very little biodiversity left.

At the Press Conference where Mulroney signed the Convention on Biological Diversity in Rio de Janeiro, I asked him " if the signing of this document would mean that the government of Canada would condemn ecologically unsound practices such as clear-cut logging that destroy biodiversity." He replied that "he did not want to deal with issues "

If Mulroney is willing to sign a document professing to adhere to the preservation of biodiversity, and if he is not willing to deal with the practices that contribute to the loss of biodiversity, then the Canadian public will have to bring this discrepancy between rhetoric and action to the attention of the international community..

The environmentalists who have continually been striving to preserve the little remaining old growth forests, and to call for the need to identify and do research into biodiversity are the ones who have been adhering to the principles enunciated in the United Nations' World Charter of Nature. They will also be the ones who are calling for the preservation of the old growth areas so that Canada will be able to adhere to the binding principles enunciated in the United Nations Convention on Biological Diversity. Yet it is those who act to prevent "irreversibility" that are prosecuted as criminals, and those who cause "irreversibility" that are protected by Canadian courts

( ) **THAT** in July 1992, I gave a presentation on UNCED to the National Annual General Meeting of the United Nations Association of Canada

( ) **THAT** in 1992 I attended the NARST Conference in Boston, and I went to the evening plenary of the NARST conference,

#### COMMENT

a professor Rice?? who in full patriarchal style with a beautiful assistant not unlike a tradition stage show was discussing the simplicity of science and models. I stood up and challenged him and said that he was offering nothing new but only reiterating what Herbert Simon from his University had advocated years ago. There was silence in the room of 5 hundred. I went to the washroom, and several women came up to me and thanked me for raising the issues that I raised. I also talked to one of the principal organizers who said that he had felt the same way about the key note address but of course he could not say anything.

( ) **THAT** in September, 1992, David White sent a letter to Joe Clark about the need to include "ecological rights", and the rights of future generations in the proposed Accord

#### EXHIBIT

1992 Sept  
Open letter:  
Honourable Joe Clark

Before the deadline for submissions of recommendations for the constitution, we submitted a proposal for a Charter of Ecological Rights. At the same time, we indicated that ecological rights could also be covered by extending the notion of "right to security" to "right to common security," which would include "protection of the environment," as well as the right to a safe environment.

In your response to our submission, you indicated that you had reflected upon our suggestions.

On Monday August 24, 1992, I read the article in the Globe and Mail entitled "Main provisions of unity accord." In this article, which may or may not have been based on government briefing, under the section on "Social and Economic Union," the following statement was made: "The Constitution would guarantee rights to health care, social services, education, workers' rights and protection of the environment."

Most of those concerned about the environment believed that the government had undertaken to comply with commitments made at UNCED to seriously protect the environment. On August 26, I obtained a copy of the proposed Social Charter which indicated that it would be the economy not the environment that would be sustained.

With this wording, the public has been misled by the statement in the Globe and Mail Article.

Either the government has changed this clause to enshrine the right to a sustainable, i.e., safe and sound environment, and this version has been

revised; the government has erred in its judgment of the concept of "sustainability" or the government has intentionally misled the public into thinking that the environment has been protected.

Before the government takes the constitution to the public, those concerned about the environment must be ensured that there will be serious provisions in the Constitution to protect the environment, and to guarantee ecological heritage in that present actions will not jeopardize the rights of future generations to their ecological heritage.

AGENDA 21 CHAPTER 36: EDUCATION, PUBLIC AWARENESS  
TRAINING

RESOLUTION: INFLUENCE AWARENESS OF HUMAN RIGHTS,  
ENVIRONMENT, AND PEACE ISSUES THROUGH EDUCATION

[ADD human rights and Noting that in chapter 36 of Agenda 21, a very important distinction is made between promoting "education," promoting "public awareness," and promoting "training." It appears to be clear in Agenda 21 that non-governmental organizations, community-based groups, women's groups and aboriginal groups are called upon to assist educational authorities in reorienting education. The role of industry is ascertained to be limited to specific areas of business and industrial and training programs.

Educational authorities, with appropriate assistance of non-governmental organizations, including women's and indigenous peoples' organizations should promote all kinds of adult education programmes for continuing education in environment and development, basing activities around elementary/secondary schools and local problems. The authorities and

industry should encourage business, industrial and agricultural schools to include such topics in their curricula. The corporate sector could include sustainable development in their education and training programmes. Agenda 21, Chapter 36.5 I

In the section of Agenda 21 that addresses the "promoting of public awareness" industry is included not as the dispenser of "education" but as the recipient of needed education.

"Countries and regional organizations should be encouraged, as appropriate, to provide public environmental and development information services for raising the awareness of all groups, the private sector and particularly decision makers. (Agenda 21, section 36.10 c)

In the section of Agenda 21, that addresses the "promoting of training, an important role for industry is envisioned.

To strengthen national capacities,... in training, to enable governments, employers and workers to meet their environmental and development objectives and to facilitate the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know-how (Agenda 21, 36.13 c)

Aware that educational material based on a conceptual framework of international principles has been developed.

We call upon member states of the United Nations:

-To reject industry's participation in the determination of philosophical underpinnings of education

-To support educational programs that develop materials that reflect the principles agreed to in international instruments

Noting that in chapter 36 of Agenda 21, a very important distinction is made between promoting "education," promoting "public awareness," and promoting "training." It appears to be clear in Agenda 21 that non-governmental organizations, community-based groups, women's groups and aboriginal groups are called upon to assist educational authorities in reorienting education. - To reject industry's participation in the determination of philosophical underpinnings of education

- To support educational programs that develop materials that reflect the principles agreed to in international instruments

Noting that in chapter 36 of Agenda 21, a very important distinction is made between promoting "education," promoting "public awareness," and promoting "training." It appears to be clear in Agenda 21 that non-governmental organizations, community-based groups, women's groups and aboriginal groups are called upon to assist educational authorities in reorienting education. The role of industry is ascertained to be limited to specific areas of business and industrial and training programs.

"Educational authorities, with appropriate assistance of non-governmental organizations, including women's and indigenous peoples' organizations should promote all kinds of adult education programmes for continuing education in environment and development, basing activities around elementary/secondary schools and local problems. The authorities and industry should encourage business, industrial and agricultural schools to include such topics in their curricula. The corporate sector could include sustainable development in their education and training programmes." Agenda 21, Chapter 36.5 I

In the section of Agenda 21 that addresses the "promoting of public awareness" industry is included not as the dispenser of "education" but as the recipient of needed education.

"Countries and regional organizations should be encouraged, as appropriate, to provide public environmental and development information services for raising the awareness of all groups, the private sector and particularly decision makers." (Agenda 21, section 36.10 c)

In the section of Agenda 21, that addresses the "promoting of training, an important role for industry is envisioned.

"To strengthen national capacities,... in training, to enable governments, employers and workers to meet their environmental and development objectives and to facilitate the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know-how" (Agenda 21, 36.13 c)

Aware that educational material based on a conceptual framework of international principles has been developed.

We call upon Canada

- To reject industry's participation in the determination of philosophical underpinnings of education

- To support educational programs that develop materials that reflect the principles agreed to in international instruments

Unfortunately Canada has initiated a decision making process related to environmental education or education for sustainability where industry has been influential in determining the philosophical underpinnings of education. The involvement of industry in this manner was not intended in Chapter 36.

At ECO-ed, in October 1992, the group EECOM was formed; the government of Canada also supported EECOM of "environmental educators" which included several front groups from industry such as Canadian forestry association,

I attended a work group, and when I introduced myself, I indicated my concern about industry's intrusion into education. Then the others introduced themselves and most of them were associated with industry- forest, tarsands and petroleum,

The involvement of industry in this manner was not intended in Chapter 36.  
INTRO.

NATIONAL PRIORITY

STATUS REPORT

**a) Reorientation of education towards sustainable development:**

Elementary and secondary school education falls under the jurisdiction of Canadian provinces. To ensure information sharing and collaboration in the environmental education field in Canada, the Canadian Council of Ministers of the Environment established an Education Communications Task Group. It also works in collaboration with the Council of Ministers of Education.

Provincial governments are active at different levels in the promotion of environmental education through their environment, natural resource and education ministries.

EXHIBIT

( ) THAT in September 1992, I analyzed the draft and submitted suggestions to the proposed the CORE Land use Charter

EXHIBIT

SEPTEMBER 28, 1992

ANALYSIS OF THE PROPOSED DRAFT OF THE LAND USE CHARTER

LEGEND OF TYPE

PLAIN TYPE IS FOR THE ORIGINAL CHARTER

*ITALICS ARE FOR SECTIONS THAT ARE SUGGESTED FOR DELETION*

**BOLD FOR SECTIONS THAT ARE DEEMED NECESSARY TO ADD**

**[BOLD] IN BRACKETS STATEMENT OF REASONS FOR CHANGING SECTIONS**

*A Land Use Charter*

**[inappropriate name because the Charter must address land air and water.]**

**A charter of ecological preservation and ecologically safe and sound use of resources**

**•Recognizing the urgency of the current environmental situation and for the need to address the destruction of the environment, the violation of human rights, the disregard for social justice and the perpetuation of inequity.**

**•Concurring with the assessment of the current urgency as expressed in Agenda 21, we acknowledge the following:**

**“Erosion, degradation , deforestation and desertification have led to increased land degradation, and the creation of reservoirs has, in some cases, resulted in adverse effects on ecosystems. Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection.” ( Agenda 21, 18.45 )**

**• Convinced that it is time in British Columbia to redress the imbalance that has been caused by ecologically unsound use of land, air and water, by immediately ceasing resource use in areas that could be lost for preservation, in particular the little remaining examples of significant old growth, and in fulfillment of commitments made at the Earth Summit we shall be committed to the following:**

**“Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources,”  
( Agenda 21, 11.15 b., Deforestation), 1992)**

**• Convinced that humanity must be guided by a moral code of action to respect the inherent worth of nature , and in fulfillment of commitments made in the World Charter of Nature, we shall be committed to the following:**

**“...every form of life is unique, warranting respect regardless of its worth to [humans], and to accord other organisms such recognition [humans] must be guided by a moral code of action”. (a, World Charter of Nature, 1982)**

- **Concurring with the global commitment under the "Convention for the Protection of Cultural and Natural Heritage" (1972) to fulfil our international duty to identify and protect natural heritage for future generations:**

**Each State Party to this convention recognizes that the duty of ensuring the identifications, protection, conservation, presentation and transmission to future generations of the cultural and natural heritage...(Convention for the Protection of the World Cultural and Natural heritage)**

- **Concurring with the global commitment under the World Charter of Nature ( 1982) to avoid activities which are likely to cause irreversible damage to nature**

**“Activities which are likely to cause irreversible damage to nature shall be avoided; and activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponent shall demonstrate that expected benefits outweigh potential damage to nature, and where potential aversive effects are not fully understood, the activities should not proceed” ( Agenda 21, section 11b)**

- **Concurring with the enshrinement of the precautionary principle and in fulfillment of commitments made in the Rio Declaration and in Agenda 21, we shall be committed to the following:**

**" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." ( Rio Declaration, 1992).**

- Recognizing that causes of irreversible environmental damage may not be fully understood or predictable, and in fulfillment of commitments made in Agenda 21, we shall recognize the following:**

**"In the face of threats of irreversible environmental damage, lack of full scientific understanding should not be an excuse for postponing actions which are justified in their own right. The precautionary approach could provide a basis for policies relating to complex systems that are not yet fully understood and whose consequences of disturbances cannot yet be predicted (Agenda 21, 35.4)**

- **Concurring with the enshrinement of the principle of prior environmental impact assessment and in fulfillment of commitments made in Agenda 21, we shall enshrine the following principle:**

**"Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences" 7.42 b**  
**" Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment;"**  
**(17.23 b Marine)**

- **Concurring with the global condemnation of the transfer or relocation of harmful activities or substances , and in fulfillment of our commitments made in the Rio Declaration, we shall condemn the following:**

**the transfer and relocation to other states of any activities and substances that cause severe environmental degradation or are found to be harmful to human health."**  
**(Principle 14 Rio Declaration)**

- **Concurring with the need to examine the "cradle to grave," or "full life cycle" approach to industry, and in fulfillment of our commitments made in Agenda 21, we will require and undertake the complete analysis of each industry's intervention into the ecosystem**

**"should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits" (Agenda 21 20.20 e)**

## THE PROVINCIAL COMMITMENT

The government of British Columbia is committed to:

- **preserving significant representative ecosystems**, protecting and restoring the quality and integrity of the environment, and
- **ensuring *securing ecologically safe and sound employment securing a sound and prosperous economy***

This commitment is made to the people of British Columbia and to the global community. A healthy environment and **ecologically safe and sound employment *healthy economy. are essential British Columbia. to the social, cultural, material, physical and spiritual well-being of British Columbians.*** Furthermore, the Province recognizes its obligations **under various international declarations, conventions and charters, to preserve representative ecosystems, and to protect, and manage *and use its resources and environment to fulfill its responsibility to global well-being. in an ecologically safe and sound way its land, air and water resources.*** Finally the Province shall ensure that present-day decisions do not compromise **the integrity and inherent worth of preserved ecosystems** and the ability of future generations to meet their own environmental and economic needs.

- recognizing the current change in global political situation, the province will make a request to the Federal Government to transfer a substantial segment of the military budget to be used for the preservation of significant areas of land and water bodies, for allowing for the regeneration of areas that have been destroyed, for providing for the restoration of areas that have suffered environmental degradation, and for the creation of ecologically safe and sound employment through value added jobs
- recognizing that human understanding of nature is incomplete. The province will undertake to preserve significant ecosystems
- recognizing that injunctions are usually granted to prevent irreparable harm, the issuing of injunction against those who are attempting to prevent irreversible harm is untenable

## PRINCIPLES

### *Sustainable Environment*

**[the preserving of ecosystems, the engaging in ecologically safe and sound practices and the entrenching of social programs are not separated here]**

*A healthy environment is the foundation upon which a sound economy and society depend. [Ecosystems do not only have a role to support society]. The essential role that ecosystems play in supporting our society establishes an environmental imperative that must be respected in all land, resource and economic decisions. Our priority must be to maintain natural systems for present and future generations.*

**1. To redress the imbalance resulting from years of non-compliance to the spirit of international Conventions such as the Convention for the Protection and Preservation of Cultural and Natural heritage, and Charters such the World Charter of Nature ( 1972), the Province shall immediately preserve the little remaining significant unfragmented old growth areas for ecological heritage and for the maintenance of natural systems.**

The Province shall **preserve**, maintain and enhance the life-supporting capacity of air, water, land and ecosystems. The Province shall respect and **preserve** the integrity of **intact** natural systems and **will allow for regeneration** will seek to restore previously degraded environments. **The Province will concurrently transfer funds into the creation of ecologically safe and sound employment.**

**- to redress the imbalance resulting from years of addressing the errors of previously ecologically unsound practices, the province shall support and fund research not into technological fixes for rectifying the harm**

**caused by ecologically unsafe and unsound practices, but into new and viable ecologically safe and sound practices.**

**-to redress the imbalance resulting from years of non-arm's length research reflecting conflict of interest, the province shall support independent non vested interest, arm's length research.**

**- to redress the imbalance resulting from the misplaced onus of proof, the province shall shift the burden of proof from those opposing the intervention having to demonstrate harm to those proposing the intervention having to demonstrate the ecological safety and soundness of the intervention**

**2. The Province shall preserve significant areas that contain biodiversity and shall conserve biological diversity in genes, species and ecosystem and shall condemn, ban disallow any practices that contribute to loss of biodiversity. including current practices of clear cut logging. The province will not permit the redefining of the term Biodiversity to accommodate ecologically unsound practices such as clear cut logging.**

**3. The province shall attempt to anticipate and prevent adverse environmental impacts. When making land and resource decisions, the province shall exercise caution and special concern for natural values, recognizing that human understanding of nature is incomplete.**

**4. The Province shall ensure that the true environmental and social costs are accounted for prior to making a decision for a project or an activity that will affect air, water or land. in land resource use and economic to proceed The true environmental social costs will have to consider the costs required by society not only to repair the harm but also to do research into repairing the harm, and to monitor ecologically unsound practices and to enforce regulations And in assessing the true environmental costs those who have been responsible will be required to pay for past as well as present damage ( polluter pay principle as enunciated in Agenda 21)**

**3.The province shall also establish high provincial standards for ecologically safe and sound practices and products taking into consideration fundamental international principles of preservation and ecologically safe and sound employment.**

**The province shall establish a series of independent panels reflecting community concern, not vested interests to attempt to establish province wide guidelines for ecologically safe and sound practices**

**The province shall establish a list of industries or industrial practices that have not been able to satisfy the ecologically safe and sound conditions of the life cycle approach and disallow these industries to function in the province**

**The province shall subject all interventions that could have a potential adverse effect to environmental assessment review**

**The province will disallow any practice that has been deemed ecologically unsound by a panel of independent, non-vested concerned body**

5. The province shall recognize its responsibility to **preserve significant representative ecosystems**, to protect, and restore the global environment

the province shall reduce consumption to sustainable levels, **engage in alternative practices that reduce consumption** , and avoid importing or exporting *ecological stresses activities or substances that could cause harm to human health or to the environment [statement in harmony with wording in the Rio Declaration]* and to help meet the global challenge of sustainably supporting the human population

**The province shall establish ecologically safe and sound working environments for all employees. No employee shall ever be dismissed from work for demanding to have ecologically safe and sound environment**

**The province shall not be required to pay compensation for the transferring of resource use into non-use or preservation reverting to the ecological commons.**

**The province shall undertake to assist with funds transferred from the military budget to convert ecologically unsound employment to ecologically safe and sound employment.**

6. The Province shall preserve and protect the environment for its inherent value and for the use and enjoyment of humans

*Sustainable Economy*

**[ preservation of ecosystems, and then the engaging in ecologically safe and sound practices and the entrenchment of strong social programs are not separated here}**

**The province shall recognize that the preservation of significant areas is a global requirement and is conditional not on economic development but on political will. Similarly the willingness to ensure ecologically safe and sound employment in an ecologically safe and sound environment is all dependent on political will.. The establishment of the commitment to preservation and to ecologically safe and sound employment will drive the community to fulfill these requirement.**

**Given the urgency of the current global situation, the province undertakes to ensure that employment shall be ecologically safe and sound.**

**The Province shall ensure that ecologically sound practices prevail, and will fund only appropriate technology beyond simply allowing for the prevailing of currently unsound practices.**

**The province shall ensure that ecologically unsound practices will be phased out and eventually eliminated**

**the province shall recognize that it is impossible to balance two values when the fulfillment of one is the denial of the other.**

1. The Province shall promote a dynamic and competitive **ecologically safe and sound** economy that maintains options for **land air and water preservation and ecologically safe and sound use** future land and resources uses.

**The Province shall advocate international ecologically safe and sound standards so that the province in advocating the highest tenable standards will not be at a global disadvantage**

**The Province shall make a representation to GATT to insist that high international standards be established for preservation of nature, conservation of resources, and ecologically safe and sound practices so that no action in the Province taken to address the need for ecologically safe and sound employment will be overturned as being a subsidy. For example, the decision by the province to stop the export of raw logs ( as per section 135 in the Forest Act) so as to create ecologically sound employment shall not be construed as a subsidy.**

2. The Province shall encourage diversified economic development **in an ecologically safe and sound way** that increases the employment and other benefits derived from a given stock of resources.

3. The Province shall *encourage* **insist that pollution is controlled at the source and that there will be eventually zero harmful emissions into the ecosystem encourage** , and shall **insist on proposal for development that make ecologically safe and sound and efficient use of resources**  
*development that reduces waste and makes efficient use of resources*

4. *The Province shall encourage optimum use of natural systems and resources, consistent with their inherent capability to support our economic, social and environmental needs.* { **vacuous statement unclear what that would entail** }

5. The province shall ensure that renewable resources are used in an **ecologically safe and sound** manner **so** that they will be sustainable over the long term. **and the Province will not jeopardize long term ecological**

**rights to natural heritage and to ecologically safe and sound employment for short-term economic gain**

6. The Province shall ensure that the use of non-renewable resources **is phased out and that funding be placed immediately into discovering ecologically safe and sound alternatives ( Agenda 21, Energy section)** avoids **avoiding** their exhaustion and addresses the needs of future generations

7. *The Province shall stimulate environmentally sound economic activity and innovation through a system of economic instruments* [ **environmental sound economic activity should not be introduced only in this section it should be a precondition for all future activity. By having it in this section it suggests that the reference to economic activity in other sections does not mean environmentally sound**]

8. The Province shall provide a regulatory framework which promotes stability and predictability for business and investment. **The Province, through the development of standards of ecologically safe and sound practices will minimize the need to monitor as the engaging in ecologically safe and sound practices will entail a different type of monitoring; a monitoring to determine if industry is engaging in these practices rather than a monitoring to determine whether the practices are having a significant adverse impact on the environment.**

*Social Sustainability*

[ **preservation of ecosystems, and then the engaging in ecologically safe and sound practices, and the entrenchment of strong social programs are not separated here**]

Social equity requires that the concerns of individuals and communities are respected **as ecological preservation and ecologically safe and sound employment are established.** *environmental and economic needs are balanced.*

1 The Province shall aim for a fair distribution of the costs and benefits of *land use* decisions **about land, air and water. and undertake to propose measures that will bring about a more equitable distribution of resources. This could entail the giving of a guaranteed annual income to anyone who is displaced as a result of conversion to ecologically sound employment, and ensure that the person will be appropriately retrained. In this way those whose jobs have been converted will not be required to move from the community.**

2. The Province is committed to social stability, and will support economic and social measures to address the economic effects of land use decisions **These measures could entail the giving of a guaranteed annual income to anyone who is displaced as a result of conversion to ecologically sound employment, and ensure that the person will be appropriately retrained. In this way those whose jobs have been converted will not be required to move from the community.**

3. The Province shall promote a good quality of life by fostering opportunities to;

\* earn a living **in an ecologically safe and sound way**

\* obtain education and training **by putting additional funding into the creation of post-secondary institutions**

\* access social, cultural and recreation services and

\* enjoy a quality environment **through the preservation of significant ecosystem, the creation of ecologically safe and sound employment, and the entrenching of social equity programs**

4. In addition, equity requires that land use and related resources and environmental decisions be made in a fair and open manner **without the participation of those who have a vested economic interest in not adhering to ecologically safe and sound practices**

### **REXAMINATION OF THE TERMS OF REFERENCE OF CORE AND THE "LAND USE CHARTER" IN THE LIGHT OF THE TWO FOLLOWING EXTENUATING CIRCUMSTANCES;**

#### **1. THE REQUESTED INVESTIGATION BY THE OMBUDSMAN'S OFFICE INTO THE ENVIRONMENTAL DEGRADATION CAUSED BY THE MINISTRY OF FOREST'S NON COMPLIANCE WITH THE FOREST ACT SECTION 60. OF INTERNATIONAL AGREEMENTS.**

In September 1991, we submitted a complaint to the Ombudsman office, while Steven Owen was still the ombudsman, calling for the investigation into forest practices that were causing damage to the natural environment. To support the claim we submitted a document from the Ministry of Fisheries indicating the destruction of fish habitat ( a violation of section 33 of the Fisheries Act, caused by current logging practices). We were notified that the complaint would be addressed.

While Steven Owen was the ombudsman little was done to investigate this complaint.

In January 1992, CORE was established, and Stephen Owen was named as the Commissioner. In June forestry Minister Miller, suddenly became cognizant of the degradation that had occurred through logging practices. One of the implications of this complaint is that if the complaint is deemed justified, and if the Ministry of Forests, and industry through noncompliance with the Forest Act caused damage to the natural environment, the whole discussion of "compensation" for areas that will be taken out of TFL and put into wilderness areas will be reassessed.

#### **2. THE COMMITMENTS BY CANADA TO PRINCIPLES ENUNCIATED IN INTERNATIONAL AGREEMENTS.**

practices. and calling for the enforcing of section 60 of the Forest Act was initiated prior to the completion by the Ombudsman office

CORE was initiated at a time prior to the deliberations of UNCED. As a result of many of the deliberations of UNCED, a few key principles emerged that need to reassess the terms of reference of CORE

Given the recognition of the urgency of the global situation  
" Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources, involving in situ and ex situ measures and undertaking supportive measures to ensure sustainable utilization of biological resources and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities; "(11.15 b., Deforestation)

"Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems. "  
(18.45 Fresh water)

"There are few regions of the world that are still exempt from the problems of loss of potential sources of freshwater supply, degraded water quality and pollution of surface and groundwater sources. Major problems affecting the water quality of rivers and lakes arise, in variable order of importance according to different situations, from inadequately treated domestic sewage, inadequate controls on the discharges of industrial waste waters, loss and destruction of catchment areas, ill-considered siting of agricultural practices. This gives rise to the leaching of nutrients and pesticides. Aquatic ecosystems are disturbed and living freshwater resources are threatened. ...Erosion, degradation, deforestation and desertification have led to increased land degradation, and the creation of reservoirs has, in some cases, resulted in adverse effects on ecosystems. Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems. A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies." (18.45 Fresh water)

" to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity" ( 4.7.a Changing Consumption Patterns)

Decision making process

a distinction must be made between vested interests and public concern.

# U.N. PROCLAMATION FOR TRANSLATING RHETORIC INTO ACTION

## IN 1972, WE SAID, recognizing our ignorance

Declaration of the United Nations Conference on Humans and the Environment (1972)

- A point has been reached in history when we must shape our actions throughout the world with a more prudent care for their environmental consequences. Through ignorance or indifference we can do massive and irreversible harm to the earthly environment...
- Man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well being, and he bears a solemn responsibility to protect and improve the environment for present and future generations (Principle 1)
- Man and his environment must be spared the effects of nuclear weapons and all other means of mass destruction. States must strive to reach prompt agreement, in the relevant international organs, on the elimination and complete destruction of such weapons (Principle 26)

## IN 1982, WE WERE STILL SAYING,

World Charter of Nature (1982)

- Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature, and where potential adverse effects are not fully understood, the activities should not proceed (11 b)
- Activities which are likely to cause irreversible damage to nature shall be avoided (11. a)
- All areas of the earth, both land and sea, shall be subject to these principles of conservation; special protection shall be given to unique areas, to representative samples of all the different type of ecosystems and to the habitats of rare or endangered species (3)
- Every form of life is unique, warranting respect regardless of its worth to man, and to accord other organisms such recognition, man must be guided by a moral code of activities (16)
- Knowledge of nature shall be broadly disseminated to the public, and shall be supported by ecological education as an integral part of general education. (16)
- Military activities damaging to nature shall be prohibited (16)

## NOW IN 1992, WE ARE SAYING, acknowledging the knowledge

Humanity stands at a critical moment in its history. Within and without nations, a worsening environment, which undermines sustainable development, we depend for our very survival on which

### Rio Declaration on Environment and Development

- States should co-operate to develop and implement effective global and national arrangements to prevent, reduce and control transboundary and global environmental degradation or damage caused by hazardous activities within their jurisdiction or controlled by them (Principle 2)
- In order to protect and restore the global environment, States should co-operate to develop and implement effective global and national arrangements to prevent, reduce and control transboundary and global environmental degradation or damage caused by hazardous activities within their jurisdiction or controlled by them (Principle 2)

### Agenda 21

- The growth of the world population, the increasing demand for food, and the depletion of natural resources, particularly the life-supporting capacities of oceans, are major concerns of the world community (Agenda 21, 17.23b)
- Forests worldwide have been and are being degraded and destroyed, and the loss of biological diversity, particularly the loss of species, is a major environmental concern (Agenda 21, 17.23b)
- Despite mounting concern over the past few years, the loss of the world's biological diversity, particularly from habitat destruction, over-exploitation, pollution and the inappropriate introduction of alien species, continues to be a global environmental concern (Agenda 21, 17.23b)
- Many of the problems have a global dimension and require a global response and international co-operation (Agenda 21, 18.45)
- Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally hazardous wastes at unprecedented rates (Agenda 21, 19.45)
- Environmentally sound waste management practices and the more widespread use of recycling are essential to address the root cause of the problem by attempting to change and improve patterns of production and consumption (Agenda 21, 19.45)
- Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment (Agenda 21, 17.23b)
- Apply preventive, precautionary and anticipatory approaches to activities which threaten the marine environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it (Agenda 21, 17.23b)
- ...Taking into account the cradle-to-grave approach to the management of hazardous wastes (Agenda 21, 19.45)
- to promote a 'culture of safety' in all countries... (Agenda 21, 17.23b)
- Develop application of responsible care approach... (Agenda 21, 20.36)
- ...taking into account entire life cycle (Agenda 21, 19.45)
- ...equitable implementation of the polluter pays principle (Agenda 21, 20.39 b)
- Effective prevention requires action through effective monitoring and the enforcement and imposition of appropriate penalties (Agenda 21, 20.20)
- To increase the availability... in developing countries for utilizing and producing environmentally [safe and] sound renewable energy resources, such as solar, wind geothermal, hydropower and biomass. (Agenda 21, 9.9)
- Indigenous people and their communities shall enjoy the full measure of human rights and fundamental freedoms without hindrance or discrimination (Agenda 21, 26.1)

## Now in 2002 we must be resolved to act

- Be it resolved that the global community cease all activities that could have significant adverse environmental effects (specifically activities such as the testing of nuclear weapons, the use of nuclear armed or powered vessels, the engaging in ecologically unsound practices, and the production of ecologically unsound products), that deny social justice, that violate human rights, and that contribute to war and conflict.
- Be it further resolved that a significant proportion of the global military budget be transferred to preserve ecological heritage, to create ecologically safe and sound employment, and to foster global social justice

**IN 1972, WE SAID**, recognizing our ignorance  
in the Declaration of the United Nations Conference on the Human  
Environment (1972)

- A point has been reached in history when we must shape our actions throughout the world with a more prudent care for their environmental consequences. Through ignorance or indifference we can do massive and irreversible harm to the earthly environment...
- “Man [human] has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well-being, and he bears a solemn responsibility to protect and improve the environment for present and future generations” (Principle 1)
- “Man [human] and his environment must be spared the effects of nuclear weapons and all other means of mass destruction. States must strive to reach prompt agreement, in the relevant international organs, on the elimination and complete destruction of such weapons” ( Principle 26)

- Knowledge of nature shall be broadly disseminated by all possible means, particularly by ecological education as an integral part of general education. (16)
- Military activities damaging to nature shall be avoided (Principle 20)

**NOW IN 1992, WE ARE SAYING AGAIN**, with knowledge

Humanity stands at a defining moment in history. We are confronted with a perpetuation of disparities between and within nations, a worsening of poverty, hunger, ill health and illiteracy, and the continuing deterioration of the ecosystems on which we depend for our well- being ( Agenda 21, Preamble, 1.1)

**Prepared the policy statement “United Nations Proclamation for Translating Rhetoric and Action— a proclamation delineating significant obligations incurred and expectations created through international agreements—and presented the proclamation at the plenary session from a working group on**

**“international issues” at the ECO-ED conference, and circulated this proclamation widely for signatures at the conference and at subsequent international conferences.**

**and on " Canada's International Environmental Rhetoric" (1992)**

**( ) ECO-ED**

**EXHIBIT** In October 1992, only four months after UNCED, the World Congress on Education and Communication on Environment and Development (ECO-ED), took place in Toronto. One of its key objectives was to increase the potential of environmental education to meet the challenge of UNCED by forming new partnerships and exchanging information and perspectives. ECO-ED brought together more than 260 key presenters and 4500 participants from eighty-four countries.

In 1992, thirteen national education associations agreed to form a Coalition of Education Leaders to promote environmental citizenship in their respective communities.

**( ) ECO-ED**

- revelation of a series of divergent principles that continue to prevent the convergence between concern/principle and action ( See Russow, J. and White, D. (1991) "Systemic Constraints Preventing Change: See Russow, J. "Miseducation through Rhetoric: Implications for Global Education ( Divergent principles) ," paper presented at ECO-ED, 1992, and White, D. "Mis-education through Rhetoric: Implications for Global Education (Forestry policy)"

**COMMENT**

**The ERA Ecological Rights Association, as part of its presentation at ECO-Ed, "Mis-education through Rhetoric: implications for Global Education," prepared and circulated a proclamation entitled "The United Nations Proclamation for Translating Rhetoric into Action. This proclamation was signed by over 250 delegates to ECO-Ed from over 40 countries, and is currently being circulated around the world. The ERA Ecological Rights Association has also extracted principles from UNCED and prepared for circulation a "Principle-adherence Report" to evaluate the compliance or non-compliance of states to some of the principles that emerged from the UNCED documents.**

- revelation of a series of divergent principles that continue to prevent the convergence between concern/principle and action ( See Russow, J. and White, D. - 1992. Wrote a paper on "Mis-education through Rhetoric:

Implications for global education" and presented the paper at the United Nations Conference on Environmental Education (ECO-Ed), Toronto. This paper outlined the discrepancy between international Rhetoric and National inaction

*I met Wendy Goldstein from the IUCN who attended my session.*

-Alicia Barcena, from the Earth Council spoke about UNCED. I pointed out that there were at least 200 principles that could be derived from UNCED, and a programme could be prepared on a principle-based approach

- spent time getting signatures for the UN proclamation for translating rhetoric into action. Ironically this proclamation because of the design gave the illusion of being an official document and was, when in placed it up along with official documents, it was not taken down. --An indication that often people do not read.

- Session on education with key note speaker MacLaren. We could sense that the group that was emerging was supportive of increased corporate involvement in education. We broke up into discussion groups and did a round. I was first and expressed my concern about what I saw as a development coming out of Rio was the increased intrusion of corporations into education. After the round I found out that most of the delegates in my group were from industry including industry front groups; Also a representative from the Royal Society Magnus **Lundgren** -teaching at Uvic. I said that I was certain that Digby Maclaren the former president of the Royal Society would not concur with his support of corporate involvement in Education David and I put our names in for BC representatives. Rick Kool, and from Ann Eco?? appeared to fully support corporate intrusion

IDRC KEITH BESANYON SPOKE ABOUT ALL THE WORK THAT NEEDED TO BE DONE

I SAID PUBLICLY THAT THERE WERE ALREADY AT LEAST 200 PRINCIPLES THAT COULD BE IMPLEMENTED IMMEDIATELY

BATA SHOES AND ALOS AND INDONESIAN SHOE FACTORY. EAST TIMOR

MOVE: ALOS AND EAST TIMOR MADE A TAPE AND THIS WAS CIRCULATED WITH MANUFACRUTING CONSENT BY NAOM CHOMSKY

BATA women also on panel

World Bank representative for the Environment

There was a session on the World Bank and the contribution the first speaker on the panel was from Indonesia or the Philippines, and she spoke glowingly of how the World Bank had helped her country. The representative from the World Bank exclaimed his on-going dedication to the environment. During the question period, a Toronto woman originally from Thailand stood up and denounced the World Bank She said my mother used to be able to drink the water from the creek now with your help she has to buy bottled water, and now thanks to the World Bank there are prostitutes serving the Western world.

After she spoke , Also spoke condemning Bata and what they were doing in ??? in supporting Indonesian suppression and atrocities in East Timor

While I was waiting, I spoke French to a woman from Senegal ... She asked if I would interpret for her

A real problem at Eco-Ed was lack of translation into even French and Spanish

I agreed and after I made my comment opposing the World Bank. I interpreted for her. Because I had talked with her earlier I had a good idea about what she was going to say. It was incredibly difficult to stand in front of about 700 people and interpret for a half an hour, and then the next person also from Africa asked me to interpret for him which I did for another half hour. Both of them condemned the World Bank.

The woman sitting behind me was from the World Bank when I returned to my seat, the woman behind me {from the World Bank} said that the World Bank rep was poorly treated. I said that I would like to know more about the World Bank she offered to put me on the mailing list and I received their publications for the next few years.

Gave a presentation on a panel at ECO-ED "Misinformation Through Divergent Principles ECO-ed

## EXHIBIT

1992

Mis-education through Rhetoric: Implications for Global Education, October, 1992, by Joan Russow, Sessional Lecturer, Global Issues Environmental Studies, Program University of Victoria)

Divergent principle of shelved commitments

This principle involves the making of strong recommendations but failing to summon up the political will to carry out the recommendations.

IN 1972, WE SAID, recognizing our ignorance  
Declaration of the United Nations Conference on the Human Environment (1972)

- "A point has been reached in history when we must shape our actions throughout the world with a more prudent care for their environmental consequences. Through ignorance or indifference we can do massive and irreversible harm to the earthly environment...
- Man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well-being, and he bears a solemn responsibility to protect and improve the environment for present and future generations (Principle 1)
- Man and his environment must be spared the effects of nuclear weapons and all other means of mass destruction. States must strive to reach prompt agreement, in the relevant international organs, on the elimination and complete destruction of such weapons" (Principle 26)

IN 1982, WE WERE STILL SAYING,  
World Charter of Nature ( 1982)

- “Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature, and where potential adverse effects are not fully understood, the activities should not proceed (11 b)
- Activities which are likely to cause irreversible damage to nature shall be avoided (11. a)
- All areas of the earth, both land and sea, shall be subject to these principles of conservation; special protection shall be given to unique areas, to representative samples of all the different type of ecosystems and to the habitats of rare or endangered species (3)
- Every form of life is unique, warranting respect regardless of its worth to man, and to accord other organisms such recognition, man must be guided by a moral code of action (a)
- Knowledge of nature shall be broadly disseminated by all possible means, particularly by ecological education as an integral part of general education. (16)
- Military activities damaging to nature shall be avoided” (Principle 20)

NOW IN 1992, WE ARE SAYING AGAIN, with knowledge

“Humanity stands at a defining moment in history. We are confronted with a perpetuation of disparities between and within nations, a worsening of poverty, hunger, ill health and illiteracy, and the continuing deterioration of the ecosystems on which we depend for our well- being” ( Agenda 21, Preamble, 1.1)

Rio Declaration (1992)

- “States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health” (Principle 14)
- “In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.” ( Principle 15)

Agenda 21

- “The growth of world population and production combined with unsustainable consumption patterns places increasingly severe stress on the life-supporting capacities of our planet” ( Agenda 21, 5.2)
- Forests worldwide have been and are being threatened by uncontrolled degradation and conversion to other types of land uses... and environmentally harmful mismanagement including...unsustainable commercial logging...and the impacts of loss and degradation of forests are in the form of soil erosion;

loss of biological diversity, damage to wildlife habitats and degradation of watershed areas..”(Agenda 21, 11.12)

- “Despite mounting efforts over the past 20 years,, the loss of the world's biological diversity, mainly from habitat destruction, overharvesting, pollution and the inappropriate introduction of foreign plants and animals has continued” ( Agenda 21, 15.3)
- Many of the problems have arisen from a development model that is environmentally destructive and from a lack of protection. ( Agenda 21. 18.45)
- Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally persistent wastes at unprecedented rates (Agenda 21, 21.7)
- Environmentally sound waste management must go beyond the mere safe disposal or recovery of wastes that are generated and seek to address the root cause of the problem by attempting to change unsustainable patterns of production and consumption. ( Agenda 21, 21.4)
- Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment (Agenda 21, 17.23b)
- Apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it ( Agenda 21, 17.23 )
- ...Taking into account the cradle-to-grave approach to the management (Agenda 21, 20.20)
- to promote a 'culture of safety" in all countries... (Agenda 21, 7.60)
- Develop application of responsible care approach... (Agenda 21, 20.18)
- ...taking into account entire life cycle ( Agenda 21, 19.45)
- ...equitable implementation of the polluter pays principle (Agenda 21, 20.39 b)
- Effective prevention requires action through effective monitoring and the enforcement and imposition of appropriate penalties (Agenda 21, 20.20)
- To increase the availability .. in developing countries for utilizing and producing environmentally [safe and] sound renewable energy resources, such as solar, wind geothermal, hydropower and biomass. (Agenda 21, 9.9)
- Indigenous people and their communities shall enjoy the full measure of human rights and fundamental freedoms without hindrance or discrimination (agenda 21, 26.1)

“Indigenous people and their communities have an historical relationship with their lands and are generally descendants of the original inhabitants of such lands. In the context of this chapter the term "lands" is understood to include the environment of the areas which the people concerned traditionally occupy. Indigenous people and their communities represent a significant percentage of the global population. They have developed over many generations a holistic traditional scientific knowledge of their lands, natural resources and environment. Indigenous people and their communities shall enjoy the full measure of human rights and fundamental freedoms without hindrance or discrimination. Their ability to participate fully in sustainable development practices on their lands has tended to be limited as a result of factors of an

economic, social and historical nature. In view of the interrelationship between the natural environment and its sustainable development and the cultural, social, economic and physical well-being of indigenous people, national and international efforts to implement environmentally sound and sustainable development should recognize, accommodate, promote and strengthen the role of indigenous people and their communities.” (Agenda 21, 16.1)

“In full partnership with indigenous people and their communities, Governments and, where appropriate, intergovernmental organizations should aim at fulfilling the following objectives: (Agenda 21, 16.3)

(a) Establishment of a process to empower indigenous people and their communities through measures that include:

(i) Adoption or strengthening of appropriate policies and/or legal instruments at the national level;

(ii) Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate;  
recommendations

States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health. ( Rio Declaration, Principle 14)

In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation. (Rio Declaration, Principle 15)

National authorities should endeavour to promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should, in principle, bear the cost of pollution, with due regard to the public interest and without distorting international trade and investment.”(Rio Declaration, Principle 16)

Canada violates or ignores international environmental documents to which it has been a signatory while deluding the world community into thinking that it is genuinely concerned about the environment.

At the press conference given by Federal Minister of the Environment, Jean Charest at the UNCED conference in Rio, a representative of the United Nations introduced Charest as being from a country which was truly concerned about the environment. During the question period I indicated that " UNCED should be a time to dispel myths not perpetuate them and that Canada is not an ecologically sound country and that we should be honest with the rest of the world

Evidence that could dispel the myth that Canada is truly concerned about the environment has been occurring for years throughout B.C. in the forest industry, and is occurring currently in the dispute in Clayoquot Sound.

Rather than the courts in Canada insisting on adherence to international environmental documents such as the World Charter of Nature ( UN Resolution 37/7, 1982) or to the current Convention on Biological Diversity ( 1992), Canadian courts condemn those who strive to call for the adherence to international law (environmentalists) , and condone those who ignore International Law. (industry).

For Example, Canada is a signatory of the World Charter of Nature, 1982 (UN resolution 37/7) which states the following:

11. Activities which might have an impact on nature shall be controlled, and the best available technologies that minimize significant risks to nature or other adverse effects shall be used; in particular;
  - a) all activities which are likely to cause irreversible damage to nature shall be avoided;
  - c) Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed;

Have governments in Canada since 1982 "avoided" industrial activities such as ecologically unsound "logging practices that have caused irreversible damage to nature.? Have governments in Canada called upon forest companies to not proceed with ecologically unsound practices whose adverse effects are not fully understood?

In 1992, Canada is now a signatory of the Convention on Biological Diversity which notes the following:

that it is vital to anticipate, prevent and attack the causes of significant reduction or loss of biological diversity at source.

also where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat

Is Canada reducing the loss of biological diversity at the source, when it is prepared to log old growth forests before it has carried out adequate non-arm's length research into the true biodiversity of the old growth forests? Is there not strong enough evidence in place that clear-cut logging has destroyed biodiversity, yet we appear to wait for "scientific certainty" before we are prepared to avoid or minimize such a threat? By that time there may be very little biodiversity left.

At the Press Conference where Mulroney signed the Convention on Biological Diversity in Rio de Janeiro, I asked him, "if the signing of this document would mean that the government of Canada would condemn ecologically unsound practices such as clear-cut logging that destroy biodiversity." He replied that "he did not want to deal with issues."

If Mulroney is willing to sign a document professing to adhere to the preservation of biodiversity, and if he is not willing to deal with the practices that contribute to the loss of biodiversity, then the Canadian public will have to bring this discrepancy between rhetoric and action to the attention of the international community...

The environmentalists who have continually been striving to preserve the little remaining old growth forests, and to call for the need to identify and do research into biodiversity are the ones who have been adhering to the principles enunciated in the United Nations' World Charter of Nature. They will also be the ones who are calling for the preservation of the old growth areas so that Canada will be able to adhere to the binding principles enunciated in the United Nations Convention on Biological Diversity. Yet it is those who act to prevent "irreversibility" that are prosecuted as criminals, and those who cause "irreversibility" that are protected by Canadian courts

I have analyzed statements in the following Government of Canada statutes and attempted to extract and categorize general principles underlying these statements:

The Atomic Energy Control Act, R.S. C A-19, S 1  
The Emergency Preparedness Act, 1988, C 11.  
The Canadian Environmental Protection Act, 1988, C 22.  
The Environmental Contaminants Act, 1974-75-76, C 72.  
The Fisheries Act, 1977, C 35  
The Department of the Environment Act, R.S., C 14 (2nd Supp.), s2  
The Government Organization Act 1979, C 13  
The Hazardous Products Act, R.S., C H-3, S 1

In all the statutes, which I examined, dealing with either hazardous materials or the pollution caused by hazardous materials, importance is placed on the determination of the safety of the hazardous materials. And it is recognized that in order to determine safety, it is necessary to have

information about the materials and their uses. This principle is enunciated in the following examples drawn from the statutes.

a) In section 11 (Disclosure) of the Hazardous Products Act, “disclosure of information is required where the Minister has reason to believe that a product or substance may be dangerous... The Minister may send a written notice to the manufacturer of the product or substance requesting the manufacturer to disclose to the Minister the formula, composition or chemical ingredients of the product or substance and such other information in the possession of the manufacturer as the Minister deems necessary for the purpose of determining whether the product or substance is or is likely to be a danger to the health or safety of the public.”(the Hazardous Products Act. R.S., CH-3, S 1)

b) Pursuant to 7 (2) Of the Environment Contaminants Act “where the Minister of National Health and Welfare believes that a substance will constitute a significant danger to human health or the environment, the Minister may send a written notice to any person engaged in any commercial, manufacturing or processing activity involving the substance or any member of a classes of substances of which the substance is a member requiring that person to furnish the Minister with such information specified in the notice.” (The Environmental Contaminants Act. 1974-75-76, C 72)

c) Section 33. 1 of the Fisheries Act states the following:  
“Every person who carries on or proposes to carry on any work or undertaking that results or is likely to result in  
a) the deposit of a deleterious substance in water frequented by fish or in any place under any conditions where that deleterious substance or any other deleterious substance that results from the deposit of that deleterious substance may enter any such water, or  
b) the alteration, disruption or destruction of fish habitat shall on the request of the Minister... (a) provide the Minister with such plans, specifications, studies, procedures, schedules, analyses, samples or other information relating to the work or undertaking and with such analyses, samples, evaluations, studies or other information relating to the water, place or fish habitat that is or is likely to be affected by the work or undertaking as will enable the Minister to determine  
c) whether there is or is likely to be a deposit of a deleterious substance by reason...d) whether the work or undertaking results or is likely to result in any alternation, disruption or destruction of fish habitat.”  
(Federal Fisheries, 1977, C. 35)

e) In section 5 Department of the Environment Act  
“The Minister in exercising his powers and carrying out his duties and functions under section 4 shall...

5(ii) ensure that new federal projects, programs and activities are assessed early in the planning process for potential adverse effects on the quality of the natural environment and that a further review is carried out of those projects, programs, and activities that are found to have probable significant adverse effects and the results thereof taken into account”,

f) Furthermore in Section 2 of the Environmental Contaminants Act consideration is given to effects that are persistent and cumulative:

“(iii) the extent to which the substance or any class of substances of which it is a member can become dispersed and will persist in the environment.

(iv) the ability of the substance or of any class of substances of which it is a member to become incorporated and to accumulate in biological tissues and to cause biological change.” (The Environmental Contaminants Act. 1974-76)

8. That the principle is set out in the regulations related to the Atomic Energy Board Act that extreme precautions must be taken in the transport of atomic materials:

a) “\*(2) Any person who transports or causes to be transported any radioactive material ...” (see Exhibit A for the list of stipulated regulations for atomic materials)

9. That the principle is expressed in the Emergency Preparedness Act that the government has a duty to make extensive provisions for civil emergency preparedness

Divergent Principle of accumulated appeasements

This principle involves the participating in conferences, conventions, round tables that examine a particular issue , knowing that delay dispels criticism

Divergent principle of managed conception

This principle involves the offering of a new vision by destroying of what exists so that it will no longer even be conceived

Principle of destroying what exists to eliminate its conception [to deny its prior existence]

involves the destruction of what exists so that it will not even be conceived

For example, if the old growth forests were destroyed the conception of the old growth forest would be the "managed" forest of industry.

Principle of management of conception of preservation

involves the creation usually through a diorama in museum of what one wants to bring into existence

A major problem in *settling the question* of "old growth preservation" is defining "old growth" - everyone has his or her own definition. the term "old growth" more likely describes a *biological condition* or forest environment, rather than trees of a specific age classification.

Once it is defined, the biggest problem then is that society must decide on the goal and the strategy. Preservation of land areas should be both *biologically reasonable* and *socially affordable*. Society needs to weigh the costs and benefits of all the options.

One solution could be to leave some of the new forests we are growing long enough to develop the characteristics of old growth stands. (Janna Kumi, Silviculture Research Coordinator, MacMillan Bloedel) [they have eliminated the concept of an old growth forest being an area where there has been no human intervention)

Divergent principle of fulfillment illusion

This principle involves the stating of objectives but knowing that fulfillment is impossible

Divergent Principle of non-enforceability

This principle involves the agreeing to anything providing that it will not be enforceable

Divergent principle of excluded alternative

This principle involves the claiming to consider an alternative but then irreversibly eliminating the alternative during the period of deliberation

3. Talk and log syndrome

ethical implications of violation of the "principle of fair alternative" which ensures that no action should irreversibly destroy an alternative while this alternative is purported to be seriously considered.

In the decision making process alternatives that are purported to be under consideration are being eliminated while the decision making process continues.

Although certain areas have been set aside, while the Commission on Resources and Environment is involving the community, logging will proceed in specific areas.

Divergent Principle of fair unequal access

This principle involves the asserting of equal access while affirming that some have more equal access than others  
involves access being determined in a mobility sense rather than a pecuniary sense

Everyone has access; " everyone has the right to sleep under the bridges of Paris but it is only the poor who avail themselves of that right"

Divergent Principle of Misconstrued balance

This principle involves expressing concern about the fairness, consensus and balance, and then failing to make a distinction between vested human interests and ecological concerns

Members on Round table

Divergent principle exclusionary tactics or extreme exclusion

This principle involves the lauding of the consensus process and then ensuring that the extreme views are excluded before the process begins  
For example, prior to engaging in the Consensus process for CORE, the so-called different sectors are to meet select delegates; the delegates that reflect the extremes in each group will thus be eliminated as delegates, before the delegates enter into the consensus process

**For example, during the public work shops for the Canadian "Green Plan," there were sessions with participants**

Divergent principle of predetermine failure of consensus to justify unilateral decision

This principle involves decision making body initiating a process of consensus, which by its composition will not achieve consensus, and then indicating that if the process does not work, the decision making body will make the decision.

For example , in the description of the consensus process for CORE, the premier states:

"The Commission will complete its regional planning process on Vancouver Island within 18 months. If consensus is not possible, after duly considering the Commission's public report, decisions on protected areas and the working forest will be taken by government." (Premier Harcourt, Press Release, January 18, 1992)

Divergent principle of misapplied balance or fairness:

This principle involves the extolling of fairness and balance in the remainder while having destroyed and "managed" a large proportion of the whole

involves the destruction of large proportion of whole and then demanding the sharing of the remainder, and extolling the unfairness of the opposition for not being willing to share or to enter into a "balanced" process

Divergent principle of survival rationalization

This principle involves the extolling of the value of the work ethic to justify the causing of harm

Divergent Principle of Pontification ( the greener than thou)

This principle involves the undertaking to "solve " a problem that exists externally while ignoring the same problem when it exists internally [thus giving the illusion that the problem does not exist internally ]

magnanimity

rather than address the problem locally, the state offers to address the same problem in another state thus giving the illusion that the problem does not exist in the home state

to address external problem presumes that problem does not exist internally  
Mulroney at UNCED promised 115 M for "managing forests in developing countries

Divergent Principle of commitment entailing presumption of minimum standard

This principle involves proposing a solution to a problem whose existence depends on a much deeper problem that is not even being addressed.

Brazil states it will include 'environmental education," in the school system, conveying the impression that it has in fact a school system (Lopes, personal communication)

Divergent principle of flaunting the good to disguise the bad

This principle involves the focusing on the only non-destructive part of production while ignoring the serious impacts of the predominantly destructive part of the production.

For example Alcan flaunting Alcan Recycling while destroying displacing cultures and destroying the environment through the production of aluminum

Divergent principle of industry-driving principle

This principle involves the proponent of harm determining what should constitute harm

Divergent principle of misplaced onus of proof

This principle requires opponents of activities that could have potentially significant adverse environmental effects to have to demonstrate harm rather than proponents of the activities having to demonstrate the safety of their activities.

Divergent principle of opportunistic criticism ( self servingism)

this principle involves the phrasing and using of the criticism of the opposition to discard a term or practices and then replacing it with a term or practices that would be less acceptable to the opposition

Principle of opportunistic criticism: self servingism  
involves using the criticism of the opposition to discard a term or practices  
and then replacing it with a term or practice that would be more despicable to  
the opposition

statement of the Round table

Sustainable development

replaced with "sustainability"

" One of the most important findings of the British Columbia round Table's  
initial series of public consultations was that the use of the term 'sustainable  
development' was problematic. AS in the rest of the world, British Columbians  
had difficulty accepting the Brundtland Commission's definition of this term  
and the Round Table found that the debate surrounding this definition often  
detracted from the development of a proactive strategy designed to meet  
British Columbia's needs. AS s result of the apparent contradiction between  
'sustainable ' ( meaning capable of being maintained) and "development"  
( implying expansion and growth), the round Table has chosen to adopt the  
simpler term of 'sustainability' ( meaning a process or a state that can be  
maintained indefinitely).

Divergent principle of delusion of solution

This principle involves the offering of a solution that is either equally as bad or  
worse than the problem it was intended to solve

1.4. "Principle of delusion of solution"

Making strong statements and then offering a solution that is worse than the  
problem,

IAEA document

Divergent principle of the dogma of "flamboyant absurdity"

This principle carries the concerns of one's opponents to the point where the  
regulations governing the opponents concerns should become the standard  
by which other potentially lesser concerns will be addressed.

For example, the IAEA appears to advocate that, what is considered to be  
the most dangerous industry, just because it is dangerous, has developed  
stringent standards, and that they who contribute to possibly the greatest  
uncontrollable hazard are the ones who should assist the community in  
dealing with other hazards.

The basic principles for radiation protection and safety in all  
applications and activities in nuclear science and technology are  
precautionary and are so well founded in science and so widely  
accepted that they are now also being regarded as a source of  
guidance in controlling pollutants and impacts arising from other  
human activities. Their wider application would undoubtedly  
contribute towards sustainable development. (p.2)

Divergent principle of "justification through dire consequences of alternatives"  
device

This device involves the revealing of the dire consequences of the current practices and offering one own practice as the salvation for the problem

In the following statement the IAEA cites the dire consequences of the other alternatives to justify their proposed alternative:

“The problem of acid rain, which is linked to emissions from the burning of fossil fuels, has been recognized for decades..... . the primary concern about the continued and increasing use of fossil fuels is the problem of CO<sub>2</sub> emission and the potential impact on world climate...World conference on the Changing Atmosphere... need to reduce CO<sub>2</sub> emission (IAEA document, p. 5)  
climate change in connection with fossil fuels” (p. 9)

Divergent principle of the "benevolent outcome exploitation" strategy

This strategy involves the selection of the outcome which the opposition to the proposed alternative would advocate and the subsequent attempt to demonstrate that the proposed alternative, which the opposition would condemn, would be the best way of achieving that outcome.

In the following statements from the IAEA document, the IAEA focuses on the desired outcomes of reducing acid rain and limiting greenhouse gas to justify the selection of their proposed alternative:

“Several governments have already made commitments to reduce carbon emission, while recognizing that this will be hard to achieve except through drastic policy decisions in the energy sector.” (IAEA Document, 1992, p.6)

“Nuclear power plants in normal operations cause very little environmental detriment and are beneficial when they replace plants which would emit CO<sub>2</sub>, SO<sub>2</sub>, and NO<sub>2</sub> (p. 12). In this respect they would help to reduce acid rain and limit greenhouse gas emissions” (IAEA Document 1992 , p. 12)

Divergent Principle of usurpation of opponents desired consequences

This principle involves the commiserating with the opponent's concern and then showing how the opponent's position would deny the concern

"Principle of usurpation of opponents desired consequences"

involves the selection of the opponents concern and then showing how the opponents position would deny the opponents concern

For example, The Fraser Institute of British Columbia is against rent controls. To support their opposition, they indicate how rent controls would contribute to discrimination ( something that the opponent would be concerned about)

Divergent Principle of vested interest altruism or blatant visual misrepresentation

This principle involves the portrayal or depiction of an idyllic state disguising vested interest or ecologically unsound practices, visually or verbally. For example in the development plans presented by the Forest Companies, industry depicts a fawn, a single logger in the Forests and a clear cut the size of a classroom, a blatant case of visual misrepresentation.

At the public viewings sponsored by the company and usually with a concurrent presentation by the Ministry of Forestry, there are usually presentations of plans (verbal-graphic imagery) indicating what is to be done accompanied by visual representations (visual imagery) of what they claim will occur. I have noticed that there is a disjunction between the presentation of plans and the visual representation. In the visual representation are often scenes of fawns in the forest, a logger with a saw in an area that appears to be fully treed, and a photograph of a clear-cut area that gives the impression of being not much larger than a class room. I as a member of the public have been initially intimidated by the complexity of the plans and look to the visual representation for clarification and simplification of the information. In the plans there is evidence of large areas of clear cut but in the visual representation there is usually no visual evidence of road blasting, of construction extensive road building, of miles of deforestation caused by clear-cut, of broadcast burns, or of non-productive planted areas that pass for reforestation. I felt that while I had been asked to attend the public process viewings, I do not feel that I have been presented with the real alternatives: I was left with the impression that the companies have been allowed to use whatever visual images they wish in order to inform and communicate with the public, regardless of whether the visual images correspond to what is actually being done. I also noticed that at several sessions the Ministry of Forestry and the Ministry of Fisheries were in attendance with their own visual representation. When they were present they also depicted scenes of wilderness. I felt that I had been visually misled by not only the forest companies but also by the government departments that are supposed to be monitoring the forest companies in the public interest.

2. Another example of visual/verbal misrepresentation is present in the juxtaposition of the actual forests.(visual imagery) and the interpretation of what the visual image represents( verbal imagery). On a trip through the Cowichan Valley I noticed an example of a lush second growth forest. On the road in front of this lush second growth, Fletcher Challenge has placed a sign. that reads "Fletcher Challenge, naturally seeded, 1920." This juxtaposition between the lush second growth forest and the sign is another example of verbal/visual misrepresentation. Fletcher Challenge neglected to mention on the sign that this lush second growth forest is not the outcome of their current forest practices, and that the only reason that this second growth stand, is so lush is that it was logged at a time when there was minimal construction of roads, when there was no full scale clear-cut, and when there was no prescribed burn and when it was not replanted in off-site monoculture.

### Divergent principle of silken transition

This principle involves the expression of deep concern before launching into the real agenda, so that the reader is ready for acceptance

For example

"Surveys have shown clearly the concern of Canadians for their environment: but patterns of behaviour that spring from generations of rising expectations and assumptions of inevitable economic growth are slow to change. Environmental security and job security often seem to be in conflict.

The key is education: first, to transform public concern into appropriate decision making and action; second, in the longer term, to help new generations to understand the interdependence of ecology and economic development, to acquire the skills to find the balance between them, and to develop the commitment to participate in the search for a more sustainable future.

"Learning for a sustainable Future:" A sustainable Development Education Program. affiliated with the Conference Board of Canada.

Industry Association Contact Meetings - members of the Board of Directors and Conference Board staff held a series of meetings with major industry associations to ask them to promote the program with their member companies. These member companies will be approached for the private sector portion of the program funding in 1992. Association involvement was seen as a critical part of the legitimization process for the companies.

### Divergent Principle of entailment of presumed minimum

This principle involves undertaking to address a problem that is dependent upon a more serious problem that is not addressed

### Divergent Principle of redefining legally binding terms

This principle involves the recognition that it is important that a concept is legally sanctioned, and then redefining the term that designates the concept to accommodate practices that have been considered to deny the concept

For example, The concepts of " biodiversity the Biodiversity convention being signed, and eventually ratified and legally binding. Industry redefined "biodiversity"

### Divergent Principle of redefining legally binding terms

“This principle involves the adopting of "environmentally correct" terms, and then redefining the terms to accommodate current practices that would violate the essence of these terms.

For example, The British Columbia Forest Resources Commission has adopted the term "ecologically sound practices" and then proceeds to claim : that "clear cut logging" in most cases was the most ecologically sound forest practice.” (Forest Resources Commission Report, 1991)

“Miller [ the Minister of Forests]concluded by announcing that the Forest Resources Commission has been asked to research and propose a Forest Practices Code. Its objective will be to ensure that the management of our forest is based on sound ecological practices and achieves the high standards we expect for stewardship” ( Press Release, January 18, 1992)

In a similar way Industry has adopted the term "old growth," and proceeded to redefine it:

“Industry is also redefining "old growth" forests.” (Press Release; January 18, 1992) {Note; Miller has recently been suspended for Conflict of Interests}

"A major problem in *settling the question* of "old growth preservation" is defining "old growth" - everyone has his or her own definition. the term "old growth" more likely describes a *biological condition* or forest environment, rather than trees of a specific age classification.

Once it is defined, the biggest problem then is that society must decide on the goal and the strategy. Preservation of land areas should be both *biologically reasonable* and *socially affordable*. Society needs to weigh the costs and benefits of all the options.

One solution could be to leave some of the new forests we are growing long enough to develop the characteristics of old growth stands. (Janna Kumi, Silviculture Research Coordinator)

Divergent Principle of self-serving misplaced categories"

Designation of "North/South dichotomy as being between the North wanting environment and the South wanting development

" developed countries"

statements from "South Group"

iv call for the establishment of a global programme for alleviating poverty in the South and for protecting or rehabilitating the environment

b. the reduction of emission, over an agreed period of time, in line with a country's quota;

(d) The creation of a global system for the transfer, on preferential and non-commercial terms, of environment-friendly technologies that would enable the South to reduce its emission of gases while pursuing a path of economic growth.

p. 1 UNCED subject matter is nothing less than the safety of the planet and the well-being and future of humankind. Its declared aim is to adopt recommendations which, if implemented, may ensure that the world and its

resources will satisfy the needs and aspirations of all human beings in an equitable, environmentally sound and sustainable manner.

#### Divergent Principle of non-effective resolve

This principle involves the criticizing of harm after having caused the harm when one was in a position to prevent it

#### Principle of non-effective commitment

Involves the proponent of harm waiting until he/she is ineffective to criticize the harm

For example: retired general becomes concerned about what he or she no longer has control over prevention

#### Divergent Principle of denying-donor

This principle involves donating to the disenfranchised and then continuing to deny equitable distribution of resources

#### 1.20. Principle of denial-donor

those who deny the inequitable distribution of resources, use words and actions to donate to the disenfranchised

McMillan Bloedel sets up a forest

Divergent principle of readjustment for error ( the Green Revolution syndrome, or the perpetuation of the technological fix delusion )

This principle involves the setting up of departments and institutions to determine the means of rectifying the harm after having permitted and continuing to permit harmful practices to occur

Because of this principle, there is the continued condoning of research and development into rectifying the harm done through ecologically unsound practices rather than discontinuing ecologically unsound practices

For example, In Sudbury, Canada, the soil has been destroyed for years, and trees have not been able to grow, because of emissions from industry. Rather than addressing

#### Divergent Principle of couched hypocrisy

This principle involves talking about the care, or new found wisdom and commitment to prevent harm while continuing to carry out practices that cause harm

Divergent Principle of criticizing as a fault the very thing that the critic is responsible for

"Unfortunately, the present role of the media and of our educational institutions seems to be one that entrenches the status quo. This is partially due to the infrastructures of these institutions and their inability to keep pace with a rapidly changing world. But it is also due in part to the comfort we all feel with the familiar; all of us would like the world to operate in a way that is rational, predictable, and understandable. How do we change this attitude:

how do we help people make some sense out of the changes occurring all around them.; how do we equip people to not only become comfortable with change but to be agents for positive change." (B.C. Round Table Education Strategy, p. )

- Divergent principle of incompatible problem /solution.
- Divergent principle of benevolent camouflage
- "the two tenets of the program are "positivism" and Both sides
- Divergent Principle of principle enunciation compromise advocacy"
- Divergent Principle of non-effective resolve
- Divergent Principle of unfulfilled co-option

This principle involves the displaying the language of change while continuing to practice as usual

This principle involves the setting up of principles that the opposition would advocate and then stating that realistically these principles must be compromised

For example, in the "B.C. Round Table: Education Strategy", prepared by private consultants for British Columbia Round Table on Economy and Environment) , they enunciate strong principles and then indicate that realistically there will have to be trade-offs.

#### Sustainability report

- A sustainable British Columbia will have as its objectives: the preservation of biodiversity; the protection of pure water, clean air and uncontaminated terrestrial, wetland, coastal and sea-bottom systems; the stabilization of global climactic conditions; the protection of natural beauty that we value aesthetically and spiritually; and a commitment to a new economic ethic based on making better use of what we have.

A new style of 'doing business' will have to include:

- A new order of urban design that reduces the need for energy-intensive transportation, integrates green space, and enhances our sense of community.
- Forestry and agricultural practices that protect soil, water and nutrient cycles
- Land-use planning that preserves prime agricultural and forest lands and protects wilderness areas and wildlife habitat, while providing, working capacity for development.

- A vibrant and dynamic economy, in which ingenuity is focused on qualitative--rather than quantitative --growth, and in which the full value of environmental assets and the impacts of human activities are considered

\*A new harmony with First Nations people in which aboriginal rights and self-determination have been resolved

\*Full and satisfying participation in decision-making, with local and individual empowerment

- A social support structure that eliminates the fears of hunger, sickness, alienation and lack of opportunities for education and personal fulfillment

- Health that is measured in degrees of wellness rather than sickness; a standards of living that is measured by quality of life rather than by level of consumption

In summary, we will have realized our absolute dependence on planet earth and will have adopted the ethic of sustainability for our collective survival.

- Limit our impact on the living world to stay within its carrying capacity ( its ability to renew itself from natural and human impacts)
- Preserve and protect the environment ( conserve life support systems, biological diversity, and renewable resources
- 8 Hold to a minimum the depletion of non-renewable resources
- Promote long-term economic development that increases the benefits from a given stock of resources without drawing down on our stocks of environmental assets (through diversifying and making resources use more efficient)
- Meet basic needs and aim for a fair distribution of the benefits and the costs of resources use and environmental protection
- Promote values that support sustainability (through information and education)

### Applying the Principles

“Principles are meant to act as guidelines to shape provincial policy and to test the wisdom of our decisions and actions. However, applying the principles in daily decision-making often involves making difficult choices and compromises. In order to balance environmental, social and economic values fairly, trade-offs between human activities and the principles will be inevitable.” ( Draft of Education Strategy, (September, 1992),

### Divergent Principle of usurped right to criticize

This principle involves the criticizing of proposals for not going far enough by critics who do not even live up to the proposals that they criticize

For example, the Ministry of the Environment of British Columbia returned from the Earth Summit and complained about UNCED being a failure because it did not go far enough ( Cashore, 1992, Address given at Post-UNCED Conference). Canada does not even live up to the principles enunciated at UNCED, such as the "precautionary principle," "Anti- dumping principle," or the "life-cycle approach principle"

### Divergent Principle of transferred integrity

For example, Steven Owen who was the former Ombudsman of British Columbia, is placed in the controversial position of being the Commissioner of the " Commission on Resources and Environment"

"I'm confident Stephen Owen can lead that process [CORE] in a fair, open and balanced way. The integrity he brings to this position will provide an excellent foundation for the new commission." (Harcourt, Premier of British Columbia" (January 18, 1992, in Press Release)

I am extremely pleased that Stephen Owen, with his proven track record for fairness, openness and integrity will lead this initiative. (Harcourt, Premier of British Columbia" (January 18, 1992, in Press Release)

"Divergent Principle of self-regulation or self-monitoring" or "fox in chicken coop syndrome"

This principle affirms the importance of regulating or monitoring and then allows the proponents of the activity that is to be regulated or monitored, the privilege to regulate or monitor themselves

For example, the ( International Atomic Energy Agency (IAEA ) has been given the responsibility to monitor the commercial use of nuclear energy, while at the same time they have become promoters of the use of nuclear energy {for further discussion, see Knelman and Russow, "the not-too-hidden agenda of International Atomic Agency (IAEA) at UNCED: Nukespeak, and seductive devices, dogmas, strategies and fallacies}

Divergent Principle of balance of convenience

This principle recognizes the need to prevent irreparable harm while interpreting irreparable harm in terms of balance of convenience

For example, in the updated version of " the Conduct of Civil Litigation in B. C., the following fundamental principle related to injunctions is put forth:

"The remedy [of injunction] of course, is an equitable one. ' The exercise of the equitable jurisdiction is not to be restricted by the straitjacket of rigid rules but is to be based on broad principles of justice and convenience, equity regarding the substance and not merely the facade or the shadow. It moves with time and circumstances. (Norris, J.A.) Equity is not to be presumed to be of an age past childbearing.' (Haman, J) " (Conduct of Civil Litigation in B.C., Chapter 42, August, 1991)

"If a remedy of an injunction is an equitable remedy that should move with time and circumstances, perhaps the courts could look to leaders in the international community and to documents from the body of international environmental law and convention for insight into the current time and circumstance. "(For further discussion see MacLaren, D. Proceedings from the Royal Society of Canada Conference on Global Issues, 1991)

1. Concerns about the global time and circumstance were expressed by the international community of scientists and scholars at the "Global Environment" conference sponsored by the Royal Society of Canada in Kingston , June, 1991.

Divergent Principle of integration of disparate functions

This principle involves the integrating of the functions of promoter and regulator

For example, International Atomic Energy Agency (IAEA) both promotes the use of nuclear energy and is the regulator of the use of nuclear energy

The International Atomic Energy Agency (IAEA) was initially set up in the 1960's to regulate Nuclear energy; they have, however, become one of the strongest proponents of nuclear energy. A fundamental regulatory principle of the "separation of function" is that "the agency entrusted for regulating a technology cannot be the same agency that promotes the use of that technology"(Knelman, 1975). IAEA, through its UNCED document entitled "Nuclear Techniques and Sustainable Development." acted as a major proponent, not only of the current use, but of the increased use of nuclear energy. {for further discussion, see Knelman and Russow, "the not-too-hidden agenda of International Atomic Agency (IAEA) at UNCED: Nukespeak, and seductive devices, dogmas, strategies and fallacies}

The seductive devices, strategies and fallacies used by the IAEA all draw upon the fundamental language of 'nukespeak.' Knelman (1986, 1992) has expanded on the euphemistic nature of Nukespeak: ( term first used in Hilgartner S., R. Bell, and R. O'Connor 1982)

The rule is sanitize by euphemism: political euphemism is of course older than nuclear power. How many of us recognize the "elimination of unreliable elements"? There are forbidden words in the language of civil nuclear power. For example, the words "accident", "pollution" or "disease" are never used. Accidents are either "transients" events, "significant events," "anomalies," occurrences, "or "abnormal occurrences." In the extreme, they become "normal abnormalities", i.e. truth becomes lies. Explosions are "events of rapid disengagement" or "prompt criticality." Waste dumps are "residue areas". Thermal pollution becomes "thermal effects" and pollution becomes "impacts." Disease becomes "health effects." This is a euphemism for cancer and genetic malformations. And missing plutonium, which is the link to clandestine acquisition of nuclear explosives is "material unaccounted for" or simply MUF! (Knelman, 1986.)

Other names relating to nuclear accidents are criticality, nuclear excursions, abnormal evolution, normal aberration, plant transients, unnecessary ignition sources. "Nukespeak" is perpetuated through "nuclear acceptance campaigns" by the PR departments of the nuclear establishment, designed to find "palatable synonyms" for "scare words" through the use of "truth squads" in order to remove "undue public concern", create "pro-energy climate" where "technically qualified persons" would agree that nuclear power poses "no significant threat" and could be entrusted" for the timely detection of potential abnormalities, or there is "no evidence" of such threat ( as though lack of evidence is proof of assertion) and the promises that turned into

lies i.e. that nuclear power would be "too cheap to meter" providing society with "boundless energy" and save us from "freezing in the dark .", this is the language of Orwell's 1984, where peace is war and truth is a lie." ( Knelman, 1992).

Divergent Principle of misconstrued balance"

Round table

Divergent Principle of functional exclusion"

Given we have 6 official languages at the UN. but after 7 only English and in small work shops

Divergent Principle of mitigated commitment"

Divergent Principle of manifest destiny

for example: in the Museum in British Columbia.

Divergent Principle of benevolent co-option

In 1992, the Canadian Network for Environmental Education and Communication (EECOM) was formed to help educators from the formal and the nonformal sectors. It helps them network and better coordinate environmental education activities. EECOM also facilitates the identification and sharing of resources.

At ECO-ed, in October 1992, the group EECOM a network of "environmental educators" was formed; it included several front groups for industry such as Canadian forestry association,

I attended the work group that was instrumental in forming EECOM . I introduced myself indicated my concern about industry's intrusion into education. Then the others introduced themselves and most of them were associated with industry- forests and petroleum,

~1993

**( )THAT** in OCTOBER 1993 I co-wrote with Erich Swartz a paper entitled Mis-education through Rhetoric: Implications for global education Paper accepted for presentation at NARST National Association of Research into the Teaching of Science

This paper is a follow-up to the paper, "Delusion of certainty in science and technology: implications for global environmental issues," presented at the 1992 NARST Conference (National Association of Research into Science Teaching). The delusion of certainty also occurs because of the rhetoric embodied in laws that are deemed to protect the environment. The public assumes that when there are laws in place enunciating high environmental

The institutions and individuals that have been responsible for thwarting the substantial societal changes necessary to "sustain" the environment, economy and the social fabric, usurp

the rhetoric of change and offer solutions that prevent the rhetoric from being translated into action. The global environmental situation is too urgent for the international community to be content with rhetoric. We as educators must expose the discrepancy between rhetoric and action and ensure that students and the public will not be "mis-educated." The need for international awareness of the way that rhetoric is contributing to inaction is essential.

Members of the global community who are concerned about the escalation of war, the degradation of the environment, the violation of human rights, and the disregard for social justice are concerned that the Earth Summit in Rio de Janeiro did not go far enough in addressing the urgency of the global situation. There are a number of systemic constraints that have prevented real change.

Although the global community did not go far enough, there are still some strong fundamental principles that did emerge. International educators, along with other concerned members of the global community, must insist on the translating of the rhetoric of enunciated principles into convergent action.

#### *systemic Constraints preventing change*

The following "systemic constraints," appear to have prevented the global community at the Earth Summit from addressing the urgency of the global situation:

- the continued willingness to enshrine the sovereign right to exploit natural resources.
- the refusal of independent states to accept the rule of international law
- the reluctance to establish stringent international environmental standards which will guide but allow for the empowering of communities (Agenda 21, Chapter 3, (a) "Empowering Communities"
- the unwillingness to move beyond sovereign barriers to international governance
- the failure to recognize that the situation is so urgent that international environmental governance and standards have to be necessary
- the unwillingness of states to allow for a stringent monitoring program
- the reluctance to recognize that the urgency of the current global situation requires the summoning up of the international political will to move from "should" to "shall"
- the obsession with consensus which may lead to the lowest common denominator rather than striving through collaboration for the highest tenable principles
- the designation of failure made by those states, institutions and individuals who do not even live up to the moderate principles established by consensus
- the unwillingness to dispel myths and the willingness to perpetuate myths

- the revelation of a problem and the presentation of a solution which could have more disastrous or equally disastrous consequences as the problem (nuclear)
- the continued justification and rationalization about the use of ecologically unsound practices in the guise of technological fixes
- the condoning of technological fixes suggested as solutions:
 

The objective of this programme area is to undertake research to determine the effects of increased ultraviolet radiation resulting from stratospheric ozone layer depletion on the Earth's surface, and on plant and animal life in affected regions, as well as its impact on agriculture and to develop, as appropriate, strategies aimed *at mitigating its adverse effects*. (14.103 Agriculture)

A considerable number of international bodies are involved in work on *chemical safety*. In many countries work programmes for the promotion of chemical safety are in place. Such work has international implications, as chemical risks do not respect national boundaries. However, a significant strengthening of both national and international efforts is needed to achieve an environmentally sound management of chemicals. (19.3 Toxic chemicals)

" Develop regulatory and non-regulatory measures and procedures aimed at preventing the export of chemicals that are banned, severely restricted, withdrawn or not approved for health or environmental reasons, *except when such export has received prior written consent from the importing country or is otherwise in accordance with the PIC procedure*; (19.53 f Toxic chemicals)

" *The safe and environmentally sound management of radioactive wastes*, including their minimization, transportation and disposal, is important, given their characteristics. In most countries with a substantial nuclear power programme, technical and administrative measures have been taken to implement a waste management system. In many other countries still only in preparation for a national nuclear programme or having only nuclear applications, such systems are still needed (22.2. Radioactive wastes)
- the presence and use of international short-term economic regulations which justify the abandoning by sovereign states of high ecological standards. (Present in GATT regulations, and evident in Chapter 2 of Agenda 21 "Social and Economic Dimensions.")
- the persistence of the situation whereby the power to prevent environmental harm or to preserve environmental heritage resides in those whose interest it is to benefit economically from the environment. and that in whose interest it is to benefit economically from the environment tend to ignore ecologically sound practices
- the persistence of the co-option, often through government funding, of groups, whose role should be to act as the conscience of the official decision makers
- the persistence of the situation where those who should be speaking out are constrained because of professional commitments, and where those who are willing to speak out are not heard because the press fails to report their statements
- the sanctioned use of "words of delusion" that either delude the public into thinking that what is unsafe, is safe, or delude the public into thinking that there is the political will to eliminate unsafe practices.
- the sanctioned use of loophole vague terms like "as appropriate" or of loophole provisions like without *prejudice to international trade principles*. For

example, in the following section on consumption They should therefore review the purchasing policies of their agencies and departments so that they may improve, where possible, the environmental content of government procurement policies, *without prejudice to international trade principles*. (4.23, Consumption)

- the sanctioned use of the "notwithstanding clause" device. This device allows for the indulging in strong statements about deep concern and the need for significant change and then including a notwithstanding clause that negates the strong statement.

" Implement, as a matter of urgency, *in accordance with country-specific conditions and legal systems*, measures to ensure that women and men have the same right to decide freely and responsibly on the number and spacing of their children and have access to the information, education and means, as appropriate, to enable them to exercise this right *in keeping with their freedom, dignity and personally held values, taking into account ethical and cultural considerations*. (3.8 j Combating Poverty)

- the sanctioned use of oxymorons like "the environmentally sound management of hazardous wastes" (20.22 Hazardous wastes) or "the promoting the safe and environmentally sound management of radioactive wastes" (Chapter 22 Radioactive wastes)

- the sanctioned use of term like "harmonizing" which usually leads not the highest tenable principles but to the lowest common denominator

- the unwillingness to redefine development in terms of ecologically sound practices; such as

- (i) the degree to which a state has been able to integrate with the ecosystem through ecological sound practices causing its human activity to have little deleterious impact on the environment

- ii) The degree to which there is an equitable distribution of resources

- iii) the extent to which a state refrains from contributing to global ecological or military harm

- iv) The degree of condemnation, and avoidance of over-consumption

- v) the ability to minimize the human impact on the environment through stabilization of population

- vi) the degree of compliance with the enshrining of positive rights (right to ecologically sound work, to food, to shelter as well as with negative rights)

- (vii) the ability to live within the carrying capacity of the ecosystem; in which case the US could possibly be the least developed

- the stereotyping of countries into categories of "developed, underdeveloped, and developing" rather than designating behaviours and attitudes as being "developed, underdeveloped and developing";

- the presumption that technological transfer should always pass from "North" to "South"

- the reluctance to deal with essential issues such as the link between "Nuclear civil reactors and Nuclear Arms Industry" or the Link between Poverty and lack of universal "secondary" as well as "primary" health care system (3.6. e Combating Poverty)

("Systemic Constraints preventing change," Russow & White, in progress)

Although there were systemic constraints which prevented UNCED from addressing the urgency of the global situation, there were many significant acknowledgements and principles which emerged from UNCED.

*Acknowledgements and principles, from UNCED, that could facilitate change*

“Although many of the above constraints appear to have influenced the ability of the global community to address the urgency of the global situation, there are many internationally adopted acknowledgements and principles arising out of UNCED that do express the global condemnation of ecologically unsound practices (see Russow, J. Content analysis of Agenda 21 and of Rio Declaration). The principles emerging from UNCED could reflect a convergence or a divergence between expressed concern and action. If there is now the international political will to at least adhere to the few strong principles emerging from UNCED then there will be concurrence. If, however, there is a divergence between expressed concern and action, then little real change will occur.

One of the roles of international educators could be to build on the strong international principles that emerged from the UNCED documents. Normally educators believe that they are mandated to "present both sides," of an issue. Perhaps now, in 1992, given the recognition of increased urgency

the threats to the biosphere which sustains all life on this planet have increased in rate, magnitude and scale that inaction is negligent. The international community has enough information about the pending state of ecological irreversibility that it must act immediately.” (Resolution, from Path to Brazil Resolutions, and also adopted in the NGO Earth Charter)

“Educators can develop curriculum around internationally adopted fundamental principles without being perceived as indoctrinating students” [For further discussion see Russow, J. (1985,1992) “A Mode of Instruction: Principle- issue analysis”].

Another role of international educators could be to expose what could be designated as "divergent principles." Divergent principles are those "principles" that arise when there is a discrepancy between the expressed concern and the actions proposed to address these concerns: A gap between rhetoric and action

In this paper the process of exposing "Divergent principles" has been illustrated. The following Divergent Principles have been abstracted from concern/actions drawn from international law, national law, and industrial practices.

A long-standing systemic constraint is the "rhetoric that purports to address the urgency but is never translated into action.

### **Divergent principle of shelved commitments**

This principle involves the making of strong recommendations but failing to summon up the political will to carry out the recommendations.

IN 1972, WE SAID, recognizing our ignorance  
Declaration of the United Nations Conference on the Human Environment  
(1972)

- A point has been reached in history when we must shape our actions throughout the world with a more prudent care for their environmental consequences. Through ignorance or indifference, we can do massive and irreversible harm to the earthly environment...
- Man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well-being, and he bears a solemn responsibility to protect and improve the environment for present and future generations (Principle 1)
- Man, and his environment must be spared the effects of nuclear weapons and all other means of mass destruction. States must strive to reach prompt agreement, in the relevant international organs, on the elimination and complete destruction of such weapons (Principle 26)

IN 1982, WE WERE STILL SAYING,  
World Charter of Nature (1982)

- Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature, and where potential adverse effects are not fully understood, the activities should not proceed (11 b)
- Activities which are likely to cause irreversible damage to nature shall be avoided (11. a)
- All areas of the earth, both land and sea, shall be subject to these principles of conservation; special protection shall be given to unique areas, to representative samples of all the different type of ecosystems and to the habitats of rare or endangered species (3)
- Every form of life is unique, warranting respect regardless of its worth to man, and to accord other organisms such recognition, man must be guided by a moral code of action (a)
- Knowledge of nature shall be broadly disseminated by all possible means, particularly by ecological education as an integral part of general education. (16)
- Military activities damaging to nature shall be avoided (Principle 20)

NOW IN 1992, WE ARE SAYING AGAIN, with knowledge

“Humanity stands at a defining moment in history. We are confronted with a perpetuation of disparities between and within nations, a worsening of poverty, hunger, ill health and illiteracy, and the continuing deterioration of the ecosystems on which we depend for our well- being” (Agenda 21, Preamble, 1.1)

Rio Declaration (1992)

- “States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health” (Principle 14)
- “In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation”. (Principle 15)

## Agenda 21

- “The growth of world population and production combined with unsustainable consumption patterns places increasingly severe stress on the life-supporting capacities of our planet (Agenda 21, 5.2)
- “Forests worldwide have been and are being threatened by uncontrolled degradation and conversion to other types of land uses... and environmentally harmful mismanagement including...unsustainable commercial logging...and the impacts of loss and degradation of forests are in the form of soil erosion; loss of biological diversity, damage to wildlife habitats and degradation of watershed areas.” (Agenda 21, 11.12)
- “Despite mounting efforts over the past 20 years, the loss of the world's biological diversity, mainly from habitat destruction, over-harvesting, pollution and the inappropriate introduction of foreign plants and animals has continued” (Agenda 21, 15.3)
- “Many of the problems have arisen from a development model that is environmentally destructive and from a lack of protection.” (Agenda 21, 18.45)
- “Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally persistent wastes at unprecedented rates” (Agenda 21, 21.7)
- “Environmentally sound waste management must go beyond the mere safe disposal or recovery of wastes that are generated and seek to address the root cause of the problem by attempting to change unsustainable patterns of production and consumption.” (Agenda 21, 21.4)
- “Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment ”(Agenda 21, 17.23b)
- “Apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it” (Agenda 21, 17.23)
- “...Taking into account the cradle-to-grave approach to the management ”(Agenda 21, 20.20)
- “to promote a 'culture of safety' in all countries...” (Agenda 21, 7.60)
- “Develop application of responsible care approach...” (Agenda 21, 20.18)
- “...taking into account entire life cycle ”(Agenda 21, 19.45)
- “...equitable implementation of the polluter pays principle” (Agenda 21, 20.39 b)
- “Effective prevention requires action through effective monitoring and the enforcement and imposition of appropriate penalties” (Agenda 21, 20.20)
- “To increase the availability. in developing countries for utilizing and producing environmentally [safe and] sound renewable energy resources, such as solar, wind geothermal, hydropower and biomass.” (Agenda 21, 9.9)

- “Indigenous people and their communities shall enjoy the full measure of human rights and fundamental freedoms without hindrance or discrimination” (agenda 21, 26.1)

“Indigenous people and their communities have an historical relationship with their lands and are generally descendants of the original inhabitants of such lands. In the context of this chapter the term "lands" is understood to include the environment of the areas which the people concerned traditionally occupy. Indigenous people and their communities represent a significant percentage of the global population. They have developed over many generations a holistic traditional scientific knowledge of their lands, natural resources and environment. Indigenous people and their communities shall enjoy the full measure of human rights and fundamental freedoms without hindrance or discrimination. Their ability to participate fully in sustainable development practices on their lands has tended to be limited as a result of factors of an economic, social and historical nature. In view of the interrelationship between the natural environment and its sustainable development and the cultural, social, economic and physical well-being of indigenous people, national and international efforts to implement environmentally sound and sustainable development should recognize, accommodate, promote and strengthen the role of indigenous people and their communities.” (Agenda 21, 16.1)

“In full partnership with indigenous people and their communities, Governments and, where appropriate, intergovernmental organizations should aim at fulfilling the following objectives”:  
(Agenda 21, 16.3)

(a) Establishment of a process to empower indigenous people and their communities through measures that include:

(i) Adoption or strengthening of appropriate policies and/or legal instruments at the national level;

(ii) Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate;  
recommendations

“States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health.” (Rio Declaration, Principle 14)

“In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.” (Rio Declaration, Principle 15)

“National authorities should endeavour to promote the internalization of environmental costs and the use of economic instruments, taking into account the approach that the polluter should, in principle, bear the cost of pollution, with due regard to the public interest and without distorting international trade and investment.” (Rio Declaration, Principle 16)

Canada violates or ignores international environmental documents to which it has been a signatory while deluding the world community into thinking that it is genuinely concerned about the environment.

At the press conference given by Federal Minister of the Environment, Jean Charest at the UNCED conference in Rio, a representative of the United Nations introduced Charest as being from a country which was truly concerned about the environment. During the question period I indicated that UNCED should be a time to dispel myths not perpetuate them and that Canada is not an ecologically sound country and that we should be honest with the rest of the world

Evidence that could dispel the myth that Canada is truly concerned about the environment has been occurring for years throughout B.C. in the forest industry, and is occurring currently in the dispute in Clayoquot Sound.

Rather than the courts in Canada insisting on adherence to international environmental documents such as the World Charter of Nature (UN Resolution 37/7, 1982) or to the current Convention on Biological Diversity (1992), Canadian courts condemn those who strive to call for the adherence to international law (environmentalists), and condone those who ignore International Law. (industry).

For Example, Canada is a signatory of the World Charter of Nature, 1982 (UN resolution 37/7) which states the following:

11. Activities which might have an impact on nature shall be controlled, and the best available technologies that minimize significant risks to nature or other adverse effects shall be used; in particular;
  - a) all activities which are likely to cause irreversible damage to nature shall be avoided;

c) Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed;

Have governments in Canada since 1982 "avoided" industrial activities such as ecologically unsound "logging practices that have caused irreversible damage to nature.? Have governments in Canada called upon forest companies to not proceed with ecologically unsound practices whose adverse effects are not fully understood?

In 1992, Canada is now a signatory of the Convention on Biological Diversity which notes the following:

that it is vital to anticipate, prevent and attack the causes of significant reduction or loss of biological diversity at source.

also, where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat

Is Canada reducing the loss of biological diversity at the source, when it is prepared to log old growth forests before it has carried out adequate non-arm's length research into the true biodiversity of the old growth forests? Is there not strong enough evidence in place that clear-cut logging has destroyed biodiversity, yet we appear to wait for "scientific certainty" before we are prepared to avoid or minimize such a threat? By that time there may be very little biodiversity left.

At the Press Conference where Mulroney signed the Convention on Biological Diversity in Rio de Janeiro, I asked him " if the signing of this document would mean that the government of Canada would condemn ecologically unsound practices such as clear-cut logging that destroy biodiversity." He replied that "he did not want to deal with issues "

If Mulroney is willing to sign a document professing to adhere to the preservation of biodiversity, and if he is not willing to deal with the practices that contribute to the loss of biodiversity, then the Canadian public will have to bring this discrepancy between rhetoric and action to the attention of the international community.

The environmentalists who have continually been striving to preserve the little remaining old growth forests, and to call for the need to identify and do research into biodiversity are the ones who have been adhering to the principles enunciated in the United Nations' World Charter of Nature. They will also be the ones who are calling for the preservation of the old growth areas so that Canada will be able to adhere to the binding principles enunciated in the United Nations Convention on Biological Diversity. Yet it is those who act

to prevent "irreversibility" that are prosecuted as criminals, and those who cause 'irreversibility" that are protected by Canadian courts

I have analyzed statements in the following Government of Canada statutes and attempted to extract and categorize general principles underlying these statements:

The Atomic Energy Control Act, R.S. C A-19, S 1  
The Emergency Preparedness Act, 1988, C 11.  
The Canadian Environmental Protection Act, 1988, C 22.  
The Environmental Contaminants Act, 1974-75-76, C 72.  
The Fisheries Act, 1977, C 35  
The Department of the Environment Act, R.S., C 14 (2nd Supp.), s2  
The Government Organization Act 1979, C 13  
The Hazardous Products Act, R.S., C H-3, S 1

In all the statutes, which I examined, dealing with either hazardous materials or the pollution caused by hazardous materials, importance is placed on the determination of the safety of the hazardous materials. And it is recognized that in order to determine safety, it is necessary to have information about the materials and their uses. This principle is enunciated in the following examples drawn from the statutes.

a) In section 11 (Disclosure) of the Hazardous Products Act, "disclosure of information is required where the Minister has reason to believe that a product or substance may be dangerous... The Minister may send a written notice to the manufacturer of the product or substance requesting the manufacturer to disclose to the Minister the formula, composition or chemical ingredients of the product or substance and such other information in the possession of the manufacturer as the Minister deems necessary for the purpose of determining whether the product or substance is or is likely to be a danger to the health or safety of the public."(The Hazardous Products Act. R.S., CH-3, S 1)

b) Pursuant to 7 (2) Of the Environment Contaminants Act "where the Minister of National Health and Welfare believes that a substance will constitute a significant danger to human health or the environment, the Minister may send a written notice to any person engaged in any commercial, manufacturing or processing activity involving the substance or any member of a classes of substances of which the substance is a member requiring that person to furnish the Minister with such information specified in the notice." (The Environmental Contaminants Act. 1974-75-76, C 72)

c) Section 33. 1 of the Fisheries Act states the following:  
"Every person who carries on or proposes to carry on any work or undertaking those results or is likely to result in

a) the deposit of a deleterious substance in water frequented by fish or in any place under any conditions where that deleterious substance or any other deleterious substance that results from the deposit of that deleterious substance may enter any such water, or

b) the alteration, disruption or destruction of fish habitat shall on the request of the Minister... (a) provide the Minister with such plans, specifications, studies, procedures, schedules, analyses, samples or other information relating to the work or undertaking and with such analyses, samples, evaluations, studies or other information relating to the water, place or fish habitat that is or is likely to be affected by the work or undertaking as will enable the Minister to determine

c) whether there is or is likely to be a deposit of a deleterious substance by reason...d) whether the work or undertaking results or is likely to result in any alternation, disruption or destruction of fish habitat.”

(Federal Fisheries, 1977, C. 35)

e) In section 5 Department of the Environment Act  
“The Minister in exercising his powers and carrying out his duties and functions under section 4 shall...  
5(ii) ensure that new federal projects, programs and activities are assessed early in the planning process for potential adverse effects on the quality of the natural environment and that a further review is carried out of those projects, programs, and activities that are found to have probable significant adverse effects and the results thereof taken into account”,

f) Furthermore, in Section 2 of the Environmental Contaminants Act consideration is given to effects that are persistent and cumulative:

“(iii) the extent to which the substance or any class of substances of which it is a member can become dispersed and will persist in the environment.

(iv) the ability of the substance or of any class of substances of which it is a member to become incorporated and to accumulate in biological tissues and to cause biological change.” (The Environmental Contaminants Act. 1974-76)

8. That the principle is set out in the regulations related to the Atomic Energy Board Act that extreme precautions must be taken in the transport of atomic materials:

a) “\*(2) Any person who transports or causes to be transported any radioactive material ...” (See Exhibit A for the list of stipulated regulations for atomic materials)

9. That the principle is expressed in the Emergency Preparedness Act that the government has a duty to make extensive provisions for civil emergency preparedness

### **Divergent Principle of accumulated appeasements**

This principle involves the participating in conferences, conventions, round tables that examine a particular issue and knowing that delay dispels criticism

### **Divergent principle of managed conception**

This principle involves the offering of a new vision by destroying of what exists so that it will no longer even be conceived

Principle of destroying what exists to eliminate its conception [to deny its prior existence]

involves the destruction of what exists so that it will not even be conceived

For example, if the old growth forests were destroyed the conception of the old growth forest would be the "managed" forest of industry.

Principle of management of conception of preservation

involves the creation usually through a diorama in museum of what one wants to bring into existence

"A major problem in *settling the question* of "old growth preservation" is defining "old growth" - everyone has his or her own definition. the term "old growth" more likely describes *a biological condition* or forest environment, rather than trees of a specific age classification.

Once it is defined, the biggest problem then is that society must decide on the goal and the strategy. Preservation of land areas should be both *biologically reasonable* and *socially affordable*. Society needs to weigh the costs and benefits of all the options.

One solution could be to leave some of the new forests we are growing long enough to develop the characteristics of old growth stands. (Janna Kumi, Silviculture Research Coordinator) [they have eliminated the concept of an old growth forest being an area where there has been no human intervention)

### **Divergent principle of fulfillment illusion**

This principle involves the stating of objectives but knowing that fulfillment is impossible

### **Divergent Principle of non-enforceability**

This principle involves the agreeing to anything providing that it will not be enforceable

### **Divergent principle of excluded alternative**

This principle involves the claiming to consider an alternative but then irreversibly eliminating the alternative during the period of deliberation

### **3. Talk and log syndrome**

ethical implications of violation of the "principle of fair alternative" which ensures that no action should irreversibly destroy an alternative while this alternative is purported to be seriously considered.

In the decision-making process alternatives that are purported to be under consideration are being eliminated while the decision-making process continues.

Although certain areas have been set aside, while the Commission on Resources and Environment is involving the community, logging will proceed in specific areas.

**Divergent Principle of fair unequal access**

This principle involves the asserting of equal access while affirming that some have more equal access than others  
involves access being determined in a mobility sense rather than a pecuniary sense

Everyone has access; " everyone has the right to sleep under the bridges of Paris but it is only the poor who avail themselves of that right"

**Divergent Principle of Misconstrued balance**

This principle involves expressing concern about the fairness, consensus and balance, and then failing to make a distinction between vested human interests and ecological concerns

Members on Round table

**Divergent principle exclusionary tactics or extreme exclusion**

This principle involves the lauding of the consensus process and then ensuring that the extreme views are exclude before the process begins  
For example, prior to engaging in the Consensus process for CORE, the so-called different sectors are to meet select delegates; the delegates that reflect the extremes in each group will thus be eliminated as delegates, before the delegates enter into the consensus process

**For example, during the public workshops for the Canadian "Green Plan," there were sessions with participants**

**Divergent principle of predetermine failure of consensus to justify unilateral decision**

This principle involves decision making body initiating a process of consensus, which by its composition will not achieve consensus, and then indicating that if the process does not work, the decision-making body will make the decision.  
For example, in the description of the consensus process for CORE, the premier states:

"The Commission will complete its regional planning process on Vancouver Island within 18 months. If consensus is not possible, after duly considering the Commission's public report, decisions on protected areas and the working forest will be taken by government." (Premier Harcourt, Press Release, January 18, 1992)

**Divergent principle of misapplied balance or fairness**

This principle involves the extolling of fairness and balance in the remainder while having destroyed and "managed" a large proportion of the whole  
involves the destruction of large proportion of whole and then demanding the sharing of the remainder, and extolling the unfairness of the opposition for not being willing to share or to enter into a "balanced" process

### **Divergent principle of survival rationalization**

This principle involves the extolling of the value of the work ethic to justify the causing of harm

### **Divergent Principle of Pontification (the greener than thou)**

This principle involves the undertaking to "solve " a problem that exists externally while ignoring the same problem when it exists internally [thus giving the illusion that the problem does not exist internally]

Magnanimity

Rather than address the problem locally, the state offers to address the same problem in another state thus giving the illusion that the problem does not exist in the home state.

In order to address external problem presumes that problem does not exist internally

Mulroney at UNCED promised 115 M for "managing forests in developing countries

### **Divergent Principle of commitment entailing presumption of minimum standard**

This principle involves proposing a solution to a problem whose existence depends on a much deeper problem that is not even being addressed. Brazil states it will include 'environmental education,' in the school system, conveying the impression that it has in fact a school system (Lopes, personal communication)

### **Divergent principle of flaunting the good to disguise the bad**

This principle involves the focusing on the only non-destructive part of production while ignoring the serious impacts of the predominantly destructive part of the production.

### **Divergent principle of industry-driving principle**

This principle involves the proponent of harm determining what should constitute harm

### **Divergent principle of misplaced onus of proof**

This principle requires opponents of activities that could have potentially significant adverse environmental effects to have to demonstrate harm rather than proponents of the activities having to demonstrate the safety of their activities.

### **Divergent principle of opportunistic criticism (self-servingism)**

This principle involves the phrasing and using of the criticism of the opposition to discard a term or practices and then replacing it with a term or practices that would be less acceptable to the opposition

Principle of opportunistic criticism: self servingism

involves using the criticism of the opposition to discard a term or practices and then replacing it with a term or practice that would be more despicable to the opposition

statement of the Round Table

Sustainable development

replaced with "sustainability"

" One of the most important findings of the British Columbia r

Round Table's initial series of public consultations was that the use of the term 'sustainable development' was problematic. As in the rest of the world, British Columbians had difficulty accepting the Brundtland Commission's definition of this term and the Round Table found that the debate surrounding this definition often detracted from the development of a proactive strategy designed to meet British Columbia's needs. As result of the apparent contradiction between 'sustainable ' (meaning capable of being maintained) and "development" (implying expansion and growth), the Round Table has chosen to adopt the simpler term of 'sustainability' (meaning a process or a state that can be maintained indefinitely).

### **Divergent principle of delusion of solution**

This principle involves the offering of a solution that is either equally as bad as or worse than the problem it was intended to solve

#### 1.4. "Principle of delusion of solution"

Making strong statements and then offering a solution that is worse than the problem,

IAEA document

### **Divergent principle of the dogma of “flamboyant absurdity”**

This principle carries the concerns of one's opponents to the point where the regulations governing the opponent's concerns should become the standard by which other potentially lesser concerns will be addressed.

For example, the IAEA appears to advocate that, what is considered to be the most dangerous industry, just because it is dangerous, has developed stringent standards, and that they who contribute to possibly the greatest uncontrollable hazard are the ones who should assist the community in dealing with other hazards.

“The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary and are so well founded in science and so widely accepted that they are now also being regarded as a source of guidance in controlling pollutants and impacts arising from other human activities. Their wider application would undoubtedly contribute towards sustainable development.” (p.2)

### **Divergent principle of "justification through dire consequences of alternatives" device**

This device involves the revealing of the dire consequences of the current practices and offering one own practice as the salvation for the problem

In the following statement the IAEA cites the dire consequences of the other alternatives to justify their proposed alternative:

“The problem of acid rain, which is linked to emissions from the burning of fossil fuels, has been recognized for decades..... the primary concern about the continued and increasing use of fossil fuels is the problem of CO<sub>2</sub> emission and the potential impact on world climate..... World conference on the Changing Atmosphere... need to reduce CO<sub>2</sub> emission (IAEA document, p. 5)  
climate change in connection with fossil fuels” (p. 9)

### **Divergent principle of the “benevolent outcome exploitation” strategy**

This strategy involves the selection of the outcome which the opposition to the proposed alternative would advocate and the subsequent attempt to demonstrate that the proposed alternative, which the opposition would condemn, would be the best way of achieving that outcome.

In the following statements from the IAEA document, the IAEA focuses on the desired outcomes of reducing acid rain and limiting greenhouse gas to justify the selection of their proposed alternative:

“Several governments have already made commitments to reduce carbon emission, while recognizing that this will be hard to achieve except through drastic policy decisions in the energy sector.” (IAEA Document, 1992, p.6)

“Nuclear power plants in normal operations cause very little environmental detriment and are beneficial when they replace plants which would emit CO<sub>2</sub>, SO<sub>2</sub>, and NO<sub>2</sub> (p. 12). In this respect they would help to reduce acid rain and limit greenhouse gas emissions” (IAEA Document 1992, p. 12)

### **Divergent Principle of usurpation of opponents desired consequences**

This principle involves the commiserating with the opponent's concern and then showing how the opponent's position would deny the concern  
"Principle of usurpation of opponents desired consequences"  
involves the selection of the opponents concern and then showing how the opponent's position would deny the opponents' concern  
For example, The Fraser Institute of British Columbia is against rent controls. To support their opposition, they indicate how rent controls would contribute to discrimination (something that the opponent would be concerned about)

## **Divergent Principle of vested interest altruism or blatant visual misrepresentation**

This principle involves the portrayal or depiction of an idyllic state disguising vested interest or ecologically unsound practices, visually or verbally. For example, in the development plans presented by the Forest Companies, industry depicts a fawn, a single logger in the Forests and a clear cut the size of a classroom, a blatant case of visual misrepresentation.

At the public viewings sponsored by the company and usually with a concurrent presentation by the Ministry of Forestry, there are usually presentations of plans (verbal-graphic imagery) indicating what is to be done accompanied by visual representations (visual imagery) of what they claim will occur. I have noticed that there is a disjunction between the presentation of plans and the visual representation of these plans. In the visual representation are often scenes of fawns in the forest, a logger with a saw in an area that appears to be fully treed, and a photograph of a clear-cut area that gives the impression of being not much larger than a class room. I as a member of the public have been initially intimidated by the complexity of the plans and look to the visual representation for clarification and simplification of the information. In the plans there is evidence of large areas of clear cut but in the visual representation there is usually no visual evidence of road blasting, of construction extensive road building, of miles of deforestation caused by clear-cut, of broadcast burns, or of non-productive planted areas that pass for reforestation. I felt that while I had been asked to attend the public process viewings, I do not feel that I have been presented with the real alternatives: I was left with the impression that the companies have been allowed to use whatever visual images they wish in order to inform and communicate with the public, regardless of whether the visual images correspond to what is actually being done. I also noticed that at several sessions the Ministry of Forestry and the Ministry of Fisheries were in attendance with their own visual representation. When they were present, they also depicted scenes of wilderness. I felt that I had been visually misled by not only the forest companies but also by the government departments that are supposed to be monitoring the forest companies in the public interest.

2. Another example of visual/verbal misrepresentation is present in the juxtaposition of the actual forests. (Visual imagery) and the interpretation of what the visual image represents (verbal imagery). On a trip through the Cowichan Valley, I noticed an example of a lush second growth forest. On the road in front of this lush second growth, Fletcher Challenge has placed a sign that reads "Fletcher Challenge, naturally seeded, 1920." This juxtaposition between the lush second growth forest and the sign is another example of verbal/visual misrepresentation. Fletcher Challenge neglected to mention on the sign that this lush second growth forest is not the outcome of their current forest practices, and that the only reason that this second growth stand, is so lush is that it was logged at a time when there was minimal construction of roads, when there was no full-scale clear-cut, and when there was no prescribed burn and when it was not replanted in off-site monoculture.

### **Divergent principle of silken transition**

This principle involves the expression of deep concern before launching into the real agenda, so that the reader is ready for acceptance

For example

"Surveys have shown clearly the concern of Canadians for their environment: but patterns of behaviour that spring from generations of rising expectations and assumptions of inevitable economic growth are slow to change. Environmental security and job security often seem to be in conflict."

The key is education: first, to transform public concern into appropriate decision making and action; second, in the longer term, to help new generations to understand the interdependence of ecology and economic development, to acquire the skills to find the balance between them, and to develop the commitment to participate in the search for a more sustainable future.

"Learning for a sustainable Future:" A sustainable Development Education Program. affiliated with the Conference Board of Canada.

Industry Association Contact Meetings - members of the Board of Directors and Conference Board staff held a series of meetings with major industry associations to ask them to promote the program with their member companies. These member companies will be approached for the private sector portion of the program funding in 1992. Association involvement was seen as a critical part of the legitimization process for the companies.

### **Divergent Principle of entailment of presumed minimum**

this principle involves undertaking to address a problem that is dependent upon a more serious problem that is not addressed

### **Divergent Principle of redefining legally binding terms**

This principle involves the recognition that it is important that a concept is legally sanctioned, and then redefining the term that designates the concept to accommodate practices that have been considered to deny the concept

For example, The concepts of " biodiversity  
the biodiversity convention being signed, and eventually ratified and legally binding. Industry redefined "biodiversity"

### **Divergent Principle of redefining legally binding terms**

This principle involves the adopting of "environmentally correct" terms, and then redefining the terms to accommodate current practices that would violate the essence of these terms.

For example, The British Columbia Forest Resources Commission has adopted the term "ecologically sound practices" and then proceeds to claim: that "clear cut logging" in most cases was the most ecologically sound forest practice." (Forest Resources Commission Report, 1991)

Miller [ the Minister of Forests] concluded by announcing that the Forest Resources Commission has been asked to research and propose a Forest Practices Code. "Its objective will be to ensure that the management of our forest is based on sound ecological practices and achieves the high standards we expect for stewardship "(Press Release, January 18, 1992)

In a similar way Industry has adopted the term "old growth," and proceeded to redefine it:

Industry is also redefining "old growth" forests. (Press Release; January 18, 1992) {Note; Miller has recently been suspended for Conflict of Interests}

"A major problem in *settling the question* of "old growth preservation" is defining "old growth" - everyone has his or her own definition. the term "old growth" more likely describes a *biological condition* or forest environment, rather than trees of a specific age classification.

Once it is defined, the biggest problem then is that society must decide on the goal and the strategy. Preservation of land areas should be both *biologically reasonable* and *socially affordable*. Society needs to weigh the costs and benefits of all the options.

One solution could be to leave some of the new forests we are growing long enough to develop the characteristics of old growth stands." (Janna Kumi, Silviculture Research Coordinator)

### **Divergent Principle of self-serving misplaced categories"**

Designation of "North/South dichotomy as being between the North wanting environment and the South wanting development

" Developed countries"

statements from "South Group"

iv call for the establishment of a global programme for alleviating poverty in the South and for protecting or rehabilitating the environment

b. the reduction of emission, over an agreed period of time, in line with a country's quota;

(d) The creation of a global system for the transfer, on preferential and non-commercial terms, of environmentally-friendly technologies that would enable the South to reduce its emission of gases while pursuing a path of economic growth.

p. 1 UNCED subject matter is nothing less than the safety of the planet and the well-being and future of humankind. Its declared aim is to adopt recommendations which, if implemented, may ensure that the world and its resources will satisfy the needs and aspirations of all human beings in an equitable, environmentally sound and sustainable manner.

### **Divergent Principle of non-effective resolve**

This principle involves the criticizing of harm after having caused the harm when one was in a position to prevent it

Principle of non-effective commitment

Involves the proponent of harm waiting until he/she is ineffective to criticize the harm

For example: retired general becomes concerned about what he or she no longer has control over prevention

### **Divergent Principle of denying-donor**

This principle involves donating to the disenfranchised and then continuing to deny equitable distribution of resources

1.20. Principle of denial-donor

those who deny the inequitable distribution of resources, use words and actions to donate to the disenfranchised

Mc Millan Bloedel sets up a forest

### **Divergent principle of readjustment for error** (the Green Revolution syndrome, or the perpetuation of the technological fix delusion)

This principle involves the setting up of departments and institutions to determine the means of rectifying the harm after having permitted and continuing to permit harmful practices to occur

Because of this principle, there is the continued condoning of research and development into rectifying the harm done through ecologically unsound practices rather than discontinuing ecologically unsound practices

For example, In Sudbury Canada, the soil has been destroyed for years, and trees have not been able to grow, because of emissions from industry.

Rather than addressing

### **Divergent Principle of couched hypocrisy**

This principle involves talking about the care, or new found wisdom and commitment to prevent harm while continuing to carry out practices that cause harm

### **Divergent Principle of criticizing as a fault the very thing that the critic is responsible for**

"Unfortunately, the present role of the media and of our educational institutions seems to be one that entrenches the status quo. This is partially due to the infrastructures of these institutions and their inability to keep pace with a rapidly changing world. But it is also due in part to the comfort we all feel with the familiar and like the world to operate in a way that is rational, predictable, and understandable. How do we change this attitude: how do we help people make some sense out of the changes occurring all around them? how do we equip people to not only become comfortable with change but to be agents for positive change?" (B.C. Round Table Education Strategy)

Divergent principle of incompatible problem /solution.

## **Divergent principle of benevolent camouflage**

This principle involves the

"the two tenets of the program are "positivism" and Both sides

## **"Principle of enunciation compromise advocacy"**

### **Divergent Principle of non-effective resolve**

### **Divergent Principle of malevolent co-option**

this principle involves the displaying the language of change while continuing to practice as usual

This principle involves the setting up of principles that the opposition would advocate and then stating that realistically these principles must be compromised

For example, in the "B.C. Round Table: Education Strategy", prepared by private consultants for British Columbia Round Table on Economy and Environment), they enunciate strong principles and then indicate that realistically there will have to be trade-offs.

### Sustainability report

- A sustainable British Columbia will have as its objectives: The preservation of biodiversity; the protection of pure water, clean air and uncontaminated terrestrial, wetland, coastal and sea-bottom systems; the stabilization of global climactic conditions; the protection of natural beauty that we value aesthetically and spiritually; and a commitment to a new economic ethic based on making better use of what we have.

A new style of 'doing business' will have to include:

- A new order of urban design that reduces the need for energy-intensive transportation, integrates green space, and enhances our sense of community.
- Forestry and agricultural practices that protect soil, water and nutrient cycles
- Land-use planning that preserves prime agricultural and forest lands and protects wilderness areas and wildlife habitat, while providing, working capacity for development.

- A vibrant and dynamic economy, in which ingenuity is focused on qualitative- rather than quantitative --growth, and in which the full value of environmental assets and the impacts of human activities are considered

\*A new harmony with First Nations people in which aboriginal rights and self-determination have been resolved

\* Full and satisfying participation in decision-making, with local and individual empowerment

- A social support structure that eliminates the fears of hunger, sickness, alienation and lack of opportunities for education and personal fulfillment
- Health that is measured in degrees of wellness rather than sickness; a standard of living that is measured by quality of life rather than by level of consumption

In summary, we will have realized our absolute dependence on planet earth and will have adopted the ethic of sustainability for our collective survival.

- Limit our impact on the living world to stay within its carrying capacity (its ability to renew itself from natural and human impacts)

- Preserve and protect the environment (conserve life support systems, biological diversity, and renewable resources)
- 8 Hold to a minimum the depletion of non-renewable resources
- Promote long-term economic development that increases the benefits from a given stock of resources without drawing down on our stocks of environmental assets (through diversifying and making resources use more efficient)
- Meet basic needs and aim for a fair distribution of the benefits and the costs of resources use and environmental protection
- Promote values that support sustainability 9 through information and education)

### Applying the Principles

“Principles are meant to act as guidelines to shape provincial policy and to test the wisdom of our decisions and actions. However, applying the principles in daily decision-making often involves making difficult choices and compromises. In order to balance environmental, social and economic values fairly, trade-offs between human activities and the principles will be inevitable. (Draft of Education Strategy,” (September, 1992),

#### Divergent Principle of usurped right to criticize

This principle involves the criticizing of proposals for not going far enough by critics who do not even live up to the proposals that they criticize

For example, the Ministry of the Environment of British Columbia returned from the Earth Summit and complained about UNCED being a failure because it did not go far enough (Cashore, 1992, Address given at Post- UNCED Conference). Canada does not even live up to the principles enunciated at UNCED, such as the "precautionary principle," "Anti- dumping principle," or the "life-cycle approach principle"

#### **Divergent Principle of transferred integrity**

For example, Steven Owen who was the former Ombudsman of British Columbia, is placed in the controversial position of being the Commissioner of the " Commission on Resources and Environment"

**"I'm confident Stephen Owen can lead that process [CORE] in a fair, open and balanced way. The integrity he brings to this position will provide an excellent foundation for the new commission." (Harcourt, Premier of British Columbia (January 18, 1992, in Press Release)**

**I am extremely pleased that Stephen Owen, with his proven track record for fairness, openness and integrity will lead this initiative. (Harcourt, Premier of British Columbia (January 18, 1992, in Press Release)**

Divergent Principle of self-regulation or self-monitoring" or "fox in chicken coop syndrome"

This principle affirms the importance of regulating or monitoring and then allows the proponents of the activity that is to be regulated or monitored, the privilege to regulate or monitor themselves

For example, the ( International Atomic Energy Agency (IAEA ) has been given the responsibility to monitor the commercial use of nuclear energy, while at the same time they have become promoters of the use of nuclear energy {for further discussion, see Knelman and Russow, "the not-too-hidden agenda of International Atomic Agency (IAEA) at UNCED: Nukespeak, and seductive devices, dogmas, strategies and fallacies}

Divergent Principle of balance of convenience

This principle recognizes the need to prevent irreparable harm while interpreting irreparable harm in terms of balance of convenience

For example, in the updated version of " the Conduct of Civil Litigation in B. C., the following fundamental principle related to injunctions is put forth:

"The remedy [of injunction] of course, is an equitable one. ' The exercise of the equitable jurisdiction is not to be restricted by the straitjacket of rigid rules but is to be based on broad principles of justice and convenience, equity regarding the substance and not merely the facade or the shadow. It moves with time and circumstances. (Norris, J.A.) Equity is not to be presumed to be of an age past childbearing.' (Haman, J) " (Conduct of Civil Litigation in B.C., Chapter 42, August, 1991)

"If a remedy of an injunction is an equitable remedy that should move with time and circumstances, perhaps the courts could look to leaders in the international community and to documents from the body of international environmental law and convention for insight into the current time and circumstance. "(For further discussion see Malaren, D. Proceedings from the Royal Society of Canada Conference on Global Issues, 1991)

**1. Concerns about the global time and circumstance were expressed by the international community of scientists and scholars at the "Global Environment" conference sponsored by the Royal Society of Canada in Kingston, June, 1991.**

Divergent Principle of integration of disparate functions

This principle involves the integrating of the functions of promoter and regulator

For example, International Atomic Energy Agency (IAEA) both promotes the use of nuclear energy and is the regulator of the use of nuclear energy

The International Atomic Energy Agency (IAEA) was initially set up in the 1960's to regulate nuclear energy: They have, however, become one of the strongest proponents of nuclear energy. A fundamental regulatory principle of the "separation of function" is that "the agency entrusted for regulating a

technology cannot be the same agency that promotes the use of that technology"(Knelman, 1975). IAEA, through its UNCED document entitled "Nuclear Techniques and Sustainable Development." acted as a major proponent, not only of the current use, but of the increased use of nuclear energy. {for further discussion, see Knelman and Russow, "the not-too-hidden agenda of International Atomic Agency (IAEA) at UNCED: Nukespeak, and seductive devices, dogmas, strategies and fallacies}

The seductive devices, strategies and fallacies used by the IAEA all draw upon the fundamental language of 'nukespeak.'" Knelman (1986, 1992) has expanded on the euphemistic nature of Nukespeak:  
(Term first used in Hilgartner S, R. Bell, and R. O'Connor 1982)

"The rule is sanitized by euphemism: political euphemism is of course older than nuclear power. How many of us recognize the "elimination of unreliable elements"? There are forbidden words in the language of civil nuclear power. For example, the words "accident", "pollution" or "disease" are never used. Accidents are either "transients," "events," "significant events," "anomalies," "occurrences," or "abnormal occurrences," In the extreme, they become "normal abnormalities," i.e., truth becomes lies. Explosions are "events of rapid disengagement" or "prompt criticality". Waste dumps are "residue areas." Thermal pollution becomes "thermal effects" and pollution becomes "impacts." Disease becomes "health effects." This is a euphemism for cancer and genetic malformations. And missing plutonium, which is the link to clandestine acquisition of nuclear explosives is "material unaccounted for" or simply MUF! (Knelman, 1986.) Other names relating to nuclear accidents are criticality, nuclear excursions, abnormal evolution, normal aberration, plant transients, and unnecessary ignition sources. "Nukespeak" is perpetuated through "nuclear acceptance campaigns" by the PR departments of the nuclear establishment, designed to find "palatable synonyms" for "scare words" through the use of "truth squads" in order to remove "undue public concern", create "pro-energy climate" where "technically qualified persons" would agree that nuclear power poses "no significant threat" and could be entrusted" for the timely detection of potential abnormalities, or there is "no evidence" of such threat ( as though lack of evidence is proof of assertion) and the promises that turned into lies i.e. that nuclear power would be "too cheap to meter" providing society with "boundless energy" and save us from "freezing in the dark"; this is the language of Orwell's 1984, where peace is war and truth is a lie." (Knelman, 1992).

1.8. "Principle of misconstrued balance"

Round table

1.9. Principle of functional exclusion"

Given we have 6 official languages at the UN. but after 7 only English and in small work shops

1.10. "Principle of mitigated commitment"

to

1.13. Principle of manifest destiny

for example: in the Museum in British Columbia.

1.22. Principle of benevolent co-option

Implication for global education

Cynicism because of discrepancy between rhetoric and action.

This syndrome occurs when individuals, groups, or institutions sense that a particular direction can be particularly self-serving. In some cases, the particular direction has been advocated by individuals, groups or institutions which the

JCL s have attempted to discredit, to thwart in any pursuits, prevent access to instruments of change. When the JCL realize the self-serving aspect, they embark upon a two-prong strategy: the discrediting through misrepresentation and the feigned concern but offering a solution that would counteract the addressing of the concern

Perhaps since the members of the Round Table are only recent converts to environmental concerns, they are not aware that most concerned members of the global community have been calling for a changed vision and a shift in values and a new world view which encompasses the following, recommendations many of whom have been endorsed by international declarations, covenants, conventions and charters

6. That the principle is repeatedly seen in these statutes that the government has a duty to provide the public with crucial and essential information about the environment

- a) In section 5 of the Department of the Environment Act it is written:  
"The Minister in exercising his powers and carrying out his duties and functions ... shall...

- (iii) provide to Canadians environmental information in the public interest.” (Department of the Environment Act, R.S., R.S., C 14 ,2nd Supp., S 2)
- b) Also, in section 19 (6) of Canadian Environmental Protection Act the Minister may disclose information:
  - “Where
    - a) the disclosure is in the interest of public health, public safety or the protection of the environment and
    - b) the public interest in the disclosure clearly outweighs in importance any material financial losses or prejudice to the competitive position of the person who provided the information or on whose behalf it was provided.” (Canadian Environmental Protection Act, 1988, C 2)
- c) In section 6 of the Government Organization Act, the mandate is given:
  - “6(iii) to provide to Canadians environmental information in the public interest.” (Government Organization Act, 1979, C 13)

7. That the principles are repeatedly enunciated in these statutes that the environment is worthy of protection and that government has a duty to protect the environment and to prevent environmental harm

- a) “It is hereby declared that the protection of the environment is essential to the well-being of Canada.” (Canadian Environmental Protection Act, 1988, C 22)
- b) “Whereas the presence of toxic substances in the environment is a matter of national concern.” (Canadian Environmental Protection Act, 1988, C 22)
- c) In the Department of the Environment Act, under the division of "Powers, duties and functions of the Minister, it is stated that “the duties of the Minister include providing for
  - a) the preservation and enhancement of the quality of the natural environment, including water, air and soil quality; and to
  - 2(i) endeavour to protect the environment from the release of toxic substances.” (Canadian Environmental Protection Act, 1988, C 22)
- d) “The duty of the Federal Government is that it shall (a) take both preventative and remedial measures in protecting the environment,” (section 2, Canadian Environmental Protection Act, 1988, C 22).
  - a) “5 (1) c to provide education and training related to civil preparedness or emergencies.” (Emergency Preparedness Act, 1988, C 11)

b) "5 (1) e to analyze and evaluate civil preparedness for emergencies and conduct related research." (Emergency Preparedness Act, 1988, C 11)

( ) THAT in 1992, Dr Fred Knelman and I wrote The "Not-too-hidden agenda" of the International Atomic Energy Agency (IAEA) at UNCED: Nukespeak, and Seductive Devices, Doctrines, Dogmas, Strategies and Fallacies

By Fred Knelman and Joan Russow  
EXHIBIT

Dr Fred Knelman is the Vice President of the Whistler Foundation for a Sustainable Environment, and Joan Russow, was the delegate for the Whistler Foundation at the New York Preparatory Committee for UNCED and at the Earth Summit at Rio. The Whistler Foundation and the Nuclear Age Peace Foundation had circulated a Declaration that was signed by 37 Nobel Laureates; this declaration called for the phasing out of Nuclear energy. They requested permission to read this declaration at one of the plenary session at Rio Centro; permission was denied.

The International Atomic Energy Agency (IAEA) was initially set up in the 1960's to regulate Nuclear energy; they have, however, become one of the strongest proponents of nuclear energy. A fundamental regulatory principle of the "separation of function" is that "the agency entrusted for regulating a technology cannot be the same agency that promotes the use of that technology"(Knelman, 1975). IAEA, through its UNCED document entitled "Nuclear Techniques and Sustainable Development." acted as a major proponent, not only of the current use, but of the increased use of nuclear energy.

Agenda 21-- the 700 page far-reaching action-plan document from UNCED, was adopted unanimously by the global community represented at the Earth Summit in Rio. In Agenda 21 the following concern about radiation was expressed:

The deterioration of environmental quality, notably air, water and soil pollution owing to toxic chemicals, hazardous wastes, radiation and other sources, is a matter of growing concern.  
( Chapter 16. subsection 12),

The extent of the consequences of the nuclear industry were also identified in Agenda 21:

Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste ( as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. (Chapter 22, subsection 1)

Yet at one of the plenary sessions, Mr. Hans Blix, Director-General of the IAEA, was given permission to present a document advocating nuclear energy as being a safe alternative energy for the future. The International Non-Governmental Organizations, (NGOs), however, recognized that the fundamental regulatory principle had been violated, and gave IAEA, the dubious honour of being presented with the International NGO Community's "Most Preposterous Proposal Award" "for presenting nuclear power as the environmental solution in energy and successfully keeping its problems out of the documents."

We would like to highlight some of the SEDUCTIVE DEVICES, STRATEGIES, DOCTRINES, DOGMAS and FALLACIES that have made the IAEA worthy of this honour. The examples will be drawn from IAEA document which was prepared for UNCED. Also references will be made to other UNCED Documents such as Agenda 21 and the Rio Declaration-- the Earth Charter-- 1992, and the Canada's National Report for UNCED, 1992

The seductive devices, strategies and fallacies used by the IAEA all draw upon the fundamental language of 'nukespeak.'" Knelman (1986, 1992) has expanded on the euphemistic nature of Nukespeak:  
( term first used in Hilgartner S., R. Bell, and R. O'Connor 1982)

The rule is sanitize by euphemism: political euphemism is of course older than nuclear power. How many of us recognize the "elimination of unreliable elements"? There are forbidden words in the language of civil nuclear power. For example, the words "accident", "pollution" or "disease" are never used. Accidents are either "transients," "events," "significant events," "anomalies," "occurrences," or "abnormal occurrences." In the extreme, they become "normal abnormalities," i.e. truth becomes lies. Explosions are "events of rapid disengagement" or "prompt criticality." Waste dumps are "residue areas." Thermal pollution becomes "thermal effects" and pollution becomes "impacts." Disease becomes "health effects"; This is a euphemism for cancer and genetic malformations. And missing plutonium, which is the link to clandestine acquisition of nuclear explosives is "material unaccounted for" or simply MUF! (Knelman, 1986.) Other names relating to nuclear accidents are criticality, nuclear excursions, abnormal evolution, normal aberration, plant transients, unnecessary ignition sources. "Nukespeak" is perpetuated through "nuclear acceptance campaigns" by the PR departments of the nuclear establishment, designed to find

"palatable synonyms" for "scare words" through the use of "truth squads" in order to remove "undue public concern", create "pro-energy climate" where "technically qualified persons" would agree that nuclear power poses "no significant threat" and could be entrusted" for the timely detection of potential abnormalities, or there is "no evidence" of such threat ( as though lack of evidence is proof of assertion) and the promises that turned into lies i.e. that nuclear power would be "too cheap to meter" providing society with "boundless energy" and save us from "freezing in the dark"; this is the language of Orwell's 1984, where peace is war and truth is a lie." ( Knelman, 1992).

( ) **THAT in 1992**, I prepared a criticism of the BC Environmental Assessment Program

#### EXHIBIT

#### **1992 Principle of Environmental impact assessment should be carried out on projects likely to have significant impacts upon biological diversity**

• Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity....  
(Agenda 21, 15.5 k)

The British Columbia government has failed to insist on an environmental impact assessment on the potentially significant impact of current forest practices, such as clear-cut logging, on biodiversity. Even though, as admitted by Dale Lovick, the Chair of public hearings on the B.C. Environmental Assessment Act, the public was demanding for forest practices to be included on the list of projects and activities which should require an environmental assessment., forest practices appear to be excluded from this Act.

In jurisdictions where an environmental impact assessment has been carried out, practices, typical of those carried out currently in BC forests, have been assessed as being destructive of biodiversity. For example, a German biologist specializing in biodiversity indicated that:

The practice of clearcutting, followed by artificial reforestation has undoubtedly many technical and organizational advantages. In the course of time, however, soil scientists and ecologists found out that the practice of clearcutting automatically leads to considerable drawbacks:

- wounding of the soil surface through logging operations.
- Risk of erosion
- High irradiation and higher climatic extremes alter the microclimate, the flora and the microflora and deteriorate the growing conditions for a number of valuable tree species.
- Soil compression and a reduction of species richness
- An accelerated decomposition of organic matter occurs, combined with a wash out of nutrients, and the eutrophication of ground water, rivers and lakes occur

(Dr Schutt, Biological Department, University of Munich, Environmental Ethics Conference, 1992, Vancouver)

**Principle of full life cycle analysis of activities that could have significantly adverse effects.**

This principle if complied with in the forest industry would entail an examination of the environmental impacts of each stage of current forest practices. At UNCED there was also a call for "environmental audits", and "full environmental accounting of aspects related to life cycles of ...resources", and "for taking into account the costs of any ecological consequences."

- Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits (20.20 e)
- Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42)

A full environmental audit of current forest practices has not been undertaken in B.C. the Auditor general has not been requested by government to carry out a full-scale audit of the true costs of the current logging practices, and to compare these costs to those incurred by alternative forestry practices such as Eco forestry.

**Principle related to positive mandate-to conserve**

- Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage ... and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities"; (Agenda 21, 11.15 b)

This principle is a reaffirmation of the principle established and endorsed by Canada in 1972 in the Convention for the Preservation of Cultural and Natural Heritage.

- Noting that the cultural heritage and the natural heritage are increasingly threatened with destruction not only by the traditional causes of decay, but also by changing social and economic conditions which aggravate the situation with even more formidable phenomena of damage or destruction"
- Considering that deterioration or disappearance of any item of the cultural or natural heritage constitutes a harmful impoverishment of the heritage of all the nations of the world."
- Considering that the existing international conventions, recommendations and resolutions concerning cultural and natural property demonstrate the

importance, for all the peoples of the world, of safeguarding this unique and irreplaceable property, to whatever people it may belong"

"Considering that parts of the cultural or natural heritage are of outstanding interest and therefore need to be preserved as part of the world heritage of [humankind] as a whole"

"Considering that, in view of the magnitude and gravity of the new dangers threatening them, it is incumbent on the international community as a whole to participate in the protection of the cultural and natural heritage of outstanding universal value, by the granting of collective assistance which, although not taking the place of action by the State concerned, will serve as an effective complement thereto,"

Canada has not lived up to its international commitment to preserve a significant area of international worth: a network of intact old growth watershed, conservation corridors including Clayoquot sound (this type of extensive preservation has currently been carried out in Australia, and Australia has applied to have this network of temperate rainforests designated as an international heritage site at the recent meeting in 1993 of the World Heritage Committee at UNESCO.

4. The positive-duty-to-protect-indigenous-lands principle. This principle reads as follows:

"...recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate "(Agenda 21, 16.3. ii)

A fifth principle that came out of UNCED and was agreed to by Canada is the recognition of non-damaging-use value principle. This principle reads as follows:

"The implications of the harvesting of forest resources for other values of the forest should be taken fully into consideration in the development of forest policies. It is also possible to increase the value of forest through non-damaging uses such as eco-tourism ..." (Agenda 21, 11.22)

( ) **THAT** in 1992, I co-authored a paper criticizing the Department of Education's brief on "Towards Sustainability" as justifying corporate intrusion into education

## EXHIBIT

( ) **THAT in 1992**, I made a presentation to the Senate Committee on National Security, where I criticized the Federal government for issuing an Order in Council to permit the berthing of nuclear powered and nuclear arms capable vessels and thus to have bypassed its statutory obligations

## EXHIBIT

( ) THAT in 1992, I Submitted recommendations to the Constitutional discussions on the need to enshrine Ecological Rights in the Charter of Rights and Freedoms

( ) THAT in 1992, I was elected to steering committee of CORE

( ) SEPTEMBER 9, 1992 REVISED DOCUMENT FOR NAMI MEETING  
Theme LIVE AND LEARN, LEARN AND LIVE  
Education for an Economically Competitive and Socially Responsible North America  
• 1992 Participated on the Steering Committee of the Commission on Resource and Environment (CORE)

MOVE: meeting out at the University with two indigenous men who were arrested in Oka. One of the men . This meeting was organized by the social justice group of the Anglican church [ Contact: Susan Gage]. the man who was depicted as a terrorist juxtaposed with an innocent army officer was in fact an economics student from Uof T who had never been involved before. I talked to him after

I was invited to participate to participate in a meeting with a speaker from the Federal government who gave what he determined was the legal background for first Nations rights. I pointed out a significant omission which was the court case in 1988 McMillan vs Manson Contact: Michael Manson Friends of Clayoquot. In that Treaty process participating in the community group. In the Munson? case, the court decided that the ecological rights of the First Nations would be jeopardized if MacMillan Bloedel would be granted an injunction.

In MacMillan Bloedel vs Mullin it was decided that an injunction would not be granted because granting an injunction could deprive the native community of their "ecological rights" in the case of a pending land-title claim, and that MacMillan Bloedel would not suffer "irreparable harm"

the claim by an Indian band for 'aboriginal " title to land cannot be 'rejected summarily' and certainly not at the early stages of litigation. Nor must the right to log crown land given by licence to a logging Company be ignored. However in light of the fact that **unless the issue of title to the subject land is settled before logging occurs the Indians, if successful, will be deprived of valuable ecological rights, and in further light of**

**the fact that irreparable harm will not result to the logging Company if timber harvest is delayed pending an expedited adjudication of issue of title, the principles applicable to the issue of interlocutory injunctions will militate that the status quo. be maintained.**

We believe that because Canada has made these commitments, and because these commitments are inconsistent with the continuing to log in significant stands of unfragmented watersheds that the injunction should be rescinded because the injunction is contributing the non-fulfillment of international, national and provincial obligations.

MOVE: ATTEMPTS TO SET UP COMMON SECURITY CLUB AT THE UNIVERSITY

( ) That in 1992 OCTOBER I was selected to be on the steering Committee for CORECORE

• Attended a meeting between VINE steering Committee for VINE and CORE discussing what would be VINE'S CONDITIONS AT THE TABLE  
10 hours

( ) THAT 1992 i Submitted "Statement of Obligation: Conservation and Ecologically Sound Practices" to Conservation sector of the CORE (Commission on Resources and Environment).

EXHIBIT

SEPTEMBER 28, 1992  
1992 ANALYSIS OF THE PROPOSED DRAFT OF THE LAND USE CHARTER

LEGEND OF TYPE  
PLAIN TYPE IS FOR THE ORIGINAL CHARTER  
*ITALICS ARE FOR SECTIONS THAT ARE SUGGESTED FOR DELETION*  
**BOLD FOR SECTIONS THAT ARE DEEMED NECESSARY TO ADD**  
**[BOLD] IN BRACKETS STATEMENT OF REASONS FOR CHANGING SECTIONS**

*A Land Use Charter*

**[inappropriate name because the Charter must address land air and water.]**

**A charter of ecological preservation and ecologically safe and sound use of resources**

**•Recognizing the urgency of the current environmental situation and for the need to address the destruction of the environment, the violation of**

human rights, the disregard for social justice and the perpetuation of inequity.

•Concurring with the assessment of the current urgency as expressed in Agenda 21, we acknowledge the following:

“Erosion, degradation, deforestation and desertification have led to increased land degradation, and the creation of reservoirs has, in some cases, resulted in adverse effects on ecosystems. Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection.” (Agenda 21, 18.45)

• Convinced that it is time in British Columbia to redress the imbalance that has been caused by ecologically unsound use of land, air and water, by immediately ceasing resource use in areas that could be lost for preservation, in particular the little remaining examples of significant old growth, and in fulfillment of commitments made at the Earth Summit we shall be committed to the following:

“Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources,”  
(Agenda 21, 11.15 b., Deforestation), 1992)

• Convinced that humanity must be guided by a moral code of action to respect the inherent worth of nature, and in fulfillment of commitments made in the World Charter of Nature, we shall be committed to the following:

“...every form of life is unique, warranting respect regardless of its worth to [humans], and to accord other organisms such recognition [humans] must be guided by a moral code of action.” (a, World Charter of Nature, 1982)

• Concurring with the global commitment under the "Convention for the Protection of Cultural and Natural Heritage" (1972) to fulfil our international duty to identify and protect natural heritage for future generations:

“Each State Party to this convention recognizes that the duty of ensuring the identifications, protection,

**conservation, presentation and transmission to future generations of the cultural and natural heritage..."**  
(Convention for the Protection of the World Cultural and Natural heritage)

- **Concurring with the global commitment under the World Charter of Nature (1982) to avoid activities which are likely to cause irreversible damage to nature**

**"Activities which are likely to cause irreversible damage to nature shall be avoided; and activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponent shall demonstrate that expected benefits outweigh potential damage to nature, and where potential aversive effects are not fully understood, the activities should not proceed" (Agenda 21, section 11b)**

- **Concurring with the enshrinement of the precautionary principle and in fulfillment of commitments made in the Rio Declaration and in Agenda 21, we shall be committed to the following:**

**" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).**

- **Recognizing that causes of irreversible environmental damage may not be fully understood or predictable, and in fulfillment of commitments made in Agenda 21, we shall recognize the following:**

**"In the face of threats of irreversible environmental damage, lack of full scientific understanding should not be an excuse for postponing actions which are justified in their own right. The precautionary approach could provide a basis for policies relating to complex systems that are not yet fully understood and whose consequences of disturbances cannot yet be predicted" (Agenda 21, 35.4)**

- **Concurring with the enshrinement of the principle of prior environmental impact assessment and in fulfillment of commitments made in Agenda 21, we shall enshrine the following principle:**

**"Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences" 7.42 b**  
**" Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment; (17.23 b Marine)**

- **Concurring with the global condemnation of the transfer or relocation of harmful activities or substances, and in fulfillment of our commitments made in the Rio Declaration, we shall condemn the following:**

**“...the transfer and relocation to other states of any activities and substances that cause severe environmental degradation or are found to be harmful to human health.”(Principle 14 Rio Declaration)**

- **Concurring with the need to examine the "cradle to grave," or "full life cycle" approach to industry, and in fulfillment of our commitments made in Agenda 21, we will require and undertake the complete analysis of each industry's intervention into the ecosystem**

**should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits (Agenda 21 20.20 e)**

#### THE PROVINCIAL COMMITMENT

The government of British Columbia is committed to:

- **preserving significant representative ecosystems**, protecting and restoring the quality and integrity of the environment, and
- **ensuring *securing ecologically safe and sound employment securing a sound and prosperous economy***

This commitment is made to the people of British Columbia and to the global community. A healthy environment and **ecologically safe and sound employment healthy economy**. *are essential British Columbia. to the social, cultural, material, physical and spiritual well-being of British Columbians.* Furthermore, the Province recognizes its obligations **under various international declarations, conventions and charters, to preserve representative ecosystems**, and to protect, and manage *and use its resources and environment to fulfill its responsibility to global well-being.* **in an ecologically safe and sound way its land, air and water resources.** Finally, the Province shall ensure that present-day decisions do not compromise **the integrity and inherent worth of preserved ecosystems** and the ability of future generations to meet their own environmental and economic needs.

- **recognizing the current change in global political situation, the province will make a request to the Federal Government to transfer a substantial segment of the military budget to be used for the preservation of significant areas of land and water bodies, for allowing for the regeneration of areas that have been destroyed, for providing for the restoration of areas that have suffered environmental degradation, and for the creation of ecologically safe and sound employment through value added jobs**

- recognizing that human understanding of nature is incomplete the province will undertake to preserve significant ecosystems
- recognizing that injunctions are usually granted to prevent irreparable harm, the issuing of injunction against those who are attempting to prevent irreversible harm is untenable

## PRINCIPLES

### *Sustainable Environment*

**[the preserving of ecosystems, the engaging in ecologically safe and sound practices and the entrenching of social programs are not separated here}**

*A healthy environment is the foundation upon which a sound economy and society depend. [Ecosystems do not only have a role to support society]. The essential role that ecosystems play in supporting our society establishes an environmental imperative that must be respected in all land, resource and economic decisions. Our priority must be to maintain natural systems for present and future generations.*

**1. To redress the imbalance resulting from years of non-compliance to the spirit of international Conventions such as the Convention for the Protection and Preservation of Cultural and Natural heritage, and Charters such the World Charter of Nature (1972), the Province shall immediately preserve the little remaining significant unfragmented old growth areas for ecological heritage and for the maintenance of natural systems.**

The Province shall preserve, maintain and enhance the life-supporting capacity of air, water, land and ecosystems. The Province shall respect **and preserve** the integrity of **intact** natural systems and **will allow for regeneration** will seek to restore previously degraded environments. **The Province will concurrently transfer funds into the creation of ecologically safe and sound employment.**

**to redress the imbalance resulting from years of addressing the errors of previously ecologically unsound practices, the province shall support and fund research not into technological fixes for rectifying the harm caused by ecologically unsafe and unsound practices, but into new and viable ecologically safe and sound practices.**

**to redress the imbalance resulting from years of non-arm's length research reflecting conflict of interest, the province shall support independent non vested interest, arm's length research.**

**to redress the imbalance resulting from the misplaced onus of proof, the province shall shift the burden of proof from those opposing the intervention having to demonstrate harm to those proposing the intervention having to demonstrate the ecological safety and soundness of the intervention**

**2. The Province shall preserve significant areas that contain biodiversity and shall conserve biological diversity in genes, species and ecosystem and shall condemn, ban disallow any practices that contribute to loss of biodiversity. including current practices of clear-cut logging. The province will not permit the redefining of the term Biodiversity to accommodate ecologically unsound practices such as clear-cut logging.**

**3. The province shall attempt to anticipate and prevent adverse environmental impacts. When making land and resource decisions, the province shall exercise caution and special concern for natural values, recognizing that human understanding of nature is incomplete.**

**4. The Province shall ensure that the true environmental and social costs are accounted for prior to making a decision for a project or an activity that will affect air, water or land. in land resource use and economic to proceed the true environmental social costs will have to consider the costs required by society not only to repair the harm but also to do research into repairing the harm, and to monitor ecologically unsound practices and to enforce regulations and in assessing the true environmental costs those who have been responsible will be required to pay for past as well as present damage (polluter pay principle as enunciated in Agenda 21)**

**3.The province shall also establish high provincial standards for ecologically safe and sound practices and products taking into consideration fundamental international principles of preservation and ecologically safe and sound employment.**

**The province shall establish a series of independent panels reflecting community concern, not vested interests to attempt to establish province wide guidelines for ecologically safe and sound practices**

**The province shall establish a list of industries or industrial practices that have not been able to satisfy the ecologically safe and sound conditions of the life cycle approach and disallow these industries to function in the province**

**The province shall subject all interventions that could have a potential adverse effect to environmental assessment review**

**The province will disallow any practice that has been deemed ecologically unsound by a panel of independent, non-vested concerned body**

5. The province shall recognize its responsibility **to preserve significant representative ecosystems**, to protect, and restore the global environment

the province shall reduce consumption to sustainable levels, **engage in alternative practices that reduce consumption**, and avoid importing or exporting ecological *stresses activities or substances that could cause harm to human health or to the environment [statement in harmony with wording in the Rio Declaration]* and to help meet the global challenge of sustainably supporting the human population

**the province shall establish ecologically safe and sound working environments for all employees. No employee shall ever be dismissed from work for demanding to have ecologically safe and sound environment**

**The province shall not be required to pay compensation for the transferring of resource use into non-use or preservation reverting to the ecological commons.**

**the province shall undertake to assist with funds transferred from the military budget to convert ecologically unsound employment to ecologically safe and sound employment.**

6. the Province shall preserve and protect the environment for its inherent value and for the use and enjoyment of humans

#### *Sustainable Economy*

**[ preservation of ecosystems, and then the engaging in ecologically safe and sound practices and the entrenchment of strong social programs are not separated here}**

**The province shall recognize that the preservation of significant areas is a global requirement and is conditional not on economic development but on political will. Similarly, the willingness to ensure ecologically safe and sound employment in an ecologically safe and sound environment is all dependent on political will. The establishment of the commitment to preservation and to ecologically safe and sound employment will drive the community to fulfill these requirements.**

**Given the urgency of the current global situation, the province undertakes to ensure that employment shall be ecologically safe and sound.**

**The Province shall ensure that ecologically sound practices prevail, and will fund only appropriate technology beyond simply allowing for the prevailing of currently unsound practices.**

**The province shall ensure that ecologically unsound practices will be phased out and eventually eliminated**

**the province shall recognize that it is impossible to balance two values when the fulfillment of one is the denial of the other.**

1. The Province shall promote a dynamic and competitive **ecologically safe and sound** economy that maintains options for **land air and water preservation and ecologically safe and sound use** future land and resources uses.

**The Province shall advocate international ecologically safe and sound standards so that the province in advocating the highest tenable standards will not be at a global disadvantage**

**The Province shall make a representation to GATT to insist that high international standards be established for preservation of nature, conservation of resources, and ecologically safe and sound practices so that no action in the Province taken to address the need for ecologically safe and sound employment will be overturned as being a subsidy. For example, the decision by the province to stop the export of raw logs (as per section 135 in the Forest Act) so as to create ecologically sound employment shall not be construed as a subsidy.**

2. The Province shall encourage diversified economic development **in an ecologically safe and sound way that** increases the employment and other benefits derived from a given stock of resources.

3. The Province shall *encourage* **insist that pollution is controlled at the source and that there will be eventually zero harmful emissions into the ecosystem encourage, and shall insist on proposal for development that make ecologically safe and sound and efficient use of resources**  
*development that reduces waste and makes efficient use of resources*

4. *The Province shall encourage optimum use of natural systems and resources, consistent with their inherent capability to support our economic, social and environmental needs.* **{vacuous statement unclear what that would entail}**

5. The province shall ensure that renewable resources are used in an **ecologically safe and sound** manner **so** that they will be sustainable over the long term. **and the Province will not jeopardize long term ecological rights to natural heritage and to ecologically safe and sound employment for short-term economic gain**

6. The Province shall ensure that the use of non-renewable resources is **phased out and that funding be placed immediately into discovering**

**ecologically safe and sound alternatives (Agenda 21, Energy section)**  
avoids **avoiding** their exhaustion and addresses the needs of future generations

7. *The Province shall stimulate environmentally sound economic activity and innovation through a system of economic instruments* [ **environmental sound economic activity should not be introduced only in this section it should be a precondition for all future activity. By having it in this section it suggests that the reference to economic activity in other sections does not mean environmentally sound**]

8. the Province shall provide a regulatory framework which promotes stability and predictability for business and investment. **The Province, through the development of standards of ecologically safe and sound practices will minimize the need to monitor as the engaging in ecologically safe and sound practices will entail a different type of monitoring; a monitoring to determine if industry is engaging in these practices rather than a monitoring to determine whether the practices are having a significant adverse impact on the environment.**

### *Social Sustainability*

[ **preservation of ecosystems, and then the engaging in ecologically safe and sound practices, and the entrenchment of strong social programs are not separated here**]

Social equity requires that the concerns of individuals and communities are respected **as ecological preservation and ecologically safe and sound employment are established.** *environmental and economic needs are balanced.*

1 The Province shall aim for a fair distribution of the costs and benefits of *land use decisions about land, air and water.* **and undertake to propose measures that will bring about a more equitable distribution of resources. This could entail the giving of a guaranteed annual income to anyone who is displaced as a result of conversion to ecologically sound employment, and ensure that the person will be appropriately retrained. In this way those whose jobs have been converted will not be required to move from the community.**

2. The Province is committed to social stability, and will support economic and social measures to address the economic effects of land use decisions **These measures could entail the giving of a guaranteed annual income to anyone who is displaced as a result of conversion to ecologically**

**sound employment, and ensure that the person will be appropriately retrained. In this way those whose jobs have been converted will not be required to move from the community.**

3. The Province shall promote a good quality of life by fostering opportunities to;

\* **earn a living in an ecologically safe and sound way**

\* **obtain education and training by putting additional funding into the creation of post-secondary institutions**

\* **access social, cultural and recreation services and**

\* **enjoy a quality environment through the preservation of significant ecosystem, the creation of ecologically safe and sound employment, and the entrenching of social equity programs**

4. In addition, equity requires that land use and related resources and environmental decisions be made in a fair and open manner **without the participation of those who have a vested economic interest in not adhering to ecologically safe and sound practices**

**REXAMINATION OF THE TERMS OF REFERENCE OF CORE AND THE "LAND USE CHARTER" IN THE LIGHT OF THE TWO FOLLOWING EXTENUATING CIRCUMSTANCES;**

**1. THE REQUESTED INVESTIGATION BY THE OMBUDSMAN'S OFFICE INTO THE ENVIRONMENTAL DEGRADATION CAUSED BY THE MINISTRY OF FOREST'S NON-COMPLIANCE WITH THE FOREST ACT SECTION 60. OF INTERNATIONAL AGREEMENTS.**

In September 1991, we submitted a complaint the Ombudsman office, while Steven Owen was still the ombudsman, calling for the investigation into forest practices that were causing damage to the natural environment to support the claim we submitted a document from the Ministry of Fisheries indicating the destruction of fish habitat (a violation of section 33 of the Fisheries Act, caused by current logging practices We were notified that the complaint would be addressed.

While Steven Owen was the ombudsman little was done to investigate this complaint.

In January 1992, CORE was established, and Stephen Owen was named as the Commissioner,

in June forestry Minister, Miller, suddenly became cognizant of the degradation that had occurred through logging practices.

One of the implications of this complaint is that if the complaint is deemed justified, and if the Ministry of Forests, and industry through noncompliance with the Forest Act caused damage to the natural environment, the whole discussion of "compensation" for areas that will be taken out of TFL and put into wilderness areas will be reassessed.

## **2. THE COMMITMENTS BY CANADA TO PRINCIPLES ENUNCIATED IN INTERNATIONAL AGREEMENTS.**

practices. and calling for the enforcing of section 60 of the Forest Act was initiated prior to the completion by the Ombudsman's office  
CORE was initiated at a time prior to the deliberations of UNCED. As a result of many of the deliberations of UNCED, a few key principles emerged that need to reassess the terms of reference of CORE

Given the recognition of the urgency of the global situation  
" Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources, involving in situ and ex situ measures and undertaking supportive measures to ensure sustainable utilization of biological resources and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities;" (11.15 b., Deforestation)

"Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems."  
(18.45 Fresh water)

"There are few regions of the world that are still exempt from the problems of loss of potential sources of freshwater supply, degraded water quality and pollution of surface and groundwater sources. Major problems affecting the water quality of rivers and lakes arise, in variable order of importance according to different situations, from inadequately treated domestic sewage, inadequate controls on the discharges of industrial waste waters, loss and destruction of catchment areas, ill-considered siting of agricultural practices. This gives rise to the leaching of nutrients and pesticides. Aquatic ecosystems are disturbed and living freshwater resources are threatened...Erosion, degradation, deforestation and desertification have led to increased land degradation, and the creation of reservoirs has, in some cases, resulted in adverse effects on ecosystems. Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems. A preventive approach,

where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies.” (18.45 Fresh water)

" to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity (4.7.a Changing Consumption Patterns)

Decision making process

a distinction must be made between vested interests and public concern

1992. Co-drafted policy resolutions on peace, environment and human rights for the 1993 Convention on the NDP party

- November ? 1992 Drafted and circulated "A Charter of ecological preservation and ecologically safe and sound employment. for the Vancouver Island Network of Environmentalists (VINE). Analysis of Charter "CORE land use charter" in the context of Canada's obligations and Commitments

SEPTEMBER 28, 1992

1992 ANALYSIS OF THE PROPOSED DRAFT OF THE LAND USE CHARTER

### LEGEND OF TYPE

PLAIN TYPE IS FOR THE ORIGINAL CHARTER

*ITALICS ARE FOR SECTIONS THAT ARE SUGGESTED FOR DELETION*

**BOLD FOR SECTIONS THAT ARE DEEMED NECESSARY TO ADD [BOLD] IN BRACKETS STATEMENT OF REASONS FOR CHANGING SECTIONS**

### *A Land Use Charter*

**[inappropriate name because the Charter must address land air and water.]**

**A charter of ecological preservation and ecologically safe and sound use of resources**

**•Recognizing the urgency of the current environmental situation and for the need to address the destruction of the environment, the violation of human rights, the disregard for social justice and the perpetuation of inequity.**

**•Concurring with the assessment of the current urgency as expressed in Agenda 21, we acknowledge the following:**

**“Erosion, degradation, deforestation and desertification have led to increased land degradation, and the creation of reservoirs has, in some cases, resulted in adverse effects**

on ecosystems. Many of these problems have arisen from a development model that is environmentally destructive and from a lack of protection.” (Agenda 21, 18.45)

- Convinced that it is time in British Columbia to redress the imbalance that has been caused by ecologically unsound use of land, air and water, by immediately ceasing resource use in areas that could be lost for preservation, in particular the little remaining examples of significant old growth, and in fulfillment of commitments made at the Earth Summit we shall be committed to the following:

“Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources, (Agenda 21, 11.15 b., Deforestation),” 1992)

- Convinced that humanity must be guided by a moral code of action to respect the inherent worth of nature, and in fulfillment of commitments made in the World Charter of Nature, we shall be committed to the following:

“...every form of life is unique, warranting respect regardless of its worth to [humans], and to accord other organisms such recognition [humans] must be guided by a moral code of action.” (a, World Charter of Nature, 1982)

- Concurring with the global commitment under the "Convention for the Protection of Cultural and Natural Heritage" (1972) to fulfil our international duty to identify and protect natural heritage for future generations:

“Each State Party to this convention recognizes that the duty of ensuring the identifications, protection, conservation, presentation and transmission to future generations of the cultural and natural heritage...” (Convention for the Protection of the World Cultural and Natural heritage)

- Concurring with the global commitment under the World Charter of Nature (1982) to avoid activities which are likely to cause irreversible damage to nature

**“Activities which are likely to cause irreversible damage to nature shall be avoided; and activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponent shall demonstrate that expected benefits outweigh potential damage to nature, and where potential aversive effects are not fully understood, the activities should not proceed” (Agenda 21, section 11b)**

- **Concurring with the enshrinement of the precautionary principle and in fulfillment of commitments made in the Rio Declaration and in Agenda 21, we shall be committed to the following:**

**" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).**

- **Recognizing that causes of irreversible environmental damage may not be fully understood or predictable, and in fulfillment of commitments made in Agenda 21, we shall recognize the following:**

**"In the face of threats of irreversible environmental damage, lack of full scientific understanding should not be an excuse for postponing actions which are justified in their own right. The precautionary approach could provide a basis for policies relating to complex systems that are not yet fully understood and whose consequences of disturbances cannot yet be predicted” (Agenda 21, 35.4)**

- **Concurring with the enshrinement of the principle of prior environmental impact assessment and in fulfillment of commitments made in Agenda 21, we shall enshrine the following principle:**

**"Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences" 7.42 b  
" Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment; (17.23 b Marine)**

- **Concurring with the global condemnation of the transfer or relocation of harmful activities or substances, and in fulfillment of our commitments made in the Rio Declaration, we shall condemn the following:**

**the transfer and relocation to other states of any activities and substances that cause severe environmental degradation or are found to be harmful to human health."(Principle 14 Rio Declaration)**

- **Concurring with the need to examine the "cradle to grave," or "full life cycle" approach to industry, and in fulfillment of our commitments made in Agenda 21, we will require and undertake the complete analysis of each industry's intervention into the ecosystem**

**“...should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits” (Agenda 21 20.20 e)**

## THE PROVINCIAL COMMITMENT

The government of British Columbia is committed to:

- **preserving significant representative ecosystems**, protecting and restoring the quality and integrity of the environment, and
- **ensuring *securing ecologically safe and sound employment securing a sound and prosperous economy***

This commitment is made to the people of British Columbia and to the global community. A healthy environment and **ecologically safe and sound employment healthy economy. are essential British Columbia. to the social, cultural, material, physical and spiritual well-being of British Columbians.** Furthermore, the Province recognizes its obligations **under various international declarations, conventions and charters, to preserve representative ecosystems, and to protect, and manage and use its resources and environment to fulfill its responsibility to global well-being. in an ecologically safe and sound way its land, air and water resources.** Finally, the Province shall ensure that present-day decisions do not compromise **the integrity and inherent worth of preserved ecosystems** and the ability of future generations to meet their own environmental and economic needs.

- **recognizing the current change in global political situation, the province will make a request to the Federal Government to transfer a substantial segment of the military budget to be used for the preservation of significant areas of land and water bodies, for allowing for the regeneration of areas that have been destroyed, for providing for the restoration of areas that have suffered environmental degradation, and for the creation of ecologically safe and sound employment through value added jobs**

- **recognizing that human understanding of nature is incomplete the province will undertake to preserve significant ecosystems**

- **recognizing that injunctions are usually granted to prevent irreparable harm, the issuing of injunction against those who are attempting to prevent irreversible harm is untenable**

PRINCIPLES  
*Sustainable Environment*

**[the preserving of ecosystems, the engaging in ecologically safe and sound practices and the entrenching of social programs are not separated here]**

*A healthy environment is the foundation upon which a sound economy and society depend. [Ecosystems do not only have a role to support society]. The essential role that ecosystems play in supporting our society establishes an environmental imperative that must be respected in all land, resource and economic decisions. Our priority must be to maintain natural systems for present and future generations.*

**1. To redress the imbalance resulting from years of non-compliance to the spirit of international Conventions such as the Convention for the Protection and Preservation of Cultural and Natural heritage, and Charters such the World Charter of Nature (1972), the Province shall immediately preserve the little remaining significant unfragmented old growth areas for ecological heritage and for the maintenance of natural systems.**

The Province shall preserve, maintain and enhance the life-supporting capacity of air, water, land and ecosystems. The Province shall respect **and preserve** the integrity of **intact** natural systems and **will allow for regeneration** will seek to restore previously degraded environments. **The Province will concurrently transfer funds into the creation of ecologically safe and sound employment.**

**to redress the imbalance resulting from years of addressing the errors of previously ecologically unsound practices, the province shall support and fund research not into technological fixes for rectifying the harm caused by ecologically unsafe and unsound practices, but into new and viable ecologically safe and sound practices.**

**to redress the imbalance resulting from years of non-arm's length research reflecting conflict of interest, the province shall support independent non vested interest, arm's length research.**

**to redress the imbalance resulting from the misplaced onus of proof, the province shall shift the burden of proof from those opposing the intervention having to demonstrate harm to those proposing the intervention having to demonstrate the ecological safety and soundness of the intervention**

**2. The Province shall preserve significant areas that contain biodiversity and shall conserve biological diversity in genes, species and ecosystem and**

**shall condemn, ban disallow any practices that contribute to loss of biodiversity. including current practices of clear-cut logging. The province will not permit the redefining of the term Biodiversity to accommodate ecologically unsound practices such as clear-cut logging.**

3. The province shall *attempt to* anticipate and prevent adverse environmental impacts. When making land and resource decisions, the province shall exercise caution and special concern for natural values, recognizing that human understanding of nature is incomplete.

4. "The Province shall ensure that the **true** environmental and social costs are accounted for **prior to making a decision for a project or an activity that will affect air, water or land.** *in land resource use and economic to proceed the true environmental social costs will have to consider the costs required by society not only to repair the harm but also to do research into repairing the harm, and to monitor ecologically unsound practices and to enforce regulations and in assessing the true environmental costs those who have been responsible will be required to pay for past as well as present damage"* (polluter pay principle as enunciated in Agenda 21)

3. The province shall also establish high provincial standards for ecologically safe and sound practices and products taking into consideration fundamental international principles of preservation and ecologically safe and sound employment.

The province shall establish a series of independent panels reflecting community concern, not vested interests to attempt to establish province wide guidelines for ecologically safe and sound practices

The province shall establish a list of industries or industrial practices that have not been able to satisfy the ecologically safe and sound conditions of the life cycle approach and disallow these industries to function in the province

The province shall subject all interventions that could have a potential adverse effect to environmental assessment review

The province will disallow any practice that has been deemed ecologically unsound by a panel of independent, non vested concerned body

5. The province shall recognize its responsibility **to preserve significant representative ecosystems**, to protect, and restore the global environment

the province shall reduce consumption to sustainable levels, **engage in alternative practices that reduce consumption**, and avoid importing or exporting ecological *stresses activities or substances that could cause harm to human health or to the environment* [statement in harmony with

**wording in the Rio Declaration]** and to help meet the global challenge of sustainably supporting the human population

**the province shall establish ecologically safe and sound working environments for all employees. No employee shall ever be dismissed from work for demanding to have ecologically safe and sound environment**

**The province shall not be required to pay compensation for the transferring of resource use into non-use or preservation reverting to the ecological commons.**

**the province shall undertake to assist with funds transferred from the military budget to convert ecologically unsound employment to ecologically safe and sound employment.**

6. the Province shall preserve and protect the environment for its inherent value and for the use and enjoyment of humans

*Sustainable Economy*

**[ preservation of ecosystems, and then the engaging in ecologically safe and sound practices and the entrenchment of strong social programs are not separated here}**

**The province shall recognize that the preservation of significant areas is a global requirement and is conditional not on economic development but on political will. Similarly, the willingness to ensure ecologically safe and sound employment in an ecologically safe and sound environment is all dependent on political will. The establishment of the commitment to preservation and to ecologically safe and sound employment will drive the community to fulfill these requirements.**

**Given the urgency of the current global situation, the province undertakes to ensure that employment shall be ecologically safe and sound.**

**The Province shall ensure that ecologically sound practices prevail, and will fund only appropriate technology beyond simply allowing for the prevailing of currently unsound practices.**

**The province shall ensure that ecologically unsound practices will be phased out and eventually eliminated**

**the province shall recognize that it is impossible to balance two values when the fulfillment of one is the denial of the other.**

1. The Province shall promote a dynamic and competitive **ecologically safe and sound** economy that maintains options for **land air and water**

**preservation and ecologically safe and sound use** future land and resources uses.

**The Province shall advocate international ecologically safe and sound standards so that the province in advocating the highest tenable standards will not be at a global disadvantage**

**The Province shall make a representation to GATT to insist that high international standards be established for preservation of nature, conservation of resources, and ecologically safe and sound practices so that no action in the Province taken to address the need for ecologically safe and sound employment will be overturned as being a subsidy. For example, the decision by the province to stop the export of raw logs (as per section 135 in the Forest Act) so as to create ecologically sound employment shall not be construed as a subsidy.**

2. the Province shall encourage diversified economic development **in an ecologically safe and sound way that** increases the employment and other benefits derived from a given stock of resources.

3. The Province shall *encourage* **insist that pollution is controlled at the source and that there will be eventually zero harmful emissions into the ecosystem encourage, and shall insist on proposal for development that make ecologically safe and sound and efficient use of resources**  
*development that reduces waste and makes efficient use of resources*

4. *The Province shall encourage optimum use of natural systems and resources, consistent with their inherent capability to support our economic, social and environmental needs.* **{vacuous statement unclear what that would entail}**

5. “The province shall ensure that renewable resources are used in an **ecologically safe and sound** manner **so** that they will be sustainable over the long term. **and the Province will not jeopardize long term ecological rights to natural heritage and to ecologically safe and sound employment for short-term economic gain**

6. The Province shall ensure that the use of non-renewable resources **is phased out and that funding be placed immediately into discovering ecologically safe and sound alternatives” (Agenda 21, Energy section)** avoids **avoiding** their exhaustion and addresses the needs of future generations

7. *The Province shall stimulate environmentally sound economic activity and innovation through a system of economic instruments* **[ environmental sound economic activity should not be introduced only in this section it should be a precondition for all future activity. By having it in this section it suggests that the reference to economic activity in other sections does not mean environmentally sound]**

8. the Province shall provide a regulatory framework which promotes stability and predictability for business and investment. **The Province, through the**

**development of standards of ecologically safe and sound practices will minimize the need to monitor as the engaging in ecologically safe and sound practices will entail a different type of monitoring; a monitoring to determine if industry is engaging in these practices rather than a monitoring to determine whether the practices are having a significant adverse impact on the environment.**

#### *Social Sustainability*

**[ preservation of ecosystems, and then the engaging in ecologically safe and sound practices, and the entrenchment of strong social programs are not separated here}**

Social equity requires that the concerns of individuals and communities are respected **as ecological preservation and ecologically safe and sound employment are established.** *environmental and economic needs are balanced.*

1 The Province shall aim for a fair distribution of the costs and benefits of *land use decisions about land, air and water.* **and undertake to propose measures that will bring about a more equitable distribution of resources. This could entail the giving of a guaranteed annual income to anyone who is displaced as a result of conversion to ecologically sound employment, and ensure that the person will be appropriately retrained. In this way those whose jobs have been converted will not be required to move from the community.**

2. The Province is committed to social stability, and will support economic and social measures to address the economic effects of land use decisions  
**These measures could entail the giving of a guaranteed annual income to anyone who is displaced as a result of conversion to ecologically sound employment, and ensure that the person will be appropriately retrained. In this way those whose jobs have been converted will not be required to move from the community.**

3. The Province shall promote a good quality of life by fostering opportunities to;

\* **earn a living in an ecologically safe and sound way**

\***obtain education and training by putting additional funding into the creation of post-secondary institutions**

\* **access social, cultural and recreation services and**

\* **enjoy a quality environment though the preservation of significant ecosystem, the creation of ecologically safe and sound employment, and the entrenching of social equity programs**

4. In addition, equity requires that land use and related resources and environmental decisions be made in a fair and open manner **without the participation of those who have a vested economic interest in not adhering to ecologically safe and sound practices**

**REXAMINATION OF THE TERMS OF REFERENCE OF CORE AND THE "LAND USE CHARTER" IN THE LIGHT OF THE TWO FOLLOWING EXTENUATING CIRCUMSTANCES;**

**1. THE REQUESTED INVESTIGATION BY THE OMBUDSMAN'S OFFICE INTO THE ENVIRONMENTAL DEGRADATION CAUSED BY THE MINISTRY OF FOREST'S NON-COMPLIANCE WITH THE FOREST ACT SECTION 60. OF INTERNATIONAL AGREEMENTS.**

In September 1991, we submitted a complaint the Ombudsman office, while Steven Owen was still the ombudsman, calling for the investigation into forest practices that were causing damage to the natural environment to support the claim we submitted a document from the Ministry of Fisheries indicating the destruction of fish habitat (a violation of section 33 of the Fisheries Act, caused by current logging practices We were notified that the complaint would be addressed.

While Steven Owen was the ombudsman little was done to investigate this complaint.

In January 1992, CORE was established, and Stephen Owen was named as the Commissioner,

in June forestry Minister, Miller, suddenly became cognizant of the degradation that had occurred through logging practices.

One of the implications of this complaint is that if the complaint is deemed justified, and if the Ministry of Forests, and industry through noncompliance with the Forest Act caused damage to the natural environment, the whole discussion of 'compensation" for areas that will be taken out of TFL and put into wilderness areas will be reassessed.

**2. THE COMMITMENTS BY CANADA TO PRINCIPLES ENUNCIATED IN INTERNATIONAL AGREEMENTS.**

...practices. and calling for the enforcing of section 60 of the Forest Act was initiated prior to the completion by the Ombudsman's office  
CORE was initiated at a time prior to the deliberations of UNCED. As a result of many of the deliberations of UNCED, a few key principles emerged that need to reassess the terms of reference of CORE

Given the recognition of the urgency of the global situation  
" Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage

Conventions, as appropriate, conservation of genetic resources, involving in situ and ex situ measures and undertaking supportive measures to ensure sustainable utilization of biological resources and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities;" (11.15 b., Deforestation)

"Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems."

(18.45 Fresh water)

"There are few regions of the world that are still exempt from the problems of loss of potential sources of freshwater supply, degraded water quality and pollution of surface and groundwater sources. Major problems affecting the water quality of rivers and lakes arise, in variable order of importance according to different situations, from inadequately treated domestic sewage, inadequate controls on the discharges of industrial waste waters, loss and destruction of catchment areas, ill-considered siting of agricultural practices. This gives rise to the leaching of nutrients and pesticides. Aquatic ecosystems are disturbed and living freshwater resources are threatened. ...Erosion, degradation, deforestation and desertification have led to increased land degradation, and the creation of reservoirs has, in some cases, resulted in adverse effects on ecosystems. Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems. A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies." (18.45 Fresh water)

" to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity "(4.7.a Changing Consumption Patterns)

Decision making process

a distinction must be made between vested interests and public concern

• 1992 Initiated and distributed a Report card on Canada's failure, through practices in British Columbia, to comply with the Biodiversity Convention

Have been extracting underlying principles and processes, formulating concepts and discerning patterns from different disciplines as a means of better understanding each discipline; and as a means of integrating different disciplines, and establishing a framework for interdisciplinary thought

( ) I was invited to participate in a meeting with a speaker from the Federal government who gave what he determined was the legal background for first Nations rights. I pointed out a significant omission which was the court case in 1988 *McMillan vs Mullin* Michael Mullin Friends of Clayoquot. In this case, the court decided that the ecological rights of the First Nations would be jeopardized if *McMillan Bloedel* would be granted an injunction.

In *MacMillan Bloedel vs Mullin* it was decided that an injunction would not be granted because granting an injunction could deprive the native community of their "ecological rights" in the case of pending land title, and that *MacMillan Bloedel* would not suffer "irreparable harm"

the claim by an Indian band for 'aboriginal " title to land cannot be 'rejected summarily' and certainly not at the early stages of litigation. Nor must the right to log crown land given by licence to a logging Company be ignored. However in light of the fact that **unless the issue of title to the subject land is settled before logging occurs the Indians, if successful, will be deprived of valuable ecological rights, and in further light of the fact that irreparable harm will not result to the logging Company if timber harvest is delayed pending an expedited adjudication of issue of title, the principles applicable to the issue of interlocutory injunctions will militate that the status quo. be maintained.**

We believe that because Canada has made these commitments, and because these commitments are inconsistent with the continuing to log in significant stands of unfragmented watersheds that the injunction should be rescinded because the injunction is contributing the non-fulfillment of international, national and provincial obligations.

( ) THAT in 1992, I prepared A Report Card on the BC government's failure to comply with the Convention on Biological Diversity for the International Law and Obligations Institute (project) and presented this report to various Ministries on the coming into force of the Convention on Biological Diversity

( ) THAT, in November, 1992 I Attended VINE steering committee meeting in Strathcona.

#### **COMMENT**

Vicky Husband Conservation chair of the Sierra Club of Western Canada and ... from the Canada wilderness committee had worked on a revamping The participation of sectors at the CORE table required a Statement of interest. I read through the "Statement of Interest" coming from the Conservation sector I found that what had become their "wish list" was in fact a statement of what the government was obliged or committed to do through international agreements or through Federal or provincial Acts or statutes. I spoke with Steven Owen, the chair of CORE about the necessity of having CORE a principle based decision-making

process rather than an arena of competing interests. I pointed out to him that most of what the Conservation sector was asking for in their interest statement was already an obligation or a commitment. He showed little interest and I believe cited the notorious 1937 Labour Convention case. [At that time I was not aware that the BC cabinet had endorsed the Convention on biological Diversity and the Framework Convention on Climate Change at the cabinet level: something I had found out later through obtaining cabinet documents from freedom of information ]  
At the meeting, when I heard that activists were being arrested in the forests, I stepped down from the CORE PROCESS, and wrote for VINE, A PIECE ON "Who are the real criminals"

## EXHIBIT

( ) THAT in 1992 in December I wrote  
ARRESTS IN B.C. FORESTS: WHO ARE THE REAL CRIMINALS?

Since 1948, Canada has made significant international commitments to human rights, equity, social justice, ecological preservation, and ecologically sound practices, (Universal Declaration of Human Rights , 1948; International Covenant of Social, Cultural Rights; Environmental Conference in Stockholm, 1972; UN Conservation of Natural Heritage, 1972; the World Charter of Nature, 1982; Global Biodiversity Strategy, 1992; the Caracas Declaration 1992; Biodiversity Convention, Climate Change Convention and Agenda 21, 1992 ) The action to condemn and in some cases imprison individuals who call for Canada's compliance to these international, national and provincial commitments has been in direct violation of principles of equity, social justice and human rights.

For years, through its forest practices, Canada as well as the forest Industry has been in violation of international law., and even in violation of its own federal and provincial law. Through non-compliance with its international commitments, and with national and provincial Acts , the government has permitted devastation of its forests; this devastation is now recognized widely and condemned by the international community

The practice of clear-cutting, followed by [broadcast burn] artificial reforestation has undoubtedly many technical and organizational advantages. In the course of time, however, soil scientists and ecologists found out that the practice of clear-cutting automatically leads to considerable drawbacks:

- wounding of the soil surface through logging operations. risk of erosion
- high irradiation and higher climatic extremes alter the microclimate, the flora and the microflora and deteriorate the growing conditions for a number of valuable tree species. Soil compression and a reduction of species richness occur
- An accelerated decomposition of organic matter occurs, combined with a wash out of nutrients, and the eutrophication of ground water, rivers and lakes ( Dr Schutt, Biological

Department, University of Munich, Environmental Ethics  
Conference, 1992, Vancouver)

Section 60 of the Forest Act calls for suspension of tree farm licensees if industry, through non-compliance to the Forest Act, has caused harm to the natural environment. Throughout B.C. environmentalists have been documenting evidence of non-compliance to the Forest Act. The Fisheries Department has documented evidence of violation by the forest industry of section 33 of the Fisheries Act. The Forest Act has not been enforced because most of the sections in the act are discretionary. One of the only recourses for environmentalists has been to call upon the Ombudsman to investigate whether government has fairly complied with its own legislation. In September of 1991, a complaint was filed with the Ombudsman's office to investigate whether government's has fairly complied with the Forest Act. This complaint has only now begun to be seriously investigated. The Ombudsman's office has not, however, been given the mandate to investigate whether or not the government of Canada is fairly complying with its international commitments.

The protesters, like the government and industry have not complied with the law. Governments and industry in Canada continue to violate international agreements, ignore the enforcement of federal and provincial Acts, and allow irreparable harm to the environment. Over 200 Vancouver Island protesters from environmental groups and from the Native community have been arrested, condemned as criminals and in some cases imprisoned because they call for compliance to commitments, attempt to prevent irreparable harm, and demand that environmental law be enforced in a less discretionary manner.

In the latest case, the protesters in Clayoquot Sound have been condemned as criminals because of their non-compliance with an injunction to prevent them from preventing irreparable harm. On the other hand McMillan Bloedel has been fined in Clayoquot Sound for causing irreparable harm. Traditionally, the equitable remedy of injunctions is deemed necessary to prevent irreparable harm. In 1985, the court concurred with this conception in McMillan Bloedel vs. Mullin where it was decided that

Indians, ...will be deprived of valuable ecological rights, and in further light of the fact that irreparable harm will not result to the Logging Company if timber harvest is delayed pending an expedited adjudication of issue [1985, BCD Civ 1892-08]

Now, the courts have appeared to misconstrue the concept of irreparable harm: those who cause irreparable harm ( industry) through non-compliance with international, national and provincial commitments are granted injunctions to facilitate their continuing to cause irreparable harm , while those, ( environmentalist and native leaders) are condemned as criminals for not complying with the injunctions granted to facilitate irreparable harm. The most that has happened to industry when it has been found in fault is a fine not criminal condemnation; thus, the causing of irreparable damage is deemed to be compensable through fines, whereas attempting to prevent irreparable

damage by ignoring an injunction is deemed to be rectified through criminal proceedings.

If governments do not comply with their commitments, if the courts misconstrue equitable law, and if the ombudsman has a limited scope of jurisdiction, where can the public turn for justice?

Copies of this letter was sent on Tuesday December 23, 1992, to the Vancouver Sun, the Globe and Mail, Web international network, and to UNEP (United Nations Environmental Programme)

Since 1972, Canada has made significant international commitments to human rights, equity, social justice. ecological preservation, and ecologically sound practices, (Universal Declaration of Human Rights , 1948; International Covenant of Social, Cultural Rights; Environmental Conference in Stockholm, 1972; UN Conservation of Natural Heritage, 1972; the World Charter of Nature, 1982; Global Biodiversity Strategy, 1992; the Caracas Declaration 1992; Biodiversity Convention, Climate Change Convention and Agenda 21, 1992). The action to condemn and in some cases imprison individuals who call for Canada's compliance to these international, national and provincial commitments has been in direct violation of principles of equity, social justice and human rights.

For years, through its forest practices, Canada as well as the forest Industry has been in, and even in violation of its own federal and provincial law. Through non-compliance with its international commitments, and with national and provincial Acts , the government has permitted devastation of its forests; this devastation is now recognized widely and condemned by the international community

“The practice of clear-cutting, followed by [broadcast burn] artificial reforestation has undoubtedly many technical and organizational advantages. In the course of time, however, soil scientists and ecologists found out that the practice of clear-cutting automatically leads to considerable drawbacks:

- wounding of the soil surface through logging operations. risk of erosion
- high irradiation and higher climatic extremes alter the microclimate, the flora and the microflora and deteriorate the growing conditions for a number of valuable tree species. Soil compression and a reduction of species richness occur
- An accelerated decomposition of organic matter occurs, combined with a wash out of nutrients, and the eutrophication of ground water, rivers and lakes” ( Dr Schutt, Biological

Department, University of Munich, Environmental Ethics  
Conference, 1992, Vancouver)

Section 60 of the Forest Act calls for suspension of tree farm licenses if the licence holder has caused harm to the natural environment. Throughout B.C. environmentalists have been documenting evidence of non-compliance with the Forest Act. The Fisheries Department has documented evidence of violation by the forest industry of section 33 of the Fisheries Act. The Forest Act has not been enforced because most of the sections in the act are discretionary.

The protesters, like the government and industry have not complied with the law. Governments and industry in Canada continue to violate international agreements, ignore the enforcement of federal and provincial Acts, and allow irreparable harm to befall the environment. Over 200 Vancouver Island protesters from environmental groups and from the Native community have been arrested, condemned as criminals and in some cases imprisoned because they call for compliance with commitments, attempt to prevent irreparable harm, and demand that environmental law be enforced in a less discretionary manner.

In the latest case, the protesters in Clayoquot Sound have been condemned as criminals because of their non-compliance with an injunction to prevent them from preventing irreparable harm. On the other hand McMillan Bloedel has been fined in Clayoquot Sound for causing irreparable harm. Traditionally, the equitable remedy of injunctions is deemed necessary to prevent irreparable harm. In 1985, the court concurred with this conception in *McMillan Bloedel vs. Mullin* where it was decided that

“Indians, ...will be deprived of valuable ecological rights, and in further light of the fact that irreparable harm will not result to the Logging Company if timber harvest is delayed pending an expedited adjudication of issue” [1985, BCD Civ 1892-08]

Now, the courts have appeared to misconstrue the concept of irreparable harm: those who cause irreparable harm (industry) through non-compliance with international, national and provincial commitments are granted injunctions to facilitate their continuing to cause irreparable harm, while those (environmentalist and native leaders) are condemned as criminals for not complying with the injunctions granted to facilitate irreparable harm. The most that has happened to industry when it has been found in fault is a fine not criminal condemnation; thus, the causing of irreparable damage is deemed to be compensable through fines, whereas attempting to prevent irreparable damage by ignoring an injunction is deemed to be rectified through criminal proceedings.

If governments do not comply with their commitments, and if the courts misconstrue equitable law, where can the public turn for justice?

Often intact ecosystems that have been deserving of preservation have been irreversibly destroyed because it was deemed necessary, if these ecosystems were to be withdrawn from an existing tree farm licence, for governments to pay compensation. In the past,

compensation has been assessed purely from an economic basis without taking into consideration the true environmental costs. In order to assess the environmental costs of the destruction of significant ecosystems one may need to examine if damage to the natural environment within a significant ecosystem has occurred. Section 60 of the Forest Act does permit the suspension of licensees if environmental damage to the natural environment has occurred. The potential environmental costs of destroying significant ecosystems as a result of the Ministry of Forests not suspending tree farm licensees when there was evidence of destruction to the natural environment is necessary to include in the assessment of compensation. Although, often the companies that have contributed in the past to the destruction of significant ecosystems may not be the current holders of the specific tree farm licence in the area containing the significant ecosystem, most of the companies are still functioning in British Columbia. This investigation of the environmental costs would involve the whole province so that there would need to be a global assessment of environmental costs incurred by the companies, not a valley to valley assessment.

Canada violates or ignores international environmental documents to which it has been a signatory while deluding the world community into thinking that it is genuinely concerned about the environment.

At the press conference given by Federal Minister of the Environment, Jean Charest at the UNCED conference in Rio, a representative of the United Nations introduced Charest as being from a country which was truly concerned about the environment. During the question period I indicated that " UNCED should be a time to dispel myths not perpetuate them and that Canada is not an ecologically sound country and that we should be honest with the rest of the world

Evidence that could dispel the myth that Canada is truly concerned about the environment has been occurring for years throughout B.C. in the forest industry, and is occurring currently in the dispute in Clayoquot Sound.

Rather than the courts in Canada insisting on adherence to international environmental documents such as the World Charter of Nature ( UN Resolution 37/7, 1982) or to the current Convention on Biological Diversity ( 1992), Canadian courts condemn those who strive to call for the adherence to international law (environmentalists) , and condone those who ignore International Law. (industry).

For Example, Canada is a signatory of the World Charter of Nature, 1982 (UN resolution 37/7) which states the following:

11. Activities which might have an impact on nature shall be controlled, and the best available technologies that minimize significant risks to nature or other adverse effects shall be used; in particular;
  - a) all activities which are likely to cause irreversible damage to nature shall be avoided;

c) Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed;

Have governments in Canada since 1982 "avoided" industrial activities such as ecologically unsound logging practices that have caused irreversible damage to nature.? Have governments in Canada called upon forest companies to not proceed with ecologically unsound practices whose adverse effects are not fully understood?

In 1992, Canada is now a signatory of the Convention on Biological Diversity which notes the following:

that it is vital to anticipate, prevent and attack the causes of significant reduction or loss of biological diversity at source.

Also where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat.

Is Canada reducing the loss of biological diversity at the source, when it is prepared to log old growth forests before it has carried out adequate non-arms length research into the true biodiversity of the old growth forests? Is there not strong enough evidence in place that clear-cut logging has destroyed biodiversity, yet we appear to wait for "scientific certainty" before we are prepared to avoid or minimize such a threat? By that time there may be very little biodiversity left.

At the Press Conference where Mulroney signed the Convention on Biological Diversity in Rio de Janeiro, I asked him " if the signing of this document would mean that the government of Canada would condemn ecologically unsound practices such as clear-cut logging that destroy biodiversity." He replied that "he did not want to deal with issues "

If Mulroney is willing to sign a document professing to adhere to the preservation of biodiversity, and if he is not willing to deal with the practices that contribute to the loss of biodiversity, then the Canadian public will have to bring this discrepancy between rhetoric and action to the attention of the international community...

The environmentalists who have continually been striving to preserve the little remaining old growth forests, and to call for the need to identify and do research into biodiversity are the ones who have been adhering to the principles `1992 Nations Convention on Biological Diversity. Yet it is those

who act to prevent "irreversibility" that are prosecuted as criminals, and those who cause "irreversibility" that are protected by Canadian courts

( ) THAT in 1992 December, I Prepared for the International Law and Obligations Institute (project), a Report Card on the BC governments compliance with the Convention on Biological Diversity on the coming into force of the Convention on Biological Diversity

### ARRESTS IN B.C. FORESTS: WHO ARE THE REAL CRIMINALS?

Since 1972, Canada has made significant international commitments to human rights, equity, and social justice. ecological preservation, and ecologically sound practices, (Universal Declaration of Human Rights , 1948; International Covenant of Social, Cultural Rights; Environmental Conference in Stockholm, 1972; UN Conservation of Natural Heritage, 1972; the World Charter of Nature, 1982; Global Biodiversity Strategy, 1992; the Caracas Declaration 1992; Biodiversity Convention, Climate Change Convention and Agenda 21, 1992 ) The action to condemn and in some cases imprison individuals who call for Canada's compliance to these international, national and provincial commitments has been in direct violation of principles of equity, social justice and human rights.

For years, through its forest practices, Canada as well as the forest Industry has been in violation of international law., and even in violation of its own federal and provincial law. Through non-compliance with its international commitments, and with national and provincial Acts, the government has permitted devastation of its forests; this devastation is now recognized widely and condemned by the international community.

The practice of clearcutting, followed by [broadcast burn] artificial reforestation has undoubtedly many technical and organizational advantages. In the course of time, however, soil scientists and ecologists found out that the practice of clearcutting automatically leads to considerable drawbacks:

- wounding of the soil surface through logging operations. risk of erosion
- high irradiation and higher climatic extremes alter the microclimate, the flora and the microflora and deteriorate the growing conditions for a number of valuable tree species. Soil compression and a reduction of species richness occur
- An accelerated decomposition of organic matter occurs, combined with a wash out of nutrients, and the eutrophication of ground water, rivers and lakes (Dr Schutt, Biological Department, University of Munich, Environmental Ethics Conference, 1992, Vancouver)

Section 60 of the Forest Act calls for suspension of tree farm licensees if industry, through non-compliance to the Forest Act, has caused harm to the natural environment. Throughout B.C. environmentalists have been

documenting evidence of non-compliance to the Forest Act. The Fisheries Department has documented evidence of violation by the forest industry of section 33 of the Fisheries Act. The Forest Act has not been enforced because most of the sections in the act are discretionary. One of the only recourses for environmentalists has been to call upon the Ombudsman to investigate whether government has fairly complied with its own legislation. In September of 1991, a complaint was filed with the Ombudsman's office to investigate whether governments have fairly complied with the Forest Act. This complaint has only now begun to be seriously investigated. The Ombudsman's office has not, however, been given the mandate to investigate whether or not the government of Canada is fairly complying with its international commitments.

Government and industry have not complied with the law. Governments and industry in Canada continue to violate international agreements, ignore the enforcement of federal and provincial Acts, and allow irreparable harm to befall the environment. Over 200 Vancouver Island protesters from environmental groups and from the Native community have been arrested, condemned as criminals and in some cases imprisoned because they call for compliance to commitments, attempt to prevent irreparable harm, and demand that environmental law be enforced in a less discretionary manner.

In the latest case, the protesters in Clayoquot Sound have been condemned as criminals because of their non-compliance with an injunction to prevent them from preventing irreparable harm. On the other hand, McMillan Bloedel has been fined in Clayoquot Sound for causing irreparable harm. Traditionally, the equitable remedy of injunctions is deemed necessary to prevent irreparable harm. In 1985, the court concurred with this conception in *McMillan Bloedel vs. Mullin* where it was decided that

Indians, ...will be deprived of valuable ecological rights, and in further light of the fact that irreparable harm will not result to the Logging Company if timber harvest is delayed pending an expedited adjudication of issue [1985, BCD Civ 1892-08]

Now, the courts have appeared to misconstrue the concept of irreparable harm: those who cause irreparable harm (industry) through non-compliance with international, national and provincial commitments are granted injunctions to facilitate their continuing to cause irreparable harm, while those, (environmentalist and native leaders) are condemned as criminals for not complying with the injunctions granted to facilitate irreparable harm. The most that has happened to industry when it has been found in fault is a fine not criminal condemnation; thus, the causing of irreparable damage is deemed to be compensable through fines, whereas attempting to prevent irreparable damage by ignoring an injunction is deemed to be rectified through criminal proceedings.

If governments do not comply with their commitments, if the courts misconstrue equitable law, and if the ombudsman has a limited scope of jurisdiction, where can the public turn for justice?

( ) THAT in February 1993, I went as a delegate to a meeting of EECOM in Merrickville near Ottawa of the compromising group that came out of ECO-ED  
COMMENT

At ECO-ED, when I attended a working group with environmental educators, I introduced myself and indicated my concern about industry's intrusion into education and the misinterpretation of Chapter 36 from Agenda 21; Then the others introduced themselves and most of them were associated with industry- forests and petroleum. Out of this meeting, the network EECOM of "environmental educators" was formed. I went to the meeting to try to change the direction of EECOM away from corporate influence. They continued to misinterpret Chapter 36, and I left the group.

( ) THAT in 1993, in Ottawa, I went into the building where the IDRC office was and asked the concierge which floor the IDRC was on and I was stunned, when he said the whole building. I asked for the section on biodiversity and met with the researchers in the section. I asked them what was going to be done about Canada's non-compliance with the Convention on Biological Diversity; I was told that they were only going to be addressing compliance with the Convention of Biodiversity in developing countries.

( ) THAT in 1993 in Ottawa, I went to a meeting with Federal Forest minister, Jag Maini in Ottawa, and passed on to him our composite document on the forest principles

EXHIBIT

**RE-EXAMINATION OF "FOREST PRINCIPLES" DOCUMENT ("NON-LEGALLY BINDING AUTHORITATIVE STATEMENT OF PRINCIPLES FOR A GLOBAL CONSENSUS ON THE MANAGEMENT, CONSERVATION, AND SUSTAINABLE DEVELOPMENT OF ALL TYPES OF FORESTS") IN THE LIGHT OF COMMITMENTS MADE IN AGENDA 21, RIO DECLARATION, BIODIVERSITY CONVENTION, CLIMATE CHANGE CONVENTION AND OTHER INTERNATIONAL DOCUMENTS; AS WELL AS IN THE LIGHT OF RECOMMENDATIONS MADE BY ERA**

DEFORESTATION" DOCUMENT WITH RELEVANT SECTIONS IN  
AGENDA 21 (1992), IN THE RIO DECLARATION (1992), THE  
BIODIVERSITY CONVENTION, THE CLIMATE CHANGE CONVENTION,  
THE WORLD CHARTER OF NATURE (1982), AND THE PRESERVATION  
OF CULTURAL AND NATURAL HERITAGE (1972). TO HARMONIZE WITH  
AGENDA 21, THE "LAND RESOURCES; DEFORESTATION" DOCUMENT  
MUST ADDRESS THE FOLLOWING SECTIONS ADOPTED BY THE**

## GLOBAL COMMUNITY THROUGH AGENDA 21, AND THE RIO DECLARATION:

- THREAT OF UNCONTROLLED DEGRADATION
- THREAT OF CONVERSION TO OTHER TYPES OF USE
- HARMFUL MISMANAGEMENT SUCH AS UNSUSTAINABLE COMMERCIAL LOGGING

"Forests world-wide have been and are being threatened by uncontrolled degradation and conversion to other types of land uses, influenced by increasing human needs; agricultural expansion, and environmentally harmful mismanagement, including, for example, lack of adequate forest-fire control and anti-poaching measures, unsustainable commercial logging, overgrazing and ... the impacts of loss and degradation of forests are in the form of soil erosion; loss of biological diversity, damage to wildlife habitats and degradation of watershed areas, deterioration of the quality of life and reduction of the options for development. (Agenda 21, 11.12. Deforestation)

- ECOLOGICAL DETERIORATION OF WATERSHEDS
- EXCESSIVE DEFORESTATION

"There are serious problems of ecological deterioration in these watershed areas. ... In many areas this is accompanied by excessive livestock grazing, deforestation and loss of biomass cover. (Agenda 21 -13.13 Fragile ecosystems)

- INAPPROPRIATE AND UNCONTROLLED LAND USE

" Inappropriate and uncontrolled land uses are a major cause of degradation and depletion of land resources. Present land use often disregards the actual potentials, carrying capacities and limitations of land resources as well as their diversity in space. (Agenda 21 - 14.34 Agriculture)

- LOSS OF BIODIVERSITY FROM OVER-HARVESTING
- LOSS OF BIODIVERSITY FROM HABITAT DESTRUCTION
- LOSS OF BIODIVERSITY FROM POLLUTION

" Despite mounting efforts over the past 20 years, the loss of the world biological diversity, mainly from habitat destruction, over-harvesting, pollution and the inappropriate introduction of foreign plants and animals has continued. (Agenda 21, 15.3 Biodiversity)

- WATER QUALITY AFFECTED BY DEFORESTATION
- WATER QUALITY AFFECTED BY LOSS AND DESTRUCTION OF CATCHMENT AREAS
- LAND DEGRADATION FROM DEFORESTATION
- PROBLEMS ARISE BECAUSE OF DEVELOPMENT MODEL IS ENVIRONMENTALLY DESTRUCTIVE
- INADEQUATE MONITORING
- NEED FOR PREVENTIVE APPROACH

"Major problems affecting the water quality of rivers and lakes arise, in variable order of importance according to different situations, from inadequately treated domestic sewage, inadequate controls on the discharges of industrial waste waters, loss and destruction of catchment areas, ill-considered siting of agricultural practices. This gives rise to the leaching of nutrients and pesticides. Aquatic ecosystems are disturbed and living freshwater resources are threatened. ...Erosion, degradation, deforestation and desertification have led to increased land degradation, and the creation of reservoirs have, in some cases, resulted in adverse effects on ecosystems. Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management, use and treatment of water resources and aquatic ecosystems. A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies. (Agenda 21, 18.45 Fresh water)

- CONSERVATION OF BIODIVERSITY

" Promote cooperation between the parties to relevant international conventions and action plans with the aim of strengthening and coordinating efforts to conserve biological diversity and the sustainable use of biological resources. (Agenda 21, 15.8 e. biodiversity)

" Strengthen support for international and regional instruments, programmes and action plans concerned with the conservation of biological diversity and the sustainable use of biological resources. (15.8 f, Biodiversity)

- NEED TO REORIENT EXISTING PRODUCTION AND CONSUMPTION PATTERNS

"Achieving the goals of environmental quality and sustainable development will require efficiency in production and changes in consumption patterns in order to emphasize optimization of resource use and minimization of waste. In many instances, this will require reorientation of existing production and consumption patterns that have developed in industrial societies and are in turn emulated in much of the world. (4.15 Changing Consumption Patterns, Agenda 21).

- PROMOTION OF PATTERNS OF CONSUMPTION TO MEET BASIC NEEDS

" To promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity (4.7.a Changing Consumption Patterns, Agenda 21)

- PRECAUTIONARY PRINCIPLE

"Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).

Noting also that where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat, (Biodiversity Convention)

- PROVISION FOR NOMINATION OF WORLD HERITAGE SITES FOR OLD GROWTH

"Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage Conventions, as appropriate, conservation of genetic resources, involving in situ and ex situ measures and undertaking supportive measures to ensure sustainable utilization of biological resources and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities; (11.15 b., Deforestation, Agenda 21)

- VALUE OF FORESTS THROUGH NON-DAMAGING USES

It is also possible to increase the value of forests through non-damaging uses such as ecotourism and the *managed* supply of genetic materials. Concerted action is needed in order to increase people's perception of the value of forests and of the benefits they provide. (11.22. Deforestation, Agenda 21)

- VALUE OF ECOTOURISM

"To promote more comprehensive use and economic contribution of forest areas by incorporating eco-tourism into forest management and planning. (11.23 d Deforestation, Agenda 21)

- SUPPORT OF ARMS-LENGTH RESEARCH

Governments and institutions, in collaboration where necessary with appropriate international agencies and organizations, Universities and non-governmental organizations should undertake assessments and systematic observations of forests and related programmes and processes with a view to their continuous improvement. (11.34 Deforestation)

the promotion of sustainable production systems such as traditional methods of agriculture, agroforestry, forestry, range and wildlife *management*, which use, maintain or increase biodiversity (15.5 Biodiversity, Agenda 21)

• PROMOTION OF TRADITIONAL METHODS OF FORESTRY THAT MAINTAIN OR INCREASE BIODIVERSITY

" Take effective economic, social and other appropriate incentive measures to encourage the conservation of biological diversity and the sustainable use of biological *resources*, including the promotion of sustainable production systems, such as traditional methods of agriculture, agroforestry, forestry, range and wildlife *management*, which use, maintain or increase biodiversity (15.5 Biodiversity, Agenda 21)

• LIMITATION OF THE SOVEREIGN RIGHT TO EXPLOIT

States have the sovereign right to exploit their own biological *resources* pursuant to their environmental policies, as well as the responsibility to conserve their biodiversity and use their biological resources sustainably, (15.3 Biodiversity, Agenda 21)

• ENVIRONMENTAL ASSESSMENT OF ALL ACTIVITIES THAT COULD HAVE SIGNIFICANT IMPACTS (INCLUDE FOREST ACTIVITIES)

Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42 Settlement, Agenda 21)

(a) Introduce appropriate procedures requiring environmental impact assessment of its proposed projects that are likely to have significant adverse effects on biological diversity with a view to avoiding or minimizing such effects and, where appropriate, allow for public participation in such procedures; (Biodiversity Convention) From the Climate Change Convention

• RECOGNITION OF THE IMPORTANCE OF FORESTS AS SINKS FOR GREEN HOUSE GASES

Aware of the role and importance in terrestrial and marine ecosystems of sinks and reservoirs of greenhouse gases, Promote sustainable management, and promote and cooperate in the conservation and enhancement, as appropriate, of sinks and reservoirs of all greenhouse gases not controlled by the Montreal Protocol, including biomass, forests and oceans as well as other terrestrial, coastal and marine ecosystems;

(d)

• NEED TO DISCOURAGE OR PREVENT TRANSFER OF ACTIVITIES AND SUBSTANCES THAT CAUSE ENVIRONMENTAL DEGRADATION

"States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health."(Principle 14 Rio Declaration)

## 2. BACKGROUND DISCUSSION RELATED TO A "DECLARATION OF FOREST PRINCIPLES"

**Agenda 21, which was adopted by the global community, was all-inclusive of its examination of "sustainable development," the "Land Resources - Deforestation" document, however, is a narrow sectoral document. Principles related to the inherent worth of forest ecosystem, the sustainability of forest use, and the necessity of international ecologically sound standards must reflect the complexity and all-inclusiveness of many of the enunciated principles in Agenda 21, the Rio declaration as well as the fundamental ecologically sound approach to forests.**

**Given that " We have come to realize that threats to the biosphere, which sustains all life on earth, have changed in rate, magnitude and scale, to such an extent that inaction would be negligent. (Alternate Earth Charter, Global Forum, 1992), we propose the following:**

**Rather than a "Land resources: Deforestation" document which deals with forests in a narrow sectoral way, a broad "Declaration of Forest Principles" is proposed. The following declaration is based on the "unofficial Land Resources: Deforestation", text from June 16, 1992). The complete text is printed here in 10 point plain. This text, however, has been expanded and altered: sections that are recommended for deletion are in *10-point italics*. Sections drawn from various sections of Agenda 21 (1992), the Rio Declaration (1992), World Charter of Nature (1982) and Preservation of cultural and Natural Heritage (1972) are in 10 point plain underlined. Recommendations made by environmental groups are in **10 bold** drawn from various recommendations, and comments and titles are in **12-point CAPITALS****

### 3. SECTION BY SECTION ANALYSIS OF "LAND RESOURCES: DEFORESTATION" DOCUMENT WITH SUGGESTED DELETIONS AND ALTERATIONS IN ORDER TO ACHIEVE A PROPOSED "DECLARATION OF FOREST PRINCIPLES" DOCUMENT COPY OF TEXT WITH ADDITIONS FROM ENVIRONMENTAL GROUPS AND FROM AGENDA 21 AND THE RIO DECLARATION.

#### LAND RESOURCES: DEFORESTATION

Non-legally binding [legally binding] authoritative statement of principles for a global consensus on the *management* conservation and sustainable development of all types of forests.

## PREAMBLE

(a) The subject of forests is related to the entire range of environmental and development issues and opportunities including **the right to conservation of representative ecosystems, right to non-consumptive enjoyment of forests and the right to ecologically sound employment** *the right to socio-economic development on a sustainable basis.*

b) The guiding objective of these principles is to contribute to the **conservation of forest ecosystems, and to the establishment of ecologically sound forest practices** *of the management, conservation and sustainable development of forests, and to provide for the setting aside of wilderness, for the preservation of significant unfragmented old growth systems, and for the establishment of international ecologically sound standards of true sustainability. their multiple and complementary function and uses.*

c) Forestry issues and opportunities should be examined in an holistic and balanced manner within the overall context of environment and development, taking into consideration **the mandate to set aside untouched wilderness areas, to preserve significant unfragmented old-growth forest ecosystems, as well as the non-consumptive and ecologically sound uses** *multiple functions and uses of forests, including traditional uses, and the likely economic and social stress when these uses are constrained or restricted, as well as the potential for development that sustainable forest management can offer. It is also possible to increase the value of forests through non-damaging uses such as eco-tourism and the managed supply of genetic materials. Concerted action is needed in order to increase people's perception of the value of forests and of the benefits they provide. (11.22. Deforestation)*

d) These principles reflect a first global consensus on forests. In committing themselves to the prompt implementation of these principles, countries also decide to keep them under assessment for their adequacy with regard to further international cooperation on forest issues **and for the establishment of international enforceable ecologically sound standards. These standards must give primacy to the understanding of the forest as a complex interacting ecosystem, including the "cradle to grave approach" assessment of all intrusions into the ecosystem.**

Governments, in collaboration with *industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits (20.20 e Hazardous wastes)*

e) These principles should apply to all types of forests, both natural and planted, in all geographic regions and climatic zones, including austral, boreal, sub-temperate, temperate, sub-tropical and tropical.

f) All types of forests embody complex and unique ecological processes **which are of intrinsic value in themselves (World Charter of Nature)** and which are the basis for their present and potential capacity to provide resources to satisfy human needs as well as environmental values and as such **their ecologically sound use *sound management* and their conservation** is of concern to the Governments of the countries to which they belong **[ and to the world community]** and are of value to local communities and to the environment as a whole.

g) *Forests are essential to economic development and the maintenance of all forms of life.* **have intrinsic value and are essential to all forms of life**

h) **Even though** *Recognizing that* the responsibility for forest *management, conservation and sustainable development* is in many States allocated among federal/national, state/provincial and local levels of government, each State, in accordance with its constitution and/or national legislation should pursue **international ecologically-sound standards** *these principles* at the appropriate level of government

#### Principles/elements

1. a) *States have, in accordance with the Charter of the United Nations and the principles of international law, the sovereign right to exploit their own resources pursuant to their own environmental policies and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other States or of areas beyond the limits of national jurisdiction and* States have the sovereign right to exploit their own biological resources pursuant to their environmental policies, as well as the responsibility to conserve their biodiversity and use their biological resources sustainably, (15.3 Biodiversity, Agenda 21) **and the responsibility to ensure that activities within their jurisdiction do not cause damage to the environment both within and beyond their own state, and providing that they do not violate internationally ecologically sound standards, and the responsibility to recognize the inherent worth of the forest ecosystem itself ( World Charter of Nature), to promote the setting aside of undisturbed wilderness, and to allow the forest ecosystem to renew itself**

(b) **Recognizing the importance of preservation of forest ecosystem and the setting aside of undisturbed wilderness.** The agreed full incremental cost of achieving benefits associated with forest conservation and sustainable development requires increased international cooperation and should be equitably shared by the international community. **Due consideration should be given to the designating of an increased number of unfragmented forest ecosystems under the UN Convention for the Preservation of Cultural and Natural Heritage.**

2. (a) States have the sovereign *and inalienable* right as well as the responsibility to conserve their biodiversity and use their biological resources sustainably, (15.3 Biodiversity) **and the responsibility to ensure that activities within their jurisdiction do not cause damage to the environment both within and beyond their own state, and providing that they do not violate internationally ecologically sound standards** *to utilize,*

*manage and develop their forests in accordance with their development needs and level of socio-economic development and on the basis of national policies consistent with sustainable development and legislation, including the conversion of such areas for other uses within the overall socio-economic development plan based on rational land-use policies." Inappropriate and uncontrolled land uses are a major cause of degradation and depletion of land resources. Present land use often disregards the actual potentials, carrying capacities and limitations of land resources as well as their diversity in space.* (14.34 Agriculture). **Recognizing that since the term 'management' implies that we are in fact capable of truly managing forests in a sustainable way, and since we must recognize that the forest ecosystem is complex and indeterminate, and that many of our intrusion have unexpected consequences, that we should proceed with caution by observing and drawing upon the expertise evidenced in the few existing unfragmented original growth ecosystems.**

(b) **The precautionary principle is followed in all proposed logging activity because of the potential for logging activity to cause 'serious and irreversible' damage. Forest resources and forest lands should be preserved for their inherent value (world Charter of Nature) so as to leave open a full range of non-consumptive options.**

**Other Forests should be used as resources providing that ecologically sound practices are used for harvesting and restoring the forest resources should sustainably managed to meet the social, economic, ecological, cultural and spiritual human needs of present and future generations. These needs are for forest products and services, such as wood and wood products, water, food, fodder, medicine, fuel, shelter, employment, recreation, habitats for wildlife, landscape diversity, carbon sinks and reservoirs, and for other forest products. Appropriate measures should be taken to protect forests against harmful effects of pollution, including air-borne pollution, fires, pests and diseases, and from harmful logging practices and from harmful chemicals that are used for forest "management" in order to maintain their full multiple value. to leave open options for non-consumptive use.**

(c) The provision of timely, **arms-length** reliable and accurate information on forests and forest ecosystems is essential for public understanding and informed decision-making and should be ensured.

(d) Governments should promote and provide opportunities for the participation **in the establishing of terms of reference and throughout the decision-making process** of interested parties, including local communities and indigenous people, industries, labour, non-governmental organizations and individuals, forest dwellers and women, in the development, implementation and planning of national forest policies. **taking fully into consideration adherence to international ecologically sound standards. A distinction should be made between input from vested short-term economic interest for economic gain and long-term concern about the ecological commons.**

3. (a) **International ecological standards shall provide a framework for development and strengthening of conservation and sustainable development.** National policies and strategies should provide a framework for increased efforts, including the development and strengthening of institutions and programmes for the *management, conservation and sustainable development of forests and forest lands*. **Implementation of international ecologically sound standards. These standards shall apply to all forests on public and private lands, and should draw upon ecologically sound indigenous and traditional practice that have been demonstrated to preserve biodiversity.**

b) International institutional arrangements, building on those organizations and mechanisms already in existence, as appropriate, should facilitate international cooperation in the field of forests.

c) All aspects of environmental protection and social and economic development as they relate to forests and forest lands should be integrated and comprehensive.

4. The vital role of all types of forests in maintaining the ecological processes and balance at the local, national, regional and global levels through, inter alia, their role in protecting fragile ecosystems, watersheds and freshwater *resources sources* and as rich storehouses of biodiversity ... **and International ecological sound guidelines shall be in place to ensure this vital role and the vital role of biological resources and sources of genetic material for biotechnology products, as well as photosynthesis, should be recognized, and international standards shall be in place as guidelines to ensure this vital role.**

5 (a) **Developed states and companies shall be responsible in their own country and in their country of operation for restoring the land that had previously been destroyed through ecologically unsound logging practices and through ecologically unsound silviculture practices. In developing countries, international assistance shall be given to restore land destroyed through subsistence forestry.** National forest policies should recognize and duly support the identity, culture and the rights of indigenous people, their communities and other communities, and forest dwellers. Appropriate conditions should be promoted for these groups for them **to have a representative ecosystem preserved, access to independent arms-length research, as well as** an economic stake in forest use, perform economic activities, and achieve and maintain cultural identity and social organization, as well as adequate levels of livelihood and well-being, through, inter alia, those land tenure arrangements which serve as incentives for **the sustainability the sustainable management** of forests. **A distinction should be made between "forest dwellers" and forest exploiters (those who go into the forest primarily to exploit the forest as a resource). The practice of destroying forest lands for the growing of cash crops for external markets as part of the current model of development should be halted.**

b) The full participation of women in all aspects of *management*, conservation and sustainable development of forests should be actively promoted.

6. (a) All types of forests play an important role in meeting energy requirements through the provision of a renewable source of bio-energy, particularly in developing countries, and the demands for fuelwood for household and industrial needs should be met through sustainable forestry *management*, afforestation and reforestation. *To this end, the potential contribution of plantations of both indigenous and introduced species care should be taken to resist the introducing of off-site planting for the provision of both fuel and industrial wood should be recognized. " Despite mounting efforts over the past 20 years, the loss of the world biological diversity, mainly from habitat destruction, over-harvesting, pollution and the inappropriate introduction of foreign plants and animals has continued. (15.3 Biodiversity, Agenda 21)*

b) National policies and programmes **in accordance with international ecologically sound standards** should take into account the relationship, where it exists, between the conservation, *management* and sustainable development of forests and all aspects related to the production, consumption, recycling and/or final disposal of forest products, **and that international trade agreement shall not require states to relax high environmental standards.**

(c) Decisions taken on the *management*, conservation and sustainable development of *forest resources* **forests** should benefit to the extent practicable from a comprehensive assessment of economic and non-economic values of forest goods and services and of the environmental costs and benefits. The development and improvement of methodologies for such evaluations should be promoted.

d) The role of planted forests and permanent agricultural crops as sustainable and environmentally sound sources of renewable energy and industrial raw material should be recognized, enhanced and promoted. The contribution to the maintenance of ecological processes, to offsetting pressure on primary/old-growth forest and to providing regional employment and development with the adequate involvement of local inhabitants should be recognized and enhanced.

(e) Natural forests also constitute a source of goods and services and their conservation; sustainable *management* development and use should be promoted.

7. An effort should be made to promote a supportive international economic climate conducive to sustained and environmentally sound development of forests in all countries, which include, inter alia, the promotion of sustainable patterns of production and consumption, the eradication of poverty, and the promotion of food security.

8. (a) Efforts should be undertaken towards the greening of the world. All countries, notably developed countries **in accordance with international**

**ecologically-sound standards**, should take positive and transparent action towards reforestation, afforestation and forest conservation, as appropriate.

(b) Efforts to maintain and increase forest cover and forest productivity should be undertaken in ecologically, economically and socially sound ways through the rehabilitation, reforestation and re-establishment of trees and forests on unproductive, degraded and deforested lands, as well as through **allowing previously destroyed forests to regenerate themselves** *the management of existing forest resources*.

(c) The implementation of national policies and programmes aimed at forest *management*, conservation and sustainable development, particularly in developing countries, should be supported by international financial and technical cooperation, **in accordance with International ecologically sound standards**, including through the private sector, *where appropriate*, **and should not violate principle 14 of the Rio Declaration, or the principles in the Biodiversity Convention**.

(d) Sustainable forest *management and use* should be carried out in accordance with national development policies **that do not violate international conventions such as Biodiversity as well as international ecologically-sound standards**, *and priorities and on the basis of environmentally sound national guidelines. In the formulation of such guidelines account should be taken, as appropriate, and if applicable, of relevant internationally agreed methodologies and criteria*.

(e) Forest *management conservation and use* should be integrated with *management of adjacent areas* so as to maintain ecological balance and **sustainability sustainable productivity**.

(f) National policies and/or legislation aimed *at management*, conservation and sustainable development of forests, should include the protection of ecologically viable representative or unique examples of forests, including primary/old-growth forests, cultural, spiritual, historical, religious and other unique valued forests of national importance; **these forests should be distributed widely throughout each state and throughout the world**,

(g) Access, **shall be required to comply with international ecologically sound standards**, to biological resources - including genetic material, shall be with due regard to the sovereign rights of the countries where the forests are located and to the sharing on mutually agreed terms of technology and profits from biotechnology products that are derived from these resources.

(h) National policies should ensure that environmental impact assessments should be carried out where actions are likely to have significant adverse impacts on important forest resources, and where such actions are subject to a decision of a competent national authority. **Conversely it must also be recognized that forest practices have and continue to have significant adverse impacts on the land and water base, and that the impact of forest practices must also be under the purview of environmental impact assessment. To determine the environmental impact, states shall apply international ecologically sound standards, established by an independent, arms-length research body, and**

Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42 Settlement, Agenda 21)

9 (a) The efforts of developing countries, to strengthen the *management*, conservation and sustainable development of their forests resources should be supported by the international community taking into account the importance of redressing external indebtedness, particularly where aggravated by the net transfer of resources to developed countries, as well as the problem of achieving at least the replacement value of forests through improved market access for forest products, especially processed products. In this respect, special attention should also be given to countries undergoing the process of transition to market economies. **No state shall be required to log a forest to service international debt or to comply with international trade regulations. Debt remission for preservation of significant forest areas should be instituted.** "States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health."(Principle 14, Rio Declaration)

(b) The problems that hinder efforts to attain the conservation and sustainable use of forests *resources* and stem from the lack of alternative options available to local communities, in particular the urban poor and poor rural populations who are economically and socially dependent on forests *and forest resources*, should be addressed by Governments and the international community.

(c) National policy formulation with respect to all types of forests **shall give primacy to the fulfillment of high international ecological standards and not compromise those long-term ecological principles for the sake of short-term economic gain, but rather attempt to convert ecologically unsound practices to ecologically sound practices.** *should take account of the pressures and demands imposed on forest ecosystems and resources from influencing factors outside the forest sector and intersectoral means of dealing with those pressures and demands should be sought.*

11. New and additional financial resources should be provided to developing countries to enable them to sustainably *manage*, conserve and develop their **forests forest resources**, including afforestation, reforestation and combating deforestation, forest and land degradation **through the use of ecologically sound practices and substances such as selective logging, safe alternative pest control method.**

12. In order to enable in particular developing countries to enhance their endogenous capacity and to better *manage*, conserve and develop their **forests forest resources**, the access to and transfer of environmentally sound technologies and corresponding know-how on favourable terms, including on concessional and preferential terms, as mutually agreed, in accordance with the relevant provisions of Agenda 21, should be promoted, facilitated, and financed, as appropriate, **and in accordance with principle 14 ( anti-dumping principle) of the Rio Declaration, and in accordance with the precautionary principle.**

13 (a) Scientific **arms-length** research, forest inventories and assessment, carried out by national institutions, **in accordance with international ecologically-sound standards**, which take into account, where relevant, **wilderness**, biological, physical, social and economic variables, as well as the technological development and its application in the field of *sustainable forest management*, conservation and development, should be strengthened through effective modalities, including international cooperation. In this context, attention should also be given to research and development of sustainably harvested non-wood products. (WHAT WOULD THIS INCLUDE? HUNTING?, MEDICINES?)

(b) National and where appropriate, regional and international institutional capabilities in, education, training, science, technology, economics, anthropology and social aspects of forests, **wilderness** and forest **sustainability management** are essential to the conservation and sustainable development of forests and should be strengthened.

(c) International exchange of information **on the results of the intrinsic worth of forest ecosystems, on significance of wilderness and on ecologically sound forest practices** *forest and forest management* research and development should be enhanced and broadened, as appropriate, making full use of education and training institutions, including those in the private sector. **The international community shall set up an independent body to determine the accuracy of the claims made by multinational forest companies, and to establish a set of international standards of ecologically sound forest practices.**

(d) Appropriate indigenous capacity and local knowledge regarding the conservation and sustainable development of forests should, through institutional financial support and in collaboration with the people in local communities concerned, be recognized, respected, recorded, developed and, as appropriate, introduced in the implementation of programmes, **and their input sought in the establishment of international standards of ecologically sound forest practices.** Benefits arising from the utilization of indigenous knowledge should therefore be equitably shared with such people.

14. (a) **Given the urgency of deforestation and soil degradation that was recognized by the global community in Agenda 21, fundamental environmentally sound principles must be given primacy in any trade negotiations.** *the Trade in forest products should be based on non-discriminatory and multilaterally agreed rules and procedures consistent with international trade law and practices. In this context, open and free international trade in forest products should be facilitated.*

(b) *reduction or removal of tariff barriers and impediments to the provision of market access and better prices for higher value-added forest products and their local processing should be encouraged to enable producer countries to better conserve and manage ,* **sustain and allow for the renewal of their forests** *their renewable forest resources*, and the export of resources, such as raw logs, cants and wood chips, that detract from value-added forest production, must be discontinued.

(c) **Since true environmental costs, assessed by an independent environmental audit, have been ignored in the process of decision making about forest use, environment costs and benefits must be assessed.** Incorporation of environmental costs and benefits into market forces and mechanisms. In order to achieve forest conservation and sustainable development, should be encouraged both domestically and internationally, and

(d) **Forest conservation and sustainable development policies shall be given primacy and should not be compromised by economic policies** *should be integrated with economic, trade and other relevant policies.*

(e) Fiscal, trade, industrial, transportation, and other policies and practices that may lead to forest degradation should **shall** be avoided. Adequate policies, aimed at *management*, conservation and sustainable development of forests, including *where appropriate incentives for the conversion from ecologically unsound practices* should be encouraged.

*15(a) Unilateral measures, obligations or agreements, to restrict and /or ban international trade in timber of other forest products should be removed or avoided, in order to attain long-term sustainable forest management*

16. Pollutants, particularly air borne pollutants, including those responsible for acidic deposition, that are harmful to the health of forest ecosystems at the local, national regional and global levels should be controlled, **and the use of harmful pesticides in forestry should be reduced and eventually eliminated.**

Governments, in cooperation with relevant international organizations and programmes, should carry out national reviews, as appropriate, of previously accepted pesticides whose acceptance was based on criteria now recognized as insufficient or outdated and of their possible replacement with other pest control methods, particularly in the case of pesticides that are toxic, persistent and/or bio-accumulative. (19.55 b Toxic chemicals))

" Integrated pest *management*, which combines biological control, host plant resistance and appropriate far practices and minimizes the use of pesticides, is the best option of the future as it guarantees yields, reduces costs, is environmentally friendly and contributes to the sustainability of agriculture. (14.74 Agriculture)

"Promoting the use of environmentally less harmful pesticides and fertilizers and alternative methods for pest control, and considering the prohibition of those found to be environmentally unsound (17.28 i)

( ) THAT in March 1993, I prepared for the International Law and Obligations Institute (project) a Report Card on the BC governments compliance with the Framework Convention on Climate Change on the occasion of the coming into force of the Convention [I received a note from the BC Law Society which informed me that I could not use ‘ international law” in the title; their concern surprised me because generally the Law Society had little interest in international law .

( ) THAT 1993 Modified, extended and circulated Climate change report card

( ) THAT 1993, I created a Composite diagram on "Climate Change: identification of issue, response, evaluation, monitoring, enforcement" linking information from 8 different countries. A follow-up to a project based in Harvard on Social Learning related to climate change.

( ) THAT in 1993, I analyzed and co-authored “An Analysis of the Discrepancy between NDP policies passed through resolutions at NDP Conventions and NDP Government Policy” in context of Canadian obligations; this paper was distributed at a Press Conference at the BC Legislature.

( ) THAT in 1993, I Co-authored the paper “A Critique of the Roundtable proposal for Education for Sustainability” in the context of Canadian obligations Submitted to the Roundtable on Environmental Education

( ) THAT in 1993, I co-drafted and circulated the paper “Criteria for determining the appropriateness of educational material on environmental issues.” These criteria were submitted to the Environmental Educators Professional Association and we collaborated with the Environmental Educators Committee of the BCTF on the formulation of criteria for judging the appropriateness of issue-related educational materials in the classroom. (1993)

( ) THAT in 1993 I went to meeting in Vancouver on Canada's proposal for addressing the issue of climate change. I asked a question about the reason for Canada caving into to the lobbying from the greenhouse gas producers.

( ) THAT in 1993, I represented the Vancouver Peace Society and the Greater Victoria Disarmament group and I submitted a brief to Defence Policy Review Panel. A Commander said, at one point, Don't you wish that when hostilities break out that there are strong men to protect you.”

( ) THAT in from 1991—1994 I Reviewed provincial policy documents such as CORE Charter, B.C. Environmental Bill of Rights, the B.C. Prevention Act, the Forest Practices Code; B.C. Standards for Pollution Prevention, and indicated the inconsistency of these documents with other Federal and international documents.

( ) THAT in 1993, I co-authored a proposal for Principle-based education  
EXHIBIT

### **Interdependence of issues in principle-based education**

by Joan Russow, sessional lecturer in global issues, Environmental studies Program, University of Victoria, attended the Earth Summit at Rio. On the

Board of Directors of the Vancouver Island Peace Society; Greater Victoria Disarmament Group, Vancouver Island Human Rights Coalition, and the World Federalists. Co-founder of the ERA Ecological Rights Association

and

David White, teacher, Path Finder's Program, ESL, environmental educator, Board of directors of B.C.E.N., of the Canadian Partnership for International Community Forestry (Treeroots); of the Vancouver Island Network of Environmentalist (VINE);

C.E.N. Education Caucus; Chair of Sierra Club (Victoria Group).

Too often international crises have been fragmented into component crises which are examined independently, rather than striving to address the complex of crises concurrently. This fragmentation is reflected in separate international documents that focus on human rights, such as: the Universal Declaration of human Rights and the two complementary international covenants; other documents that focus on peace such as Atmospheric Test Ban ; Nuclear Non-proliferation, SALT 1 and II , START 1 and START II; and further documents that focus on the environment - World Charter of Nature, United Nations Conference on the Human Environment (UNCHE) among many others.

In many cases, however, there is a momentary recognition of the interdependence of crises, followed by the persistent fragmentation into components. For example, in the preamble to Agenda 21, from UNCED, the following assessment of the interdependence of crises was made:

“Humanity stands at a defining moment in history. We are confronted with a perpetuation of disparities between and within nations, a worsening of poverty, hunger, ill health and illiteracy, and the continuing deterioration of the ecosystems on which we depend for our well-being...” (1.1 Preamble, Agenda 21, UNCED, 1992)

[it is important to note that, in general - except for one reference - any mention of the military was excluded, other than in their affirmation in the Rio Declaration of the Stockholm convention which contained the following principle: Principle 26

“Man, and his environment must be spared the effects of nuclear weapons and all other means of mass destruction. States must strive to reach prompt agreement, in the relevant international organs, on the elimination and complete destruction of such weapons.”(Stockholm, 1972)]

In chapter 33, however, there is an important statement about the military budget;  
member states of the United Nations made a commitment to the "the reallocation of resources presently committed to military purposes" (33.18e)

The drafters of Agenda 21 then proceeded to fragment the complexity of issues and crises into 22 substantive chapters.

There has not only been a reluctance to link different issues such as concern for the destruction of the environment, the escalation of war, the violation of human rights, the disregard for social justice and the perpetuation of inequity; but also, a reluctance to translate stated principles into action.

Throughout international documents there has been expressed concern for different components of the complex of issues and crises. Underlying this expressed concern have been fundamental principles that, if followed, could address this concern. Although there has often been and continues to be a convergence between stated concerns and fundamental principles, there is little convergence between stated concerns/principles and action. One reason for this lack of convergence could be that these principles have not been used as moral suasion to encourage governments to act. Little change will occur if there is no convergence between expressed concern/fundamental principles and concerted action to address the concerns. The public cannot call for government to comply with these principles if they are not aware that the principles exist.

We have been examining international documents, and have carried out a content analysis of the different principles enunciated in these documents. We have attempted to examine the complex of interdependent issues and corresponding crises, and extract some fundamental principles that could be

used as a basis of education. We are describing this approach to examining the interdependence of issues through internationally established principles, "Principle-based issue education "

Principle-based issue education is one-way educators could begin to make students and the general public aware of both the interdependence of issues and of these internationally agreed-to principles which have been promulgated as solutions to crises arising from these issues. The essence of "principle-based education" resides in the conviction that as an international community we have agreed to some fundamental principles, and that the introduction of these fundamental principles in the educational system could provide a framework for the discussion of the interdependence of issues.

In 'principle-based education, principles related to preventing the destruction of the environment, the escalation of war, the violation of human rights, the disregard for social justice and the perpetuation of inequity have been extracted from international documents. These internationally endorsed principles become the foundation for an educational program.

Often in "education about issues," in the name of objectivity, a "both-sides", or "balanced" approach is advocated. Issues are presented as reflecting different values, and because of the difference, opposing views are considered to be legitimate. In this "both-sides" approach, students are often encouraged to explore positions which may be in contradistinction to principles that have been endorsed internationally. The justification for this "both sides" approach is the need to counteract indoctrination that could often result from "value-based" indoctrination.

A distinction, however, should be made between value-based indoctrination and principle-based education. In indoctrination the values that are presented are usually those that comprise the belief system of the educator. In principle-based education, on the other hand, the ideas around which the lessons are developed are drawn, not from an educator's particular belief system, but from internationally endorsed principles.

1 "Principle-based education" was introduced in 1985 in Russow, J. " A Method of teaching Human Rights;" In this publication, the concept of "principle-based issue education" and the method of "Issue-principle analysis" were introduced and "the violation of Human Rights" was extended to include

the destruction of the environment, the escalation of war, the disregard for social justice and the perpetuation of inequity.

Principle-based education, which has been used to expand on issues within single disciplines and to integrate different disciplines, will be analyzed in the following way:

- through exploration of the complexity and interdependence of issues and principles;
- through documentation of fundamental principles that emerged from UNCED and from other international conventions, declarations, conferences and agreements, such as the following:

Universal Declaration of Human Rights, 1948; Atmospheric Test Ban (1963); Nuclear Non-proliferation, 1968; International Covenant of Social, Cultural Rights ; Stockholm Conference on the Human Environment, 1972; UN Conservation of Natural Heritage, 1972; Convention on International trade in Endangered Species of Wild Fauna and flora (Washington), 1973; the World Charter of Nature, 1982; Non-proliferation of Nuclear weapons, SALT Montreal protocol on substances that deplete the ozone layer 1987; Convention on the Rights of the Child 1989; Convention for the Control of trans-boundary movements of hazardous wastes Basel Convention 1989; the Caracas Declaration 1992; Rio Declaration and Agenda 21, 1992 .

- through preparation of ideagraphs<sup>2</sup> (diagrammatic representation of the complexity and interdependence of issues and principles); and through the introduction of ideographs as a mode of instruction<sup>3</sup>.
- through the preparation of an International Principle Diagram in which the complexity and interaction of international principles is delineated. In this diagram the principles that have been endorsed internationally can be seen in the larger context of a range of principles. The class will be encouraged to add as many principles as possible. Through this international principle diagram, students will be able to assess which principles have been globally endorsed, and which have not.
- through explanation of "issue-principle analysis" which is an approach to principle-based education. The following is an outline of a range of possible processes in "issue-principle analysis" that could be used to stimulate thinking about issues and principles

## "Issue-principle analysis"

- Locating the principle within "International principle diagram" for example, the precautionary principle

" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).

- clarifying terms and concepts within the principle through ordinary language analysis
- discerning a range of issues within principle
- introducing actual cases related to principle
- establishing criteria for determining whether the principle would apply to these cases
- applying principle to actual cases
- extending the principle or combining principles in response to cases
- generating hypothetical cases
- applying principle to hypothetical cases
- extending principle or combining principles in response to hypothetical cases
- clarifying range and limit of principle
- examining interconnection of principle with other principles

2. Russow, J: 1973-1992: Ideographs: collection of diagrams displaying complexity and interdependence of issues

3. White, D. & Russow, J. & (1992): Ideographs as a Mode of Instruction. Prepared for the Victoria School Board.

( ) THAT in 1993, I was asked by professor Rod Dobell to replace him at a meeting with Federal Forest minister Jag Maini in Vancouver. The meeting was to be a follow up to Rio. He was not able to attend and suggested that I take his place.

### COMMENT

Around the table sat representatives from Fletcher Challenge, Mac Blo, Patrick Moore, and a former NGO. . Forester from New Zealand see notes. Jaq Maini welcomed everyone by saying: "this is just like Rio when we all met." I was thinking that certainly did not include me; I was not part of his pre-Rio corporate entourage. Everyone at the table introduced himself [ I think that I was the only women there]. Patrick Moore introduced himself as being with Greenpeace but now he was "Reasonable" another NGO said the same thing. I realized that that "being

Reasonable was a code word for "being willing to compromise." I introduced myself as being involved in the protection of old growth forests

( ) THAT in 1993 I began to document Principles of Compliance based on international law  
Russow, J (1993, this was updated yearly-2001)

1993 Prepared a content analysis of federal documents related to the continued berthing of nuclear-armed capable, or nuclear powered vessels in Victoria and Esquimalt harbours, as an affidavit for the Vancouver Island Peace Society's court case calling for an environmental Assessment review under Environmental Assessment Review Program (EARP) Guidelines

( ) THAT in 1993, I Submitted a policy document to the Roundtable on Pulp and Paper. "Principles" including principles from international law and a critique of the National Round Table on the Environment's set of Principles related to the pulp and paper industry,

#### EXHIBIT

( ) **THAT** as the Chair of the BCEN International Caucus, I was contacted about having input into the document emerging from the Pulp and Paper Roundtable. The document was a perfect example of the problems with the Round Table approach: compromise leading the lowest common denominator. I read the document in which there was a list of environmental groups, including the Sierra Club of Canada, that had already had input into the document but there was no reference to the obligations and commitments from Rio. Often, in the Roundtable process often there is misrepresentation of support; the government lists groups that have been consulted during the process and there is the presumption, because often the roundtable requires consensus. In many cases, those who were consulted during the process could be in disagreement with the resulting document

#### EXHIBIT

Pulp and Paper *Round Table* Principles  
April 13, 1993

#### GENERAL PRINCIPLES

Many of these problems have arisen from a development model that is environmentally destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. (Agenda 21, UNCED18.45)

1. the members of the Pulp and Paper round Table believe that the **equitable and ecologically** sustainable production of pulp and paper is dependent on the cooperation and willingness of **citizens all stakeholders** to recognize and support the necessity for developing actions plans related to the following principles:

• reduction of consumption moving away from current model of consumption (Agenda 21)

- ecological limits
- **Ecosystem shall not be compromised for economic interests**
- **Principle shall drive industry not industry driving principles**
- ecosystem interaction
- **strengthen of standards and technical regulations to encourage prevention technology**
- **conservation and** protection of biodiversity (Biodiversity Convention)
- precautionary principle action in the face of uncertainty (Biodiversity Convention)
- education and safety of the public and the workforce
- meaningful public participation
- responsibility for employment
- recognition of Aboriginal rights and values
- socially responsible marketing practices
- marking of products that have not complied with ecologically safe and sound production and have led to a loss of biodiversity**
- **no old growth wood shall be used for pulp and no wood derived from ecologically unsound practices such as clear cutting**
  - " large-scale clearcutting is the cheapest, fastest and most profitable way for timber companies to log our land. about 90% of B. C's publicly-owned forest land is now logged by clear-cut. Not only do modern clear-cutting methods use fewer people and bigger machines, they are also an environmental disaster" p. 7 Jobs, trees and US the PPWC's Forest Policy
- **revelation of resource extraction practices on labels of all pulp and paper products**
- **Export permits shall not be granted for products arising from ecologically unsafe and unsound practices**
- role and responsibilities of consumers. **Con**
- compliance with regulations and use of other instruments
- **arm's length** research and development
- **replacement of ecologically unsafe and unsound technologies with ecologically safe and sound technologies**
- **government shall allot funding for alternatives to the use of pulp and paper and shall support research into alternatives and ensure that the research into alternatives is not controlled by an industry that could benefit from the alternatives not being introduced**
- global responsibility international **standards and technical regulations shall be considered as a minimum**
- **shift in the onus of proof: the proponents of an intervention shall demonstrate that the intervention is ecologically safe and sound**

## 2. WORKING WITHIN ECOLOGICAL LIMITS

**The ecosystem shall be given primacy and human activities shall be determined by ecological limits**

There are ecological limits to pulp and paper production. These limits include the capacity of the ecosystems to provide resources sustainably as well as the ability of ecosystems to cope with production wastes and cumulative impacts of human activities. *Over time these limits may be expanded or contracted*

### 3. ECOSYSTEM INTERACTION

the pulp and paper industry recognizes that its resource acquisition, manufacturing processes, use and disposal of products have impacts on regional and global ecosystems. **Governments shall set high emission standards that will ensure that the ecological limits are respected.** The industry will cooperate in researching, monitoring, and minimizing these impacts. It accepts its share of the responsibility for:

- adopting sustainable land-use and improved production practice such as **only accepting harvested wood from second growth through ecoforestry principles** pollution prevention, closed-loop technologies, recycling and recovery programs
- increasing efficiency in production, reducing, reusing and recycling of resources, and resource management practices which over time may affect either the forest base or its productivity

when pulp and paper activities are **thought known** to have unacceptable effects on ecosystems **governments to not have to wait for scientific certainty about the unacceptable effects to ban the activities.** For example, it shall be mandatory for industry to submit plans for phase-out of use of chlorine, and mandatory to implement these plans

"Most of the science on organochlorines shows us that the reason they are of concern is that they build up and move through the food chains and have impact on the progeny and on predator species (Gordon Perks Times Colonist Oct 2, 1992)

1989 B.C. promised regulations to require all B.C. pulp mills (1) to install secondary treatment and (2) to reduce organochlorine (AOX) discharges to 2.5 Kg per tonne of pulp production by the end of 1991 and to 1.5 by the end of 1994 (West Coast Environmental Law Research Foundation Spring 1990) Note even at the 1.5. level there will be almost 23 tonnes of AOX per day. ... this underscores the Pulp Pollution Campaign's argument that 1.5. is not low enough.

The strongest environmental regulations in Canada shall be the minimum; re of National and best available technology shall be incorporated into regulations. the National

### PROTECTION OF BIODIVERSITY

**4. An environmental assessment review of the impact of pulp and paper industrial activities and substances used that could contribute to the loss or reduction of biodiversity shall be carried out as required under the Biodiversity Convention. A life cycle analysis of all the environmental impacts of each stage of production, including the**

**destruction caused by extracting the resources for the production of pulp and paper, shall be carried out by government.**

Pulp and paper industrial activities must protect the biodiversity of both source and receptor ecosystems

#### ACTION IN THE FACE OF UNCERTAINTY

Where there are threats of serious or irreversible damage to the environment or human health, decision makers **shall should act making use of the best information available to them.** they shall *should* not use lack of scientific certainty as a reason for postponing action to prevent environmental degradation and to protect human health.

**Governments in their technical regulations shall invoke the precautionary principle in that governments do not have to wait until there is scientific certainty that environmental degradation will occur in relation to the pulp and paper industry for the use of substances such as chlorine and other ecologically unsound chemicals to be discontinued.**

**It is the duty of decision makers to ensure that not only shall they act to prevent environmental degradation and harm to human health but also, they shall anticipate ...**

**Follow not only the precautionary principles but also the cautionary and anticipatory principle**

"...reasonable medical concerns ...long precede certainty. Yet the statutes - and common sense - demand regulatory action to prevent harm, even if the regulator is less than certain that harm is otherwise inevitable." Justice Wright, US. Court of Appeals, Ethyl Corp v E.P.A. 1976, 541 G 2d 1 (cited in Elimination of organochlorines: Round Table to Become Excuse for Inaction? [B.C.] "Special Pulp Pollution Edition, Spring 1990 West Coast Environmental Law Research Foundation

Sweden has set a zero organochlorine discharge limit for Swedish pulp mills by the year 2000 (the Pulp, paper and woodworkers of Canada local #10)

the use of Chlorine must be completely eliminated ... (the Pulp, paper and woodworkers of Canada local #10)

20.2. Prevention of the generation of hazardous wastes and the rehabilitation of contaminated sites are the key elements, and both require knowledge, experienced people, facilities, financial resources and technical and scientific capacities.  
(Agenda 21)

20.6. Within the framework of integrated life-cycle management, the overall objective is to prevent to the extent possible, and minimize, the generation of hazardous wastes, as well as to manage those wastes in such a way that they do not cause harm to health and the environment.

Overall targets

20.7. The overall targets are:

(a) Preventing or minimizing the generation of hazardous wastes as part of an overall integrated cleaner production approach; eliminating or reducing to a minimum trans-boundary movements of hazardous wastes, consistent with the environmentally sound and efficient management of those wastes; and ensuring that environmentally sound hazardous waste management options are pursued to the maximum extent possible within the country of origin (the self-sufficiency principle). The trans-boundary movements that take place should be on environmental and economic grounds and based upon agreements between the States concerned;

#### ZERO EMISSIONS OF PERSISTENT TOXIC

that must be zero use, production, and release in all cases where a toxic substance is persistent or bioaccumulative. It also applies when a substance will generate persistent or bioaccumulative toxic byproducts or breakdown products during its productions, use or disposal (zero Toxics Alliance Statement of Principles) that must not be exceeded to protect the [ecosystem — water, air, sediment, soil or biota) and]

#### EDUCATION AND SAFETY OF THE PUBLIC AND WORKFORCE

6.

##### **-Education about alternatives**

**The public must be informed about the real alternatives between selecting ecologically unsafe and unsound bleached and ecologically safe and sound bleached and unbleached paper and standards must be set so that ecologically safe and sound alternatives to the chlorine bleaching process be in place. Governments shall set an example by only buying paper that is unbleached or has been bleached by an ecologically safe and sound means. Industry shall discontinue attempting to persuade the public that ecologically unsound and unsafe practices such as the use of chlorine bleach is safe and sound.**

##### **Education about work place**

Worker health, safety and well-being must be promoted and protected in the production, use and disposal of pulp and paper products.

Public health, safety and well-being must be promoted and protected in the production use and disposal of pulp and paper products.

**All activities and substances that do not contribute to worker and public health and safety and well-being shall be discontinued**

##### **Education in the School system**

**In chapter 36 of Agenda 21, a very important distinction is made between promoting "education," promoting "public awareness," and promoting "training." It appears to be clear in Agenda 21 that non-governmental organizations, community-based groups, women's groups and aboriginal groups are called upon to assist educational authorities**

**in reorienting education. The role of industry is ascertained to be limited to specific areas of business and industrial and training programs.**

" Educational authorities, with appropriate assistance of non-governmental organizations, including women's and indigenous peoples' organizations should promote all kinds of adult education programmes for continuing education in environment and development, basing activities around elementary/secondary schools and local problems. The authorities and industry should encourage business, industrial and agricultural schools to include such topics in their curricula. The corporate sector could include sustainable development in their education and training programmes. Agenda 21, section 36.5 l

**In the section of Agenda 21 that addresses the "promoting of public awareness " industry is included not as the dispenser of "education" but as the recipient of needed education.**

"Countries and regional organizations should be encouraged, as appropriate, to provide public environmental and development information services for raising the awareness of all groups, the private sector and particularly decision makers. (Agenda 21, section 36.10 c)

**In the section of Agenda 21, that addresses the "promoting of training, an important role for industry is envisioned.**

To strengthen national capacities, in training, to enable governments, employers and workers to meet their environmental and development objectives and to facilitate the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know -how (Agenda 21, 36.13 c)

**This section gives industry a very important mandate to assist in the retraining of employees to environmentally sound and socially acceptable technology. Rather than fulfilling this significant mandate, industry has embarked on a campaign to persuade through educational institutions and through public relations campaigns that their practices which have been universally condemned are "ecologically sound," or protective of "biodiversity." They have interpreted their mandate to educate the students in the regular academic program on "sustainability; economic, environmental and social" thus with this re-designation they have eliminated both "environmental education," and "global education**

To fulfill this mandate, they have undertaken a two-prong approach: a) to influence education by having direct access to the classroom and to classroom teachers .b) To influence education by being on boards of directors for National and Provincial Round tables that have been established to devise curriculum and develop educational materials for "sustainability",

*7. Public and workforce education programs concerning pulp and paper issues should reflect the diverse aspects, values and viewpoints of all stakeholders. They should be based on education principles that encourage critical thinking, problem-solving, and an understanding of the complexity of sustainability issues.*

*Stakeholders in the pulp and paper industry will make a commitment to developing education and training programs which promote life-long learning so that the workforce will be capable of understanding, adapting and responding to sustainability issues*

**Educational programs shall reflect the primacy of the ecosystem and its limits and ecologically safe and sound practices and not the interests of stakeholders.**

**Education ... shall be prepared and passed by a panel composed not of vested interest stakeholders but of individuals reflecting various areas of expertise and experience in the protection of human health and the environment.**

## MEANINGFUL PUBLIC PARTICIPATION

8. decision makers must be committed to fair, effective and responsible processes of public participation in policy, planning and decision making affecting the ecosystem and the community

9. The pulp and paper industry will provide the public with information about its manufacturing processes and products that will allow the public to make informed decisions concerning the industry and its products.

## RESPONSIBILITY FOR EMPLOYMENT

10. The pulp and paper industry recognizes the problems caused by employment losses in its industry and agrees to share responsibility with affected communities and others for early planning for cooperative and effective solutions. Protecting employment is the preferred course of action. Solutions to correct and/or alleviate the impacts of losses that cannot be avoided are diverse and often site-specific. These solutions should:

- should be community-based
- consider a wide range of options for new employment opportunities

- ensure that ecosystems should be remediated so as not to impede future sustainable economic development

### **Sustainably ecological use**

#### RECOGNITION OF ABORIGINAL RIGHTS AND VALUES

11. Sustainable production of pulp and paper must honour the rights and values of Aboriginal people, and address the impacts of its activities on the health, economies and traditional lifestyles of Aboriginal communities.

**Sustainable production of pulp and paper must neither compromise the rights and values of Aboriginal people nor adversely affect the health, economies and traditional lifestyles of Aboriginal communities.**

**Sustainable production of pulp and paper will not adversely affect the health, economies and traditional lifestyles of Aboriginal communities.**

to be finalized

#### **ECOLOGICALLY AND SOCIALLY RESPONSIBLE MARKETING PRACTICES**

12. the pulp and paper industry recognizes its role and responsibility to promote and market pulp and paper products that are produced in a sustainable manner: This includes promoting products on the basis of environmental excellence, for example.

- made using methods that minimize the impact on ecosystems
- that maximize the efficient use of resources through conservation, durability, reusability and recyclability
- that add value to the resources and to create and maintain employment
- that encourages responsible use and discourages wasteful use of paper products

#### COMMITMENT TO RECOVERY SYSTEMS -to be finalized

Industry will share responsibility and work cooperatively with municipalities and others to develop *feasible and viable* systems for the collection, processing and re-use of recycling of the industry's products

#### ROLE AND RESPONSIBILITIES OF CONSUMERS

13. Consumers should **shall** eliminate the unnecessary consumption of paper products, and reduce, reuse and participate in recycling programs where possible.

**Governments shall support recycling programs and make available products with recycled content, and regulations shall be in place to encourage companies marketing recycled products to find ecologically sound and efficient means of recycling products.**

**Government shall undertake to require recycled products in all government use and publications**

Where available consumers should purchase products with recycled content

#### COMPLIANCE WITH REGULATIONS AND USE OF OTHER INSTRUMENTS

14. Achieving **ecological** sustainability in the pulp and paper sector requires mandatory compliance by the industry with standards and technical

regulations [wording in NAFTA] regulatory standards and strict enforcement of those standards by regulators

Technical regulations shall be high so as to encourage prevention technology [doing it right the first time- avoiding necessity for mitigative measures] and guided not only by the precautionary principle but also the cautionary and anticipatory principles

**Given that there is a commitment to work within the limits to the ecosystem, the ecosystem shall be given primacy in all formulation of technical regulations.**

An appropriate blend of economic and other incentives and practices should be used to achieve performance which exceeds minimum enforceable standards, provided they are used as a complement to, rather than a substitute for, regulatory standards.

Compliance with regulatory standards, incentives and practices must be monitored and audited with full disclosure to the public

there should be continuing examination and review of any overlapping and conflicting regulations with regard to policy, planning and uniform enforcement, Governments should design systems, with **input from a body of citizens with a wide range of experience and expertise at the time of formulating the terms of reference with stakeholders' input**, whereby jurisdictional responsibility is clear and consistent.

## RESEARCH AND DEVELOPMENT

15.

**Arm's length research. Industry will be required to contribute to a fund administered by an independent research industry to synthesize the research that has already being carried out into alternatives to forest derived paper. When forest practices ...**

The Canadian pulp and paper industry will take a leadership role in carrying out and supporting research and development to improve the sustainability of its raw material base including alternative sources of fibre, its processes and its products. The industry will use the results of the research and cooperate with suppliers and others to create domestic employment opportunities for supply such developments to meet the needs of both domestic and export markets.

## GLOBAL RESPONSIBILITY

**16. International standards and technical regulations shall be used as a minimum not a maximum.**

Canadian stakeholders will promote high environmental standards and sustainable production practices globally, in the manufacture and use of paper and paper products

## ENVIRONMENT INDUSTRY

**No activity that could cause environmental degradation shall be permitted for the reason that there is a coupling environment clean-up technology** May, 22, 1993

DRAFT: for discussion purposes only

"NAFTA: THE DISCREPANCIES BETWEEN THE ENVIRONMENTAL PROVISIONS IN NAFTA AND THE CANADIAN GOVERNMENT'S PUBLISHED INTERPRETATION OF THESE PROVISIONS

( ) THAT IN 1993, I Prepared for presentation at a panel discussion on

NAFTA

by

JOAN RUSSOW  
DOCTORAL CANDIDATE  
INTERDISCIPLINARY STUDIES  
UNIVERSITY OF VICTORIA

May, 22, 1993

In all three countries, Canada, Mexico and the U.S., citizens and organizations are concerned about:

- the misplacing of government priorities,
- the delusion of public process,
- the exploitation of the labour force,
- the inequitable distribution of resources,
- the disenfranchisement of the many,
- the violation of human rights and
- the denigration of social justice

In all three countries, citizens and organizations are also concerned about the unquestioned imperative to grow, the over-consumptive pattern of behavior, the relentless destruction of the environment, and the irreversible loss of ecological heritage

These concerned citizens look with justified trepidation at NAFTA

In this talk I will be examining the potential discrepancy between the stated environmental provisions in NAFTA and the Canadian Governments published interpretation of these provisions in the Canadian Environmental Review.

Background

Within Canada, United States and Mexico there are laws, policies, and regulations in place which appear to conserve, preserve and protect the environment; yet industry is continually in non-compliance with these environmental provisions, and government is continually remiss in not requiring compliance.

The three countries negotiating the NAFTA all enunciate in their national legislation environmental provisions

Mexico

**" Social liberalism** therefore proposes a State that promotes and encourages private initiative, **but has the capability to firmly regulate economic activity and thus prevent the few from taking advantage of the many; a State that channels attention and resources towards meeting Mexicans' basic needs, is respectful of labor rights and union autonomy, and protects the environment."** (Carlos Salinas de Gortare, Social Liberalism: Our Path, Mexico: On the Record. Vol. 1. No. 4 ( March 1992)

**In March 1988, Mexico enacted its General Law for Ecological Equilibrium and Environmental Protection.** it is a comprehensive statute designed to ensure that there is an adequate legal basis for protecting the environment. Indeed, the law is based in large part on U.S. law and experience.

**A central element of the 1988 law is the requirement for environmental impact assessments to be completed on all new investment projects, in both the public and private sectors. To ensure they comply with these requirements, many privately owned companies have already created special environmental offices to analyze the environmental impacts of proposed business activities** ( U.S. government publication] Free trade Negotiations with Mexico Environmental matters, p. 3 ) ARMS LENGTH RESEARCH

In Canada, the government claims that :

Canada's Green Plan is second to none in its comprehensive approach to a full range of environmental challenges, funding, accountability and provision for public involvement ," he [Mr. de Cotret ] added.

Canada's Green Plan offers new policies, programs and standards to clean up, protect and enhance our land, water and air, our renewable resources, the Arctic, parks and wildlife, and to reduce waste generation and energy use. it also includes measures to maintain global environmental security, foster environmentally responsible decision -making and improve our emergency preparedness....

. (Government of Canada's release " Federal Government releases environmental green plan" December, 1990.)

Goal

to ensure that citizens today and tomorrow have clean air, water and land essential to sustaining human health and the environment....p. 1 ....

## INITIATIVES

• **Over the next five years, strengthen federal inspection, information exchange and investigation programs to better enforce environmental regulations ....**

**In 1991, develop and adopt a comprehensive Code of Environmental Stewardship covering all areas of federal operations and activities.** The Code will be complemented by a list of targets on issues ranging from waste generation to contaminated sites clean-up and emission standards, establishment of an office of Environmental Stewardship and measures to ensure that federal purchasing policies and practices integrate environmental considerations. Implementation of the code will ensure that the activities and operations of the federal government meet or exceed the standards and practices it is recommending for others. ( p. 21) Government of Canada's release " Federal Government releases environmental green plan" December, 1990.)

In the United States, President Bush stated that:

We will ensure that our right to safeguard the environment is preserved in the NAFTA

- we will maintain the right to exclude any products that do not meet our health or safety requirements and we will continue to enforce those requirements

- we will maintain our right to impose stringent pesticide, energy conservation, toxic waste, and health and safety standards

- we will maintain our right , consistent with other international obligations, to limit trade in products controlled by international treaties ( such as treaties on endangered species or protection of the ozone layer). [TWO OF THE VERY FEW

INTERNATIONAL AGREEMENTS SIGNED BY THE US]

• **Enhancement and Enforcement of Standards:** we will seek a commitment to work together with Mexico to enhance environmental health and safety standards regarding produces and to promote their enforcement

- we will provide for full public and scientific scrutiny of any change to standards before they are implemented.

-we will provide for consultations on enhancing enforcement capability, inspection training, monitoring and verification

( Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement.

May 1, 1991)p.p. 4, 5)

Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement.

May 1, 1991)

- we will consult on national environmental standards and regulations, and will provide an opportunity for the public to submit data on alleged non-compliance. (Response of the Administration to issues raised in connection with the

negotiation of a north American Free trade agreement. May 1, 1991, p. 5)

YET the moment that either one of the three states attempts to "enhance" environmental protection the others call forth the spectre of the trade agreement GATT:

Each one of the three states involved has attempted to object to the other state's enhancing environmental standards and in each case GATT has supported the state seeking to object to high standards:

In Canada,

**"The Canadian pulp and paper industry has urged Canada to challenge U.S. laws requiring the use of recycled fibre in newsprint. (Shrybman, 1991, p. 13)** The Canadian government has argued that a U.S. environmental Protection Agency rule banning the use of all forms of asbestos violates the U.S. Canada FTA and GATT( Eric Christensen, "Pesticide Regulations and International Trade", Environment, Vol. 32. No. 9, November, 1990, p 45)

In the U.S.

**The U.S. recently proposed in GATT negotiations that nations be prevented from adopting domestic pesticide standards more stringent than international standards. (Eric Christensen, "Pesticide Regulation and International Trade", Mark Ritchie, "GATT, Agriculture and the Environment: The US Double Zero Plan, " The Ecologist, Vol. 20, No. 6, November, 1990, p. 214.)**

**The U.S. based Non-Ferrous Metals Producers Committee is using the U.S.- Canada FTA to support its challenge to Canadian federal and provincial pollution control programs intended to reduce emissions from the Canadian smelting industry. (Shrybman "Selling the Environment Short: an environmental assessment of the first two years of free trade between Canada and the United States", Canadian Environmental Law Association, January, 1991, p. 13)** (cited in Rolfe, Chris Environmental considerations regarding a possible Mexico-Canada Free trade Agreement for the West Coast environmental law association, February, 1991).

And in Mexico ...

When in 1990 the US. placed an embargo upon tuna products from Mexico, "Mexico complained that the tuna embargo was inconsistent with obligations owed to Mexico under GATT. The September 1991 report of a three-member panel of experts

established pursuant to the third-party dispute settlement procedures of GATT determined that the American embargo on Mexican tuna, even though designed to conserve dolphins [s] was inconsistent with the GATT ( McDorman, T. 1991, p. 2)

It would appear that, in all three countries (including states and provinces) there is not the political will required to seriously address the urgency of the environmental crisis.

Will the NAFTA perpetuate the current North American environmental situation of strong but not-enforceable legislation and regulations, will the NAFTA worsen the current North American environmental situation or could an alternative to the NAFTA lead to stronger enforcement of environmental legislation

From the press release on Friday May 21, it would appear that the three day talks on the side environmental accords failed because the U.S. negotiator demanded the standards be enforceable through trade sanctions.

In the absence of any further information about the current discussion about the parallel accord related to the environment, I will only be able to refer to the actual NAFTA agreement itself. A representative from the Ministry of Environment, who was part of the parallel accord information loop, indicated that the purpose of the parallel accord was primarily to clarify some of the environmental provisions, and address some of the concerns expressed about some of these provisions.

#### "NAFTA: THE DISCREPANCIES BETWEEN THE ENVIRONMENTAL PROVISIONS IN NAFTA AND THE CANADIAN GOVERNMENT'S PUBLISHED INTERPRETATION OF THESE PROVISIONS

To make a comparison between the environmental provisions of NAFTA and the Canadian Government's published interpretation, I have extracted and compiled in this diagram, the provisions in the NAFTA related to the environment (see NAFTA GRAPH) and linked them to the statements published by the Canadian Government in their publication NAFTA: Canadian Environmental Review, Oct. 1992.

In this diagram I have attempted through to document five categories of statements:

1. statements in the NAFTA related to the environment
2. Statements by the Canadian Government in the Canadian Environmental Review, October, 1992. Re: the environmental implications of the NAFTA
3. Focal points to pursue related to statements in the NAFTA
4. Focal points to pursue related to statements made by the Canadian Government
5. Systemic "whereases" and "notwithstandings" within the documents that would prevent the implementation of environmental measures.

The diagram was then divided into key areas that are interrelated "standards-related measures" , "technical regulations," "relation to other documents that protect and preserve the environment," "Risk assessment and appropriate levels of protection," investment: performance requirements.

It would appear that the NAFTA does have in writing provisions to protect the environment

The NAFTA appears to involve a series of discrepancies

I will attempt to examine the discrepancies within the NAFTA and the interpretation of these discrepancies by the Canadian government in its "Canadian Environmental Review" of NAFTA along with the interpretation, by the Canadian government in the Canada U.S. Free Trade Agreement

## 1. RELATION BETWEEN ENVIRONMENTAL PROVISIONS AND OBJECTIVES

The discrepancy between Environmental provisions which limit economic pursuits in the preamble and economic pursuits in the objectives which ignore the environment

Compare preamble to Objectives

### PREAMBLE

The Government of Canada, the Government of the United Mexican States and the Government of the United States of America, **resolved to:**

STRENGTHEN the special bonds of friendship and cooperation among their nations;

CONTRIBUTE to the harmonious development and expansion of world trade and provide a catalyst to broader international cooperation;

CREATE an expanded and secure market for the goods and services produced in their territories;

REDUCE distortions to trade;

ESTABLISH clear and mutually advantageous rules governing their trade;

ENSURE a predictable commercial framework for business planning and investment;

BUILD on their respective rights and obligations under the *General Agreement on Tariffs and Trade* and other multilateral and bilateral instruments of cooperation;

ENHANCE the competitiveness of their firms in global markets;

FOSTER creativity and innovation, and promote trade in goods and services that are the subject of intellectual property rights;

CREATE new employment opportunities and improve working conditions and living standards in their respective territories;

**UNDERTAKE each of the preceding in a manner consistent with environmental protection and conservation;**

**PRESERVE their flexibility to safeguard the public welfare;**

**PROMOTE sustainable development;**

**STRENGTHEN the development and enforcement of environmental laws and regulations; and**

**PROTECT, enhance and enforce basic workers' rights;**

HAVE AGREED as follows:

**Article 102: Objectives**

1. The objectives of this Agreement, as elaborated more specifically through its principles and rules, including national treatment, most-favored-nation treatment and transparency, are to:

- (a) eliminate barriers to trade in, and facilitate the cross-border movement of, goods and services between the territories of the Parties;
- (b) promote conditions of fair competition in the free trade area;
- (c) increase substantially investment opportunities in the territories of the Parties;
- (d) provide adequate and effective protection and enforcement of intellectual property rights in each Party's territory;
- (e) create effective procedures for the implementation and application of this Agreement, for its joint administration and for the resolution of disputes; and
- (f) establish a framework for further trilateral, regional and multilateral cooperation to expand and enhance the benefits of this Agreement.

2. The Parties shall interpret and apply the provisions of this Agreement in the light of its objectives set out in paragraph 1 and in accordance with applicable rules of international law.

Canadian interpretation of the preamble and objectives  
In the introduction to the Canadian Environmental Review the following statement is made, which suggests that the environmental provisions are part of the objective section of the NAFTA:

Environmental objectives addressed during the negotiations included the identification of sustainable development and environmental protection and conservation **as fundamental objectives of the NAFTA**

In the Canadian Government document, the Canada/ US Free Trade Agreement Synopsis, the Canadian government indicates the important role of the preamble

The preamble states the political commitment ...in entering into the Agreement. It records the shared aspirations of the two countries in concluding the Agreement and summarizes their aims and objectives. In other words, it is an agreed statement of intent which will guide the countries in implementing the provisions of the Agreement and in resolving disputes. ...the object and purpose of the Agreement (13)

**ACTION:** to require that to fully express the intent of the document the government should call for the inclusion of environmental provisions in the Objectives section

## 2.INTERNATIONAL COMMITMENTS AND STANDARDS

There is a discrepancy between the "retention of rights in other documents" (even though NAFTA, in the case of inconsistency unless otherwise indicated, prevails) and the Canadian Government unqualified assertion that Canada has "preserved these rights in agreements"

In Article 103 of NAFTA states that NAFTA shall prevail in the event of an inconsistency between NAFTA and other international agreements (unless otherwise provided)

### Article 103

1. the Parties affirm their existing rights and obligations with respect to each other under the GATT and other agreement to which such Parties are party.

[note exceptions related to the environment in GATT Article XX(b) include environmental measures necessary to protect human, animal or plant life or health, and GATT Article XXg applies to measures relating to the conservation of living and non-living exhaustible natural resources]

2. in the event of any inconsistency between this agreement and such other agreements, this Agreement shall prevail to the extent of the inconsistency, except as otherwise provided in this agreement

However, in Article 903, it would appear that "rights in other documents" are retained:

Article 903 Affirmation of Agreement on Technical Barriers to Trade and Other agreements

Further to Article 103, the Parties affirm with respect to each other their existing rights and obligations relating to standards-related measures under GATT and all other international agreements including environmental and conservation agreements to which those Parties are party.

the Canadian government in its *Canadian Environmental Review* has indicated the following

During the NAFTA negotiations, all three countries expressed the wish to retain their existing rights and obligations under those multilateral environmental and conservation agreements to which they have chosen to belong. The retention of these right was also assigned a high priority by the Canadian environmental organization in both their written and oral submissions to the government. Canada has preserved these rights in the NAFTA

**ACTION: IT IS IMPORTANT TO DEMAND TO KNOW IF THE RETENTION OF RIGHTS IS NOT INCOMPATIBLE WITH THE NAFTA PREVAILING OVER THE INTERNATIONAL AGREEMENTS NOT SPECIFICALLY MENTIONED.**

[NOTE: it is important to recognize the distinction between "standard" and "technical regulation"

Standard means a document approved by a recognized body that provides for common and repeated use, rules guidelines or characteristics for goods or related processes or production methods or for services or related operating methods, with which compliance is not mandatory

whereas, a "technical regulation" means a document which lays down goods or related processes or production methods or for services or related operating methods, including the applicable administrative provisions, with which compliance is mandatory]

### 3. EXTENT TO WHICH INTERNATIONAL AGREEMENTS WILL PREVAIL

There is a discrepancy between the extent to which international agreements prevail as mentioned in the NAFTA and the extent to which the Canadian government indicates these agreements will prevail

In the NAFTA, the following is stated:

Article 104.1 obligations will prevail in  
convention on International Trade in endangered Species of  
Wild Fauna and Flora ( 1973)  
the Montreal Protocol (1990)  
Basel convention on the Control of trans-boundary Movement of  
Hazardous Wastes and their disposal (1989)  
Annex 104-1 Bilateral and Other Environmental and  
conservation Agreements  
1. The agreement between the Government of Canada and the  
Government of the U.S. concerning the trans-boundary  
Movement of Hazardous Waste, signed at Ottawa, October 18,  
1986  
2. The agreement between the U.S and Mexico on cooperation  
for the Protection and improvement of the Environment in the  
Border Area, 1983.

Article 104.1. (f) Any subsequent international environmental or  
conservation agreement that the Parties agree shall be included,  
the international agreement will prevail

The Canadian government through its Canadian Environmental Review  
indicated:

the prevalence, in the event of inconsistency, of trade  
obligations set out in international environmental and  
conservation agreements over the NAFTA trade disciplines  
(Intro, CER)

In other words these international environmental or conservation  
agreements will take precedence over the NAFTA (CER find  
page ref)

**ACTION: THAT CANADA INSIST IN HAVING ALL THE INTERNATIONAL  
AGREEMENTS RATIFIED BY CANADA INCLUDED IN THIS AGREEMENT  
AND THAT THESE INTERNATIONAL AGREEMENT SHOULD TAKE  
PRECEDENCE OVER THE NAFTA [UNLESS THE ENVIRONMENTAL  
PROVISIONS IN THE NAFTA ARE STRONGER] AS STATED IN THE  
CANADIAN GOVERNMENT'S INTERPRETATION OF NAFTA.  
INTERNATIONAL AGREEMENTS SHALL INCLUDE MORAL  
COMMITMENTS ARISING OUT OF INTERNATIONAL DOCUMENTS SUCH  
AS UN CONVENTION FOR THE PRESERVATION OF CULTURAL AND  
NATURE (1972), AND UNCED DOCUMENTS SUCH AS THE RIO  
DECLARATION AND AGENDA 21 IN WHICH THE GLOBAL COMMUNITY  
AGREED TO FUNDAMENTAL PRINCIPLES SUCH AS THE**

PRECAUTIONARY PRINCIPLE, THE NON-TRANSFERENCE OF HARMFUL SUBSTANCES OR ACTIVITIES AND THE REQUIREMENT OF A FULL LIFE CYCLE ANALYSIS OF SUBSTANCES AND ACTIVITIES.

4. STANDARDS-RELATED MEASURES

Discrepancy between "shall work jointly to enhance" and "shall to the greatest extent practicable make compatible" in the NAFTA, and "forbids downward harmonization," "mandate upward harmonization" in the Canadian government's interpretation of NAFTA

Article 906 Compatibility and Equivalence

1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the Parties shall, in accordance with this Chapter, work jointly to enhance the level of safety and of protection of human, animal and plant life and health, the environment and consumers.

Note "legitimate objectives" have been defined in article 9.5 as

- a) safety
- b) protection of human, animal or plant life or health, the environment or consumers
- c) sustainable development

ARTICLE 906 Compatibility and Equivalence

2. Without reducing the level of safety or of protection of human, animal or plant life or health, the environment or consumers, without prejudice to the rights of any Party under this Chapter, and taking into account international standardization activities, the Parties shall to the greatest extent practical, make compatible their respective standards-related measures

In the Canadian Government publication "Canadian Environmental Review" it is stated:

Standards enhancement

NAFTA would do more than forbid downward harmonization it obligates Parties to work towards upward harmonization (CER, 19)

Environmental objectives addressed during the negotiations included...co-operation, on a continental basis, on the enhancement of environmental standards and their enforcement (Intro, CER)

Significant as it would in effect establish the highest current standards of the three parties (CER, 19)

ACTION: to call upon the Canadian government to have incorporated in the NAFTA the "forbidding of downward

harmonization" and the "obligating to work towards upward harmonization"

## 5. ALLOCATION OF BURDEN IN RELATION TO STANDARDS

Discrepancy between burden of establishing inconsistency within a chapter as indicated in NAFTA and The placement of the burden of proof in the whole document on the nation challenging an environmental standard of another country as indicated in the Canadian interpretation of the document.

Article 914 Technical consultations

4. The Parties confirm that a Party asserting that a standards-related measure of another Party is inconsistent with this Chapter shall have the burden of establishing the inconsistency

The Canadian Government in its Canadian Environmental Review stated:

Environmental objectives addressed during the negotiations included...placement of the burden of proof in a dispute on any nation challenging an environmental standard of another country. (Intro, CER)

and reaffirmed in the body of the text

"Furthermore, should Canada adopt an environmental standard under these international agreement, the burden of proof would be with any country challenging the provision (CER, 14)

It is only on page 22 that the actual text is presented

ACTION: TO ENSURE THAT IN ANY DOCUMENT RELATED TO THE ENVIRONMENT, THE BURDEN OF PROOF SHOULD LIE NOT ONLY ON THE COUNTRY THAT OBJECTS TO THE HIGHER STANDARD, BUT ALSO TO THE INDUSTRY THAT SEEKS TO INTRUDE INTO THE ECOLOGICAL COMMONS

## 6. RELATION BETWEEN ACTION OF ENVIRONMENTAL MEASURES AND INVESTMENT

The discrepancy between "recognizing inappropriateness" **should not waive** "**may request consultations**" as indicated in the NAFTA and "a commitment to refrain" in the Canadian government's analysis of the document

In the NAFTA Article 1114 (2) discourages the relaxing of environmental measures

In Article 1114 (2), Environmental Measures, the NAFTA states: The Parties recognize that it is **inappropriate to encourage** investment by relaxing domestic health, safety or environmental measures. Accordingly, a **Party should not waive** or otherwise derogate from, or offer to waive or otherwise derogate from,

such measures as an encouragement for the establishment, acquisition, expansion or retention in its territory of an investment of an investor. If a Party considers that another Party has offered such an encouragement, it **may request consultations** with the other Party and the two Parties shall consult with a view to avoiding any such encouragement

In the Intro of the Canadian Governments, "Canadian Environment Review", the environmental objectives is presented as being "a commitment to refrain"

Environmental objectives addressed during the negotiations included acceptance of a commitment that government refrain from offering derogations from generally applicable environmental measures for the purpose of encouraging an investment

**ACTION : CALL UPON THE CANADIAN GOVERNMENT TO DEMONSTRATE TRUE COMMITMENT BY CHANGING "SHOULD" TO "SHALL"**

Because of all these potential discrepancies between the NAFTA and the Canadian Governments interpretation of NAFTA, I would like to make the following recommendation

**RECOMMENDATION:**

**GIVEN:**

**EITHER THE GOVERNMENT OF CANADA HAS MISINTERPRETED OR MISREPRESENTED ENVIRONMENTAL SECTIONS IN NAFTA, IN THEIR OCTOBER, 1992 ENVIRONMENTAL REVIEW, OR THE NAFTA HAS CHANGED AND IN THAT CASE IT WOULD BE NECESSARY TO HAVE ANOTHER ENVIRONMENTAL ASSESSMENT REVIEW OF THE ENVIRONMENTAL IMPLICATIONS OF NAFTA**

**THE CANADIAN GOVERNMENT NOT RATIFY THE DOCUMENT UNTIL THE STRONGER INTERPRETATION THAT HAS BEEN PRESENTED TO THE CANADIAN PUBLIC THROUGH THE GOVERNMENT INTERPRETATION OF THE DOCUMENT BECOME AN INTEGRAL PART OF THE ACTUAL DOCUMENT**

**THE CANADIAN GOVERNMENT NOT RATIFY THE DOCUMENT BECAUSE IT FALLS SHORT OF THE CANADIAN GOVERNMENT'S INTERPRETATION OF THE DOCUMENT.**

## RESOLUTION

GIVEN THAT THE TWO OF THE HEADS OF STATE THAT NEGOTIATED THE NAFTA ARE NO LONGER IN POWER,  
GIVEN THAT THERE WILL BE AN ELECTION IN MEXICO IN JULY 1994

AND GIVEN THAT THE NAFTA HAS NOT BEEN AVAILABLE FOR FULL PUBLIC SCRUTINY PRIOR TO NEGOTIATION

GIVEN THAT THE NAFTA HAS BEEN MISREPRESENTED TO THE PUBLIC BY THE CANADIAN GOVERNMENT

BE IT RESOLVED THAT THE CURRENT NAFTA BE DISCARDED, AND THAT AN AGREEMENT THAT TAKES INTO CONSIDERATION THE FOLLOWING CONCERNS

In all three countries, Canada, Mexico and the U.S., citizens and organizations are concerned about

- the misplacing of government priorities,
- the delusion of public process,
- the exploitation of the labour force,
- the inequitable distribution of resources,
- the disenfranchisement of the many,
- the violation of human rights and
- the denigration of social justice

In all three countries, citizens and organizations are also concerned about the unquestioned imperative to grow,

- the over-consumptive pattern of behavior,
- the relentless destruction of the environment, and
- the irreversible loss of ecological heritage

THIS NEW AGREEMENT SHOULD NOT BE FULLY RATIFIED BY ANY OF THE THREE COUNTRIES UNTIL AFTER THE ELECTION IN MEXICO AND UNTIL THE AGREEMENT HAS THE SUPPORT OF THE CONCERNED CITIZENS IN ALL THREE COUNTRIES (see diagram B.)

ANNEX: **Re Water**

**As to the risk of Canada being forced to export water to the U.S. (Water not being covered in the agreement), Political promises to the contrary are not enough. Once the free trade deal comes into effect, and in the absence of legislation forbidding it, Canada will be in a poor bargaining position against U.S pressure to divert water the most recent pressure being for diversion from the Great Lakes into the drought-stricken Mississippi basin**

**In all the on-going bargaining implicit in the Free Trade Agreement, Canada throughout will be the weaker party at the**

**negotiating table. Our lack of success on the acid rain issue is indicative of that (Margorie Bowker)**

**goods of a Party** means domestic products as these are understood in the *General Agreement on Tariffs and Trade* or such goods as the Parties may agree, and includes originating goods of that Party;

4. establishment of levels of protection in pursuing its legitimate objectives  
Discrepancy between  
(Article 904,1)

1. Each Party may, in accordance with this Agreement, adopt, maintain or apply any standards-related measure, including any such measure relating to safety, the protection of human, animal or plant life or health, the environment or consumers, and any measure to ensure its enforcement or implementation.

"Right to Establish Level of Protection" (Article 904,2)

Notwithstanding any other provision of this Chapter, each Party may, in pursuing its legitimate objectives of safety or the protection of human, animal or plant life or health, the environment or consumers, establish the levels of protection that it considers appropriate in accordance with Article 907 (2)

Both the "non-discriminatory Treatment" and "Unnecessary Obstacles" appear to qualify a state's right to high standards

"non-discriminatory Treatment" (Article 904, 3)

Treatment no less favourable than that it accords to like goods, or in like circumstances to service providers, of any other country.

"Unnecessary Obstacles" (Article 904, 4)

No party may prepare, adopt maintain or apply any standards-related measure with a view to or with the effect of creating an unnecessary obstacle to trade between the Parties. An unnecessary obstacle to trade Shall not be deemed to be created where:

- a. the demonstrable purpose of the measure is to achieve a legitimate objective; and
- b) the measure does not operate to exclude goods of another Party that meet that legitimate objective.

Another constraint could be "disguised restrictions" (Article 712)

"No party may adopt, maintain or apply any sanitary or phytosanitary measure with a view to, or with the effect of, creating a disguised restriction on trade between the Parties.

**PROBLEM 2 That there is a provision for respecting international standards, but UNCED failed to establish international environmental standards. International principles were in place**

1. Each Party shall use, as a basis for its standards-related measures, relevant international standards or international standards whose completion is imminent, except where such standards would be an ineffective or inappropriate means to fulfil its legitimate objectives, for example because of fundamental climatic, geographical, technological or infrastructural factors, scientific justification or the level of protection that the Party considers appropriate. (article 905, Use of international standards)

In the section on Compatibility and equivalence

"1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the Parties shall, in accordance with this Chapter, work jointly to enhance the level of safety and protection of human, animal and plant life and health, the environment and consumers.

2. Without reducing the level of safety or of protection of human, animal or plant life or health, the environment or consumers, without prejudice to the right of any Party under this Chapter, and taking into account international standardizations activities, the parties shall, to the greatest extent practicable, make compatible their respective standards-related measures so as to facilitate trade in a good or service between the parties.

Note that International standard is defined as "a standards-related measure, or other guide or recommendation, adopted by an international standardizing body and made available to the public, and "international standardizing body" is defined as

a standardizing body whose membership is open to the relevant bodies of at least all the parties to the GATT, including the International Organization for Standardization (ISO), the international electrotechnical Commission (IEC), Codex Alimentarius Commission, WHO, FAO, ITU International Telecommunication Union (ITU); or any other body that the Parties designate;

ACTION: to advocate the inclusion of bodies that have embodied environmental provisions; UNEP, IUCN

**PROBLEM 3: HARMONIZING OF STANDARDS TO LOWEST COMMON DENOMINATOR**

Article 713: International Standards and Standardizing Organizations

1. Without reducing the level of protection of human, animal or plant life or health, each Party shall use, as a basis for its sanitary and phytosanitary measures, relevant international standards, guidelines or recommendations with the objective,

among others, of making its sanitary and phytosanitary measures equivalent or, where appropriate, identical to those of the other Parties.

[does this mean never below international standards?]

2. The balance between environmental provisions and "notwithstanding" or "provided that" concepts such as legitimate objectives.... , providing ...

Provision for urgency ....

provision for exclusion

provision for harmonization without reducing....

Non-discriminatory treatment

not providing and unnecessary obstacle to trade

Measures that are applied in an unjustifiable manner

Measures that constitute a disguised risk

measures applied in an arbitrary way

providing measures are consistent with Chapter

3. The balance between impact assessment to prevent a project from proceeding and impact assessment to determine how to mitigate the impact

"A. Environmental review process and method

Since 1990, the federal government has required that all new policy or program initiatives having potentially significant environmental implications undergo an environmental review. The environmental review process can be used to develop an understanding of the general nature of the possible environmental effects of a policy, and to provide a framework for addressing environmental concerns that could arise when subsequent decisions are being taken relative to the implementation of the policy. (CEA, 69)

similarly the Mexican government indicates

"The Mexican government has attached priority to key public and private activities that are the most likely to cause ecological imbalances or to exceed the limits established in the Law, its regulations and ecological standards. The government has imposed regulations on the evaluation of the environmental impact of a broad range of public and private activities and has made them subject to prior authorization. Based upon an environmental review, the appropriate federal, state, or municipal government authority must authorize and impose conditions on both public and private activities that may cause adverse ecological effects or violate environmental laws. (CEA, 89)

4. The balance between environmental enhancement and not recognizing extraterritoriality

Extraterritoriality occurs when one country unilaterally attempts to extend, directly or indirectly, its policies into the jurisdiction of another country.

Extraterritoriality was not advocated by the negotiators of Canada (nor by the ENGO— those involved in the consultative process)

For example the USA has no right to try to imposed their standards on the Victorians who continue to dump raw sewage into the ocean, or on the Logging companies that continue to clear cut Canadian forests and Canada has no right to try to impose its higher pesticide residue standards on the USA

5. The balance between impact assessment and absolute prohibition (no acceptable residue )

6. The balance between the reliance on international standards but the reluctance to list any other agreements than those ratified by the USA

The USA has been notorious for not signing international agreements

United Nations Convention on the Protection and preservation of Cultural and Natural heritage

positive duty to identify areas of significant natural heritage

3.

1.Extraterritoriality harmonization of standards

Discussion of document:

The preamble is very strong. To a certain extent, it would appear that environment has primacy over employment: the preamble reads,

"Create new employment opportunities and improve working conditions and living standards in their respective territories; and this is qualified by the statement " undertake each of the preceding in a manner consistent with environmental protection and conservation:

YET

Without a commitment to achieve an enforceable means to attain a limit to growth, and without a commitment to set up an infrastructure to enforce regulations; the current North American situation which is now urgent will become irreversible.

The preamble also calls for "the development and enforcement of environmental laws and regulations;

**(Note discussion with John Fried about legal implications)**

**PROBLEM 1.**

**A state cannot establish a higher environmental standard of production and exclude goods that do not meet that standard of production, and cannot require the other states to live up to higher standards**

The following two sections appear to permit each state to establish as high standards as they deem necessary:

"Right to take Standards-related Measures"

Article 906 Compatibility and Equivalence

1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the Parties shall, in accordance with this Chapter, work jointly to enhance the level of safety and of protection of human, animal and p

(Article 904,1)

1. Each Party may, in accordance with this Agreement, adopt, maintain or apply any standards-related measure, including any such measure relating to safety, the protection of human, animal or plant life or health, the environment or consumers, and any measure to ensure its enforcement or implementation.

"Right to Establish Level of Protection" (Article 904,2)

Notwithstanding any other provision of this Chapter, each Party may, in pursuing its legitimate objectives of safety or the protection of human, animal or plant life or health, the environment or consumers, establish the levels of protection that it considers appropriate in accordance with Article 907 (2)

Both the "non-discriminatory Treatment" and "Unnecessary Obstacles" appear to qualify a state's right to high standards

"non-discriminatory Treatment" (Article 904, 3)

Treatment no less favourable than that it accords to like goods, or in like circumstances to service providers, of any other country.

"Unnecessary Obstacles" (Article 904, 4)

No party may prepare, adopt maintain or apply any standards-related measure with a view to or with the effect of creating an unnecessary obstacle to trade between the Parties. An unnecessary obstacle to trade Shall not be deemed to be created where:

- a. the demonstrable purpose of the measure is to achieve a legitimate objective; and
- b) the measure does not operate to exclude goods of another Party that meet that legitimate objective.

Another constraint could be "disguised restrictions" (Article 712)

"No party may adopt, maintain or apply any sanitary or phytosanitary measure with a view to, or with the effect of, creating a disguised restriction on trade between the Parties.

**PROBLEM 2 That there is a provision for respecting international standards, but UNCED failed to establish international environmental standards. International principles were in place**

1. "Each Party shall use, as a basis for its standards-related measures, relevant international standards or international standards whose completion is imminent, except where such standards would be an ineffective or inappropriate means to fulfil its legitimate objectives, for example because of fundamental climatic, geographical, technological or infrastructural factors, scientific justification or the level of protection that the Party considers appropriate." (article 905, Use of international standards)

In the section on Compatibility and equivalence

"1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the Parties shall, in accordance with this Chapter, work jointly to enhance the level of safety and protection of human, animal and plant life and health, the environment and consumers.

2. Without reducing the level of safety or of protection of human, animal or plant life or health, the environment or consumers, without prejudice to the right of any Party under this Chapter, and taking into account international standardization activities, the parties shall, to the greatest extent practicable, make compatible their respective standards-related measures so as to facilitate trade in a good or service between the parties.

Note that International standard is defined as "a standards-related measure, or other guide or recommendation, adopted by an international standardizing body and made available to the public, and "international standardizing body" is defined as

a standardizing body whose membership is open to the relevant bodies of at least all the parties to the GATT, including the International Organization for Standardization (ISO), the international electrotechnical Commission (IEC), Codex Alimentarius Commission, WHO, FAO, ITU International Telecommunication Union (ITU); or any other body that the Parties designate;

ACTION: to advocate the inclusion of bodies that have embodied environmental provisions; UNEP, IUCN

### **PROBLEM 3: HARMONIZING OF STANDARDS TO LOWEST COMMON DENOMINATOR**

Article 713: International Standards and Standardizing Organizations

1. Without reducing the level of protection of human, animal or plant life or health, each Party shall use, as a basis for its sanitary and phytosanitary measures, relevant international standards, guidelines or recommendations with the objective, among others, of making its sanitary and phytosanitary measures equivalent or, where appropriate, identical to those of the other Parties.

[does this mean never below international standards?]

**PROBLEM 4: LIMITED REFERENCE TO INTERNATIONAL DOCUMENTS ON THE ENVIRONMENT ( NOTE NO MENTION OF RIO- unless in Annex 104, check in Annex 104); Note only reference is to "specific trade obligations" in the environment treaties:**

**[ACTION; TO OPEN UP NAFTA TO ENSURE THAT THE DOCUMENT IS COMPATIBLE WITH UNCED DOCUMENTS]**

**Treaties mentioned:**

- convention on International Trade in endangered Species of Wild Fauna and Flora ( 1973)
- the Montreal Protocol (1990)
- Basel convention on the Control of trans-boundary Movement of Hazardous Wastes and their disposal (1989)
- Annex 104-1 Bilateral and Other Environmental and conservation Agreements
  1. The agreement between the Government of Canada and the Government of the U.S. concerning the trans-boundary Movement of Hazardous Waste, signed at Ottawa, October 18, 1986
  2. The agreement between the U.S and Mexico on cooperation for the Protection and improvement of the Environment in the Border Area, 1983.

**\* see Annex 104-1 for other agreements**

Such obligations shall prevail to the extent of the inconsistency, provided that where a Party has a choice among equally effective and reasonably available means of complying with such obligations, the party chooses the alternative that is the least inconsistent with the other provisions of this Agreement.

**ACTION: note that there is the provision to add other environmental agreements.**

The parties may agree in writing to modify Annex 104.1 include any amendment to an agreement referred to in Paragraph 1 and any other environmental or conservation agreement.

**PROBLEM 5: PRIMACY IS GIVEN TO NAFTA OVER OTHER INTERNATIONAL AGREEMENTS**

NOTE: THAT IN ARTICLE 103, "Relation to Other Agreements, this agreement is given primacy

1. the Parties affirm their existing rights and obligations with respect to each other under the GATT and other agreements to which such Parties are party.
2. In the event of any inconsistency between this Agreement and such other agreement, this Agreement shall prevail to the

extent of the inconsistency, except as otherwise provided in this Agreement.

Background:  
NAFTA

## Perspectives and Actions

### DEPARTMENTS

#### 1. External Affairs

Documents:

North American Free Trade Agreement Implementation Act: The NAFTA Partnership. March 1993

Content:

It is primarily a document about Canadian Business interests

"NAFTA will provide further new opportunities for Canadian goods and services. Canadian firms will be able to expand sales in sectors that were previously highly restricted, such as autos, financial services, trucking, energy and fisheries. "

Mexico Canada's largest trading partner ( 3 billion, 1991)

"Canadian business has already begun to take advantage of these new trade measures to increase their presence in Mexico. "

Participants:

The Export Development Corporation (EDC)

The Business Co-operation Program of the CIDA

CIDA/Inc (several environmental protection and control projects related to air and water pollution, hazardous waste disposal and rehabilitation of wetlands in proximity to industrial and residential areas.)

Investment Canada is also developing a program to encourage Mexican investment in Canada

EAITC has organized a trade promotion program in Mexico directed at specific sectoral opportunities, to introduce as wide a cross section as possible of potential exporters to the marketplace.

In order to capitalize on existing opportunities in Mexico and give depth to heightened economic relations as envisaged under the NAFTA, the Canadian private sector is preparing to position itself effectively in this growing market.

The most likely sectors of concentration for Canadian entrepreneurs are mining, agro-industry, food, transportation, environment and tourism development.

Successful Canadian exporters

SR Telecom, Du Pont, Canada Export Award Winner in 1992,

Dare Foods, Cansec Systems, Royal Plastics, Garden Grove Produce, Rebound Rig international oil equipment (900,000);

Bovar-Western research (1.5. M) instrumentation control of their sulphur recovery units

Chronology:

Note: March 18. (1992). Canada provides Mexico with 1\$ million worth of environmental assistance. [what was the nature of the assistance]

September 17 (1992) Washington, D.C. — Environment ministers of the NAFTA countries agree to establish a Trilateral Environmental commission to explore co-operation on environmental issues.

November 3, 1993 the Canadian Environmental review of the NAFTA is released.

**But will these pronouncements be enough to ensure long term preservation and protection of the environment without the concomitant political will?**

**Would those provisions prevent the government from waiving sections of the Federal fisheries Act , and bypassing the Environmental Assessment Review Process to allow Alcan to proceed with the Kemano II Project**

But would those provisions prevent Governments that are against in principle the mining of Uranium to acquiesce to the uranium miners and permit uranium mining

But would those provisions prevent the disposal of nuclear wastes on the land of disenfranchised- the indigenous peoples of the US

But would those provisions prevent the destruction of significant ecosystems

But would those provisions prevent the transfer of chemicals that are deemed to be unsafe in one country to another country with less stringent regulations.

Throughout the document there is a mention of "standards"

Regardless of NAFTA there are serious systemic constraints preventing significant change in addressing the seriousness of the current environmental crisis in North America

Some constraints are

i. The reluctance of the political and industrial community to address the need to limit growth and over consumption and the concomitant reluctance to acknowledge the implications of ignoring the limiting of growth and over-consumption.

***In the process of wrapping the semantic capsule 'sustainable development' around this potentially unpalatable two sided world-view was born the genteel ploy of emphasizing the growth imperative for consumption in the South and the industrial communities comfortable with "business (much) as usual", while focusing on sustainability for purposes of dealing with the increasingly***

***strident and influential concerns of environmental movements and scientific bodies documenting the possible dangers of global change. Thus there remains latent much of the old Stockholm debate between environmentalists and industrialist in the North and between developed nations of the North and developing nations of the south. (Dobell, 1992, p. 4)***

Since our economies are growing and the ecosystems within which they are embedded are not, the consumption of resources everywhere has begun to exceed sustainable rates of biological production. Seen in this light, much of today's wealth is illusion derived from the irreversible conversion of productive natural capital into perishable human-made capital. (Rees, 1991, Draft. p. 9)

The result of unchecked growth has been the following:

“Encroaching deserts (6 million ha/year; deforestation (11 million ha/yr of tropical forests alone); acid precipitation and forest dieback (31 million ha damaged in Europe alone); soil oxidation and erosion ( 26 billion tonnes/yr in excess of formation; toxic contamination of food supplies; draw-down and pollution of water tables; species extinction (1000s/yr); fisheries exhaustion; ozone depletion (5% loss over North America [an probably globally] in the decade to 1990); greenhouse gas buildup (25% increase in atmospheric CO<sub>2</sub> alone); potential climatic change ( 1.5-4.5C<sup>0</sup> mean global warming expected by 2040); and rising sea-levels (1.2-2.2 m by 2100) and like trends are the result of either excess consumption or the thermodynamic dissipation of toxic by-products of economic activity into the ecosphere ” ( Data from: Brown et al [Annual]; Brown and Flavin 1988; Canada 1988; WCRP 1990; Schneider 1990; US Environmental Protection Agency [reported in Stevens 1991]). ( reported in Rees, 1991, Draft. p. 11)

“...development [and growth has even been perceived as a basic truth by the president of the World Bank: Barber Conabb CHECK SPELLING. stated that " a basic truth is that development cannot be halted, only directed". (Conabb, 1989, p. 15)

and he then continued to reassure the developing nations that

"With the developing nations, we must go on learning by doing..."(Connabb, 1989, p. 15)

ii. The discrepancy between the establishment of environmental policy through international commitments and the denial of the policy through free trade agreements:

In June 1988 both the US and Canada participated actively in a world conference on The Changing Atmosphere: Implications for

Global Security. The conference concluded that global atmospheric problems were the product of 'an unintended, uncontrolled, globally pervasive experiment whose ultimate consequences could be second only to a global nuclear war.' and recommended national efforts to reduce carbon emissions by 20 % by the year 2005. .... yet later that year the Canada-US Free trade Agreement was ratified, entrenching energy and resource policies that are fundamentally at odds with the policy directions endorsed by representatives of the countries at the global warming conference. Under the terms of the free trade agreement; both countries forego, for as long as the agreement stands, "the use of regulatory devices that could prevent the development of fossil fuel resources for export." (Shrybman, S. 1990, p. 22)

iii. The discrepancy between government and industry rhetoric embodied in laws and regulations and the political will to enforce these regulations

iv. The discrepancy between institutional rhetoric embodied in publications and the traditional role that is played by the institution ( the usurping of the environmental movement to the point of making it redundant) (see "eco-development" in Colby, M., Environmental management in development; the evolution of paradigms, 1990, World Bank discussion papers V. 39)

v. The advocating of a new found role of international governance for industry as a potential replacement for government. Ramphal at Globe 92 described the new found role as " enlightened long-term thinking": He described the newly found enlightenment in the following way:

"The private sector has been traditionally regarded as trammled by short-term profit considerations. Enlightened long-term thinking was a preserve of the State, of governments. Today the greatest flaw in governance at the national level is the ascendancy of the short-term in the political calculus, as leaders respond frenetically to democratic pressures for immediate results. It is the private sector, and particularly the larger enterprises within it, that have the intellectual space to think beyond tomorrow..." ( Ramphal, S. 1992)

vi. The advocating of self regulation by industry; the moving away from compliance, imposed regulations etc.

#### QUOTE FROM SESSION AT GLOBE 92

vii. The discarding of the principle of arms-length research in industrial projects

viii. The revealing of the true intent by industry in in-house documents.????  
from statements from industry about industry's perceived advantages of  
tripartite free trade.

McCrae, Jim World Bank Environmental division  
"dirty technology belongs in third world"  
Basel convention related to third world dumping

The Royal Bank conveys in Econoscope, that " the new rules [in Mexico] automatically allow 100% foreign ownership of Mexican companies provides that less than US100 million is involved and that certain other criteria are met ( for example, the funds must come from abroad and the investment must not be in areas which are already industrialized)Royal Bank of Canada p 4.

Note: no mention of safe industry

The move towards a free trade agreement with the United States is seen by the Mexican government as a powerful tool to modernize its economy. Such an alliance leading to a greater integration of Mexico into the North American economy could provide an anchor of stability for Mexico's monetary and fiscal policies. (Royal Bank of Canada p. 4)

...On the plus side, the United States will find that an improved Mexican economy, particularly if it can help to reduce the flow of economic refugees into the United States, and improved co-operation on narcotics and the environment sufficiently compelling reasons to pursue free trade talks. The greater competition offered by Mexican low-cost labor-intensive products had to be kept in perspective. A central tenet of international trade theory is that countries specialize in the production and export of goods according to comparative advantage rather than absolute advantage.

Man developing countries have failed to convert their advantages with respect to plentiful and cheap labour into a comparative advantage because of a number of factors impeding overall labour productivity. (Royal Bank of Canada p. 9)

...For Mexico the comparative advantage offered by low-cost labour is offset to a certain extent by the lower level of manufacturing productivity except perhaps for the most recent manufacturing plants built in the in-bond maquiladora sector). Moreover, Mexico is faced with a number of other problems such as heavy state involvement, absenteeism and poor transportation and communication infrastructures." ( Royal Bank of Canada p. 11)

NOTE mention of pollution controls

There are several areas in which Canadian expertise could find a market in Mexico. These include agriculture, fishing , forestry and pollution control . Royal Bank of Canada p. 11

[Note the only mention of anything that is related to the environment is the possibility of a market for Canadians in pollution control. ]

On the issue of whether or not ' export protectionism' would grow, one must ask what the multinational corporations want to use the spoke countries for. Do they want them as markets or as production bases? If they want them as export markets, the ;multinationals would then favor export protections. If, however, they want them as production bases--as is increasingly the case with Mexico--then the multinationals gain no advantage from maintaining export protections." ( Weintraub, Sidney, in Hill, R. et al 1991, p. 9)

"...the multinational might well prefer an expanding free trade area to rationalize their production. ...U.S. multinationals have distribution systems set up to take advantage of the preferences it provides; they may well want it to continue." (Wonacott, R.in Hill, R. et al 1991 p. 9)

"First, it sets a timetable that lends itself to the 'Yankee trader' attitude that you cannot conclude a deal until the deadline (indeed after the deadline), because if a deal is reached earlier, it is because you have not squeezed enough and ended up leaving ;money on the table. Mexican negotiators have not experienced this, but they soon will...Second, the fast-track process lends itself to some very damaging side deals between the administration and Congress. In the Canadian case, while approval was given for the process by Congress, the price was a side deal whereby the administration essentially promised to restrict the Canadian forest products industry in any way it could. It did so with trumped-up cases against cedar shakes and shingles and softwood lumber." ( Ritchie in Hill, R. et al 1991, p. 11)

#### To increase Canada's Weight in Settling Trade Disputes

"A trilateral resolution of disputes would provide Canada and Mexico together with greater weight in holding the United States to its commitments than either would have alone. But for precisely this reason, it is far from clear that the United States would accept the trilateralizing of dispute settlement. ...Nor is it even clear that Canada would wish to trilateralize dispute settlement, since this could weaken, rather than strengthen, Canada's voice in disputes with the United States where Mexico did not support Canada's position." (Wonnacotte, R.J. "Canada and the U.S. - Mexico Free Trade Negotiations." Commentary. No.21, September 1990. C.D Howe Institute p. 3)

#### To Have a Low-Wage Partner in the Free Trade Bloc

" Finally, Canada, like the United States, needs a low-wage partner such as Mexico. Every other participating country in a

free-trade bloc has such a partner. Without access to a pool of low-wage labor, Canadian industry will find it more difficult to remain competitive in world markets. However, low wages in Mexico will raise the question: How can Canadian industry compete with cheap Mexican labor? .Wonnacotte, R.J. "Canada and the U.S. - Mexico Free Trade Negotiations." Commentary. No.21, September 1990. C.D Howe Institute. p. 4

#### Fear of trade with low-wage Mexico

"One major fear will be that Canadians cannot risk trading freely with Mexico because of that country's cheap supplies of labour, which will give Mexican goods an overwhelming competitive advantage. ....If we really had to worry about the competitive advantage conferred by low Mexican wages, then existing Canadian tariffs would provide little relief: if 'sixty-cent-an-hour wages' are a threat, then 'sixty-six cent-an-hour wages' are not much less of a threat. .... What matters in international competition is ;not how ;much local labor is paid in terms of purchasing power. What matters is how unit costs of production compare internationally at the going exchange rates. (Lipsey, R. "Canada at the U.S. -Mexico Free Trade Dance." Commentary. No.20, August 1990. C.D Howe Institute p. 10).

ix. The watering down of environmental resolve when action is require: policy to prevent pollution becomes translated in action to reduce or mitigate pollution

12. The Ministers agreed that, in order to achieve ESID, industry initiatives should include the following objectives:

a) "Adoption of pollution prevention, the approach that prevents pollution at the source in products and manufacturing processes rather than removing it after it has been created" ( UNIDO, 1992, p. 7)

In the introduction to the Alumina Industry case study that was examined at the UNIDO conference the following statement was made: "Bauxite mining cause unavoidable ecological disturbance, and in some circumstances the issue of preservation of biodiversity is important" (UNIDO, Proceedings, 1992, p. 220)

#### Recommendations

"7. Industry experts summarized the most promising ways of reducing the negative environmental impact of the alumina industry at the plant level as follows:

What was a policy of "preventing pollution" has now become a mandate to "reduce pollution or mitigate pollution"

"the thrust of the world Bank's energy work is increasingly to promote development in the energy sectors of developing countries while taking prudent steps to mitigate damage to the environment" (the World Bank, 1989)

x. The compromising of the environment as a result of trade agreements

It [NAFTA] may limit Canada's or British Columbia's authority to establish relatively tough environmental standards; and it may limit the public's access to decision-making affecting the environment during the negotiation of an agreement and the operation of such an agreement.

therefore, the association urged the government of British Columbia to:

- undertake an environmental assessment ( with full opportunity for public access to information and involvement) of the potential impact on British Columbia's environment and environmental decision-making process
- insist that the federal government do the same; and
- oppose any trade agreement with Mexico that:
  - i) would impair the province's ability to set relatively high environmental standards;
  - ii) does not specify that failure to establish and enforce reasonable environmental standards is considered to be a trade subsidy; or
  - iii) does not include mechanisms to facilitate public access to information regarding and public participation in, decision-making under the agreement"

( Environmental Law Association , Ministry of Development, Trade and Tourism,1991 p. 23)

Within Canada, United States and Mexico there are laws, policies, and regulations in place which appear to preserve and protect the environment; yet industry is continually in non-compliance with these environmental provisions and government is continually violating its own policies by not enforcing regulations. Without a commitment to achieve and enforceable means to attain a limit to growth, and without a commitment to set up an infrastructure to enforce regulations; the current North American situation which is now urgent will become irreversible.

## 2. POSSIBILITY OF COMMON CONCERNS BEING ADDRESSED WITHIN AND THROUGH NAFTA

Does NAFTA become the [further] realization of these dire predictions or an opportunity for significant change? Is it possible to summon up the political will to limit growth, to achieve respect for human rights, to attain social justice, to enshrine ecological rights and to entrench fair and ecologically sound employment?

### BETTER QUOTES

"We need to do a lot more than admit there is a problem (Aridis, 1992)

"All measures taken so far are band aid solutions ... we need real solutions" (Carbajal, 1992 )

"Future economic growth will compound existing problems unless specific steps are taken to integrate free trade and environmental protection."

(Emerson, 1991)

[ and to limit growth]

" Human rights, labour rights and environment deserve equal treatment with trade rights" ( Axworthy , 1991,)

For at least twenty years we have engaged in environmental rhetoric.

In June 1972 at the Stockholm convention on the Human Environment the following statement was made and principles enunciated:

To achieve this environmental goal will demand the acceptance of responsibility by citizens and communities and by enterprises and institutions at every level, all sharing equitably in common efforts. Individuals in all walks of life as well as organizations in many fields, by their values and the sum of their actions, will shape the world environment of the future. Local and national governments will bear the greater burden for large-scale environmental policy and action within their jurisdictions. states the common conviction that:

#### Principle 1

Man has the fundamental right to freedom, equality and adequate conditions of life, in an environment of a quality that permits a life of dignity and well-being and he bears a solemn responsibility to protect and improve the environment for present and future generations...

#### Principle 2:

The natural resources of the earth include the air, water, land, flora and fauna and especially representative samples of natural

ecosystems must be safeguarded for the benefit of present and future generations through careful planning or management, as appropriate

#### Principle 13

"In order to achieve a more rational management of resources and thus to improve the environment, States should adopt and integrated and coordinated approach to their development planning so as to ensure that development is compatible with the need to protect and improve the human environment for the benefit of their population. (Stockholm convention on the Human" Environment, June 1972)

Was this only rhetoric in 1972: empty words whose legacy of inaction we now have to face?

If we are to achieve significant change **{we must translate our rhetoric into realistic commitments to action within a trade agreement. }**

Now in June of 1992 we are entering into a new world agreement, the "Rio Declaration on Environment and Development" at UNCED, and in the near future into a trilateral trade agreement , NAFTA. Is there still just rhetoric or will there now be substantive action to support words.

The three countries negotiating the NAFTA all enunciate environmental objectives but will all three countries have the political will to ensure that there will be long term preservation and protection of the environment Mexico

" Social liberalism therefore purposes a State that promotes and encourages private initiative, but has the capability to firmly regulate economic activity and thus prevent the few from taking advantage of the many; a State that channels attention and resources towards meeting Mexicans' basic needs, is respectful of labor rights and union autonomy, and protects the environment." (Carlos Salinas de Gortari, Social Liberalism: Our Path, Mexico: On the Record. Vol. 1. No. 4 ( March 1992)  
...Observaciones: El esfuerzo di Gobierno en el combate a la contaminacion comprende acciones que abarcan a todos los sectores de la sociedad, las cuales han sido aplicadas con gran efectividad gracias al esfuerzo y al desarrollo de la conciencia ecologica de la poblacion con su conjunto. ( documentation sent by Consulat of Mexico, latest news from April 12 and April 13 related to the environment)

"The Government of Mexico's three year environmental plan for the border communities calls for a doubling of the number of inspectors from the Secretariat of Urban Development and Ecology (SEDUE) by January 1992. This represents a four-fold increase from 1989. "By January 1992, The SEDUE team of 200 qualified inspectors will be ensuring that industries in the border

communities adhere strictly to Mexico's environmental laws and regulations. Businesses that refuse or cannot comply will be subject to penalties, including having their operations shut down. Information and data systems are being upgraded and decentralized. These improvements will allow for closer monitoring of raw materials and dangerous wastes. Already, in the last three years almost 1 million tons of hazardous materials have been prohibited from entering Mexico.

Progress can already be seen in the "maquiladora" industries where compliance with regulations on operating licenses, on the declaration of the production of hazardous wastes and on the proper disposal of hazardous wastes has increased dramatically since 1989. All existing maquiladora plants must be entirely re-certified by 1992. All new investment must present environmental impact statements." ("Protecting the Environment Mexico's public works program for the Border Region," undated, and unsigned document )

"Mexico and the United States are committed to a cooperative program that will encourage sustained economic growth and environmental protection in both countries. President Bust and president Salinas believe that the two are complementary and must be pursued together." ( Free trade Negotiations with Mexico Environmental matters, p. 1 )

"Mexico has established a good basis for progress on environmental protection and conservation of natural resource. President Salinas has states that, while seeking to stimulate foreign investment, Mexico will not accept investments that have been rejected by the United States or Canada for environmental reasons." ( U.S. government publication] Free trade Negotiations with Mexico Environmental matters, p. 2 )

"In March 1988, Mexico enacted its General Law for Ecological Equilibrium and Environmental Protection. it is a comprehensive statute designed to ensure that there is an adequate legal basis for protecting the environment. Indeed, the law is based in large part on U.S. law and experience.

A central element of the 1988 law is the requirement for environmental impact assessments to be completed on all new investment projects, in both the public and private sectors. To ensure they comply with these requirements, many privately owned companies have already created special environmental offices to analyze the environmental impacts of proposed business activities" ( U.S. government publication] Free trade Negotiations with Mexico Environmental matters, p. 3) ARMS LENGTH RESEARCH

In 1990.. the Government [of Mexico] shut down all 24 Military industrial installation in the Mexico City area because of

potential environmental risks." ( Free trade negotiations with Mexico, Environmental matters, U.S. government publication]

“Convenio con las industrias en el valle de Mexico para combatir la contaminacion ambiental

Por su parte el jefe del Departamento del Distrito Federal, Manuel Camacho Solis, explico las medidas tomadas en el pacto con la industria, entre las que destacan las siguientes;

- establecer la verificación obligatoria de las emisiones industriales, principalmente de las partículas de monóxido de carbono, azufre, óxidos de nitrógeno, plomo, hidrosulfatos y compuestos orgánicos volátiles para lo cual en un plazo máximo de 18 meses, 220 empresas que consumen el 53% del total de combustibles en el valle de México deberán contar con equipos anticontaminantes

- se integra un programa de capacitación de inspectores, auditores y verificadores, así como operadores de calderas y equipos de combustión.

- Se crea un cuerpo especial de inspección y asesoría profesional en la materia, y que actualmente las partículas de origen industrial son las de mayor riesgo para la salud, pues contienen químicos inorgánicos y metales pesados y constituyen el 65% de las partículas tóxicas suspendidas en el aire.

- se otorgará asesoría y equipo tecnológico a la industria para que instale equipos anticontaminantes

- se desarrollarán políticas de energía ( ahorro, consumo racional, entre otras), además de que se controlarán y reformularán solventes de pintura

- Se cuenta con un billón de pesos para financiar el control de emisiones, cambiar procesos y descentralizar industrias. Es importante señalar que por primera vez en un programa de esta naturaleza intervienen siete bancos comerciales: Multibanco Mercantil de México, Banca Serfin, Banca Confía, Bancomer, Banco Internacional, Multibanco Comermex y Banco BCH, así como ocho arrendadoras.

*Note.* Need for sustained monitoring and implementation of regulations cannot only be implemented as a means to an end. Implementation of standards and regulations as a means to an end without the provisions in place to continue to impose, implement these regulations.. relax regulation

- SE continuarán actualizando y desarrollando normas cada vez más estrictas para la industria, hasta alcanzar reducciones en la emisión de partículas entre un 70 y 90%

...Observaciones: El esfuerzo del Gobierno en el combate a la contaminación comprende acciones que abarcan a todos los sectores de la sociedad, las cuales han sido aplicadas con gran

efectividad gracias al esfuerzo y al desarrollo de la conciencia ecológica de la población con su conjunto." (documentation sent by Consulat of Mexico, latest news from April 12 and April 13 related to the environment)

## Canada

Canada's Green plan for a healthy environment is a co-ordinated package of actions to help Canadians work together in partnership to achieve, within this decade, a healthy environment and a sound, prosperous economy.

Canada's Green Plan is second to none in its comprehensive approach to a full range of environmental challenges, funding, accountability and provision for public involvement," he [Mr. de Cotret] added.

Canada's Green Plan offers new policies, programs and standards to clean up, protect and enhance our land, water and air, our renewable resources, the Arctic, parks and wildlife, and to reduce waste generation and energy use. It also includes measures to maintain global environmental security, foster environmentally responsible decision-making and improve our emergency preparedness....

Canada's Green Plan is a major step forward of our country. It greatly expands, organizes and focuses our environmental activities. It is an optimistic document about the future of our environment," Mr. de Cotret said. (Government of Canada's release "Federal Government releases environmental green plan" December, 1990.)

## Goal

to ensure that citizens today and tomorrow have clean air, water and land essential to sustaining human health and the environment....p. 1 ....

Legislative, Regulatory and Market tools for change

## Goal

the balanced use of strong and effective environmental laws, with market-based approaches for environmental protection. p. 20

## INITIATIVES

- Over the next five years, strengthen federal inspection, information exchange and investigation programs to better enforce environmental regulations ....

In 1991, develop and adopt a comprehensive Code of Environmental Stewardship covering all areas of federal operations and activities. The Code will be complemented by a list of targets on issues ranging from waste generation to contaminated sites clean-up and emission standards, establishment of an office of Environmental Stewardship and measures to ensure that federal purchasing policies and practices integrate environmental considerations.

Implementation of the code will ensure that the activities and operations of the federal government meet or exceed the standards and practices it is recommending for others. ( p. 21) Government of Canada's release " Federal Government releases environmental green plan" December, 1990.)

"Whereas the Government of Canada in demonstrating national leadership should establish national environmental quality objectives, guidelines and codes of practice "( Canadian Environmental protection act, 1988)

"Whereas toxic substances, once introduced into the environment, cannot always be contained within geographic boundaries ( Canadian Environmental protection act, 1988) section 2. a Government of Canada shall... take both preventative and remedial measures in protecting the environment" ( Canadian Environmental protection act, 1988)

In the Department of the Environment Act, under the division of "Powers, duties and functions of the Minister , it is stated that "the duties of the Minister include providing for

a) the preservation and enhancement of the quality of the natural environment, including water, air and soil quality; and to

2(i) endeavor to protect the environment from the release of toxic substances". (Canadian Environmental Protection Act, 1988, C 22)

[" deleterious substance means:

a) any substance that, if added to any water would degrade or alter or form part of a process of degradation or alteration of the quality of that water so that it is rendered or is likely to be rendered deleterious to fish or fish habitat or to the use by man of fish that frequent that water

(Fisheries act, statutes of Canada 1976077, c35)

yet raw sewage is still dumped into the waters around Vancouver Island and fish have lesions ]

" whereas... no present activity should compromise activities... fulfill the needs of future generations ( CHECK WORDING IN C13)

## United States

"A NAFTA offers an historic opportunity to bring together the energies and talents of their great nations, already bound by strong ties of family, business and culture. Prime Minister Mulroney and president Salinas are both leaders of great vision. They believe as do I, that a NAFTA would enhance the well-being of our peoples. They are ready to move forward with us in this unprecedented enterprise. In seeking to expand our economic growth, I am committed to achieving a balance that recognizes the need to preserve the environment, protect worker safety, and facilitate adjustment. ... At my direction, Ambassador Hills and my Economic Policy Council have undertaken an intensive review of our NAFTA objectives and strategy to ensure thorough considerations of the economic, labor and environmental issues raised by you and your colleagues. ....

Based on my discussions with President Salinas, I am convinced that he is firmly committed to strengthened environmental protection, and that there is strong support for this objective among the Mexican people. Because economic growth can and should be supported by enhanced environmental protection, we will develop and implement an expanded program of environmental cooperation in parallel with the free trade talks. ...thus, our efforts toward economic integration will be complemented by expanded programs of cooperation of labour and the environment." (Letter from George Bush to Chairman Rostenkowski and Majority Leader Gephardt; similar letter sent to every member of Congress, May 1, 1991)

Mexico's commitment to environmental protection

- Mexico has no interest in becoming a pollution haven for U.S. companies.
- Mexico's comprehensive environmental law of 1988, which is based on U.S. law and experience, is a solid foundation for tackling its environmental problems.
- All new investments are being held to these higher legal standards and an environmental impact assessment is required to show how they will comply.
- Enforcement has in the past been a key problem, but Mexico's record has been improving dramatically. Since 1989, Mexico has ordered more than 980 temporary and 82 permanent shutdowns of industrial facilities for environmental violations; the budget of SEDUE" ( Mexico ' EPA) has increased almost eight-fold

Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991)

#### Environmental issues in the NAFTA

- Protection of Health and Safety: We will ensure that our right to safeguard the environment is preserved in the NAFTA ( YET NOTE US NOT PREPARED TO HAVE THAT ENSHRINED IN AN INTERNATIONAL CHARTER)

- we will maintain the right to exclude any products that do not meet our health or safety requirements and we will continue to enforce those requirements

- we will maintain our right to impose stringent pesticide, energy conservation, toxic waste, and health and safety standards

- we will maintain our right , consistent with other international obligations, to limit trade in products controlled by international treaties ( such as treaties on endangered species or protection of the ozone layer).

- Enhancement and Enforcement of Standards: we will seek a commitment to work together with Mexico to enhance environmental health and safety standards regarding produces and to promote their enforcement

- we will provide for full public and scientific scrutiny of any change to standards before they are implemented.

- we will provide for consultations on enhancing enforcement capability, inspection training, monitoring and verification ”( Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991)p.p. 4, 5)

Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991)

- we will consult on national environmental standards and regulations, and will provide an opportunity for the public to submit data on alleged non-compliance. (Response of the Administration to issues raised in connection with the negotiation of a north American Free trade agreement. May 1, 1991, p. 5)

The current global ecological crisis is urgent and a serious shift in perspective is necessary if the crisis is to be addressed. This shift in perspective must permeate all future considerations of trade and development related to the environment, health, human rights and social justice. This shift in perspective must move away from perceiving that states have "the sovereign right to exploit their resources pursuant to their own environmental and developmental policies [and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other states or of areas beyond the limits of national jurisdiction." (Principle 2 in the Rio Declaration on Environment and Development)] . This shift in perspective must move away from perceiving that states have " the right to development [being fulfilled ] so as to equitable meet developmental and environmental needs of present and future generations" ( Principle 3 in the Rio Declaration on Environment and Development). Through this new

perspective we must begin perceiving that the ecological preservation and protection must be given primacy and that an integral part of ecological preservation and protection is the limiting of industrial growth.

If states entering into the free-trade agreement acknowledge the need to limit growth and ecological preservation and protection as fundamental principles of negotiation, then any departure from this principle will have to be justified. The onus of proof would then shift from those objecting to increased growth and to potentially ecologically unsound interventions having to demonstrate harm to those advocating interventions having to demonstrate worth and safety.

Although all of the three countries do not recognize the need to limit growth they have spent years enunciating the goal of protecting and preserving the environment.

**What we need to do is achieve the highest attainable synthesis of our common goals in the coordination of policy in a North American community, not some lowest common denominator achieved through some process of mechanical compromise [ re - integrative bargaining]. [Need to achieve a bargaining set with sufficient diversity to be able to trade off objectives for one country in one area with goals for others in others. ]**

There is a need for common standards based not only on the highest tenable principles drawn from all three countries but also on the highest tenable principles not yet embodied in policy and legislation. These standards should be related to environmental, social justice, human rights and health provisions. The enshrining of high standards conforms in principle to declared objectives of all three countries. These declared objectives are present not only in legislation from all three countries but also in many international covenants and declarations to which all three countries to varying degrees subscribe [have ratified] . These declared objectives are evident in [ Out Common Security Palmer] in the preamble to C 13 Environmental Assessment Review Act in Canada, in the intent behind the Mexican Constitutional law for the ecological equilibrium and protection of the environment CHECK and in the U.S...

**So I am not here to wring hands about the threat posed by Mexico as a pollution haven in a North American community.** In fact, in many ways all of North America could be described as a pollution haven for industry. **Rather, on the assumption that we will, for political reasons, have a little time before a final agreement is reached, I want to ask how we can use this lull to translate some of our nice rhetoric into realistic commitments to action within a trade agreement.**

**On the issue of a North American Free Trade Agreement there has already accumulated a great deal of literature [ refs. Hart, CD Howe, Murray Smith, Conference volumes, etc., BC consultation [and commissioned ] documents, etc.]**

**On the more particular question of trade and environment, there is also beginning to accumulate a vast literature. The issue is being addressed by a GATT working party, and is a major topic for discussion at UNCED. Also a number of reports [IISD conference, GATT report,...]**

**But indications to date suggest that the discussions at UNCED will not resolve the basic tensions between environmental goals and economic principles [ecological rights and economic privileges]. The Draft text for the RIO Declaration [on the Environment and Development] reveals still far too strong an overhang of orientation to a model of the nation-state and national sovereignty** and a reluctance to curb growth or to come up with international environmental standards, with an international court of environmental law, with the enshrinement of the right to a safe environment and to an environmental heritage; and with establishing any form of international environmental governance

Even though the international scientific community that does not have a vested interest in development recognizes the urgency of the global situation (include reference to document signed by 20 Nobel Laureates see Fred Knelman's letter to Nobel Laureates) the U.N. delegates meeting in the Prep Com in New York have failed to give the environment primacy and have instead enshrined the right, though qualified, to develop and exploit resources.

In principle 2. "States have, in accordance with the Charter of the United Nations and the principles of international law, the sovereign right to exploit their own resources pursuant to their own environmental and developmental policies, and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other States or of areas beyond the limits of national jurisdiction." ( 2 April 1992, Rio Declaration on Environment and Development]

In principle 3.

The right to development must be fulfilled so as to equitably meet developmental and environmental needs of present and future generations ( 2 April 1992, Rio Declaration on Environment and Development]

The Prep Com delegates also failed to define explicitly what is meant by development: there is a fundamental distinction between exploitative and humanitarian development. Even the chair of committee on "Rio Declaration on Environment and Development" continued to perpetuate the simplistic myth that the north is concerned about [only] the environment and the south is concerned about [only] development. (March 26, 1992, personal communication in presence of the press). Are they continuing to ignore concerns as embodied in declarations such as those embodied in the "Constitutional Law for the Ecological Equilibrium and Protection of the Environment" Mexican document, 1988)

Not only have the delegates been reluctant to limit growth and to give the environment primacy within the sustainable development context they have

also failed to recognize the urgency of the global situation by their not recognizing more fundamental non-anthropocentric rights

Principle 1 human beings are at the centre of concerns for sustainable development. They are entitled to a healthy and productive life in harmony with nature.

( 2 April 1992, Rio Declaration on Environment and Development]

Other agreement such as GATT have succeeded in resolving the tension **between environmental goals and economic principles** [ecological rights and economic privileges] by giving primacy to **{unimpeded flows of goods and all) and ignoring environmental values (pursuit of a sustainable society through conservation of resources and preservation of biodiversity) }**

**GATT is built on the premise of nation states and meaningful national borders. Indeed the whole apparatus of international law has to presume that the relevant actors are national government.**

GATT fails to permit "power of governments to implement environmental regulation ..." and brings about "increased economic pressures to reduce environmental standards." (from FAX sent by West Coast Environmental Law Association with comments by Rolfe, C. Environmental considerations regarding a possible Mexico-Canada Free trade Agreement for the West Coast environmental law association, February, 1991).

Each one of the three states involved has attempted to object to other states of using high environmental standards to influence trade and in each case GATT has supported the state seeking to object to high standards:

"The Canadian pulp and paper industry has urged Canada to challenge U.S. laws requiring the use of recycled fibre in newsprint. (Shrybman, 1991, p. 13) The Canadian government has argued that a U.S. environmental Protection Agency rule banning the use of all forms of asbestos violates the U.S. Canada FTA and GATT( Eric Christensen, "Pesticide Regulations and International Trade", Environment, Vol. 32. No. 9, November, 1990, p 45)

The U.S. recently proposed in GATT negotiations that nations be prevented from adopting domestic pesticide standards more stringent than international standards. (Eric Christensen, "Pesticide Regulation and International Trade", Mark Ritchie, "GATT, Agriculture and the Environment: The US Double Zero Plan, " The Ecologist, Vol. 20, No. 6, November, 1990, p. 214.)

The U.S. based Non-Ferrous Metals Producers Committee is using the U.S.-Canada FTA to support its challenge to Canadian federal and provincial pollution control programs intended to reduce emissions from the Canadian smelting industry. ( Shrybman "Selling the Environment Short: an environmental assessment of the first two years of free trade between Canada and the United States", Canadian Environmental Law Association, January, 1991, p. 13)

(cited in Rolfe, Chris Environmental considerations regarding a possible Mexico-Canada Free trade Agreement for the West Coast environmental law association, February, 1991).

“And Mexico ... When in 1990 the US. placed and embargo upon tuna products from Mexico, "Mexico complained that the tuna embargo was inconsistent with obligations owed to Mexico under GATT. The September 1991 report of a three-member panel of experts established pursuant to the third-party dispute settlement procedures of GATT determined that the American embargo on Mexican tuna, even though designed to conserve dolphins [s] was inconsistent with the GATT” (McDorman, T. 1991, p. 2)

“The GATT Panel stated that under the GATT " a contracting party may not restrict imports of a product merely because it originates in a country with environmental policies different from its own'. ( U.S. Mexico GATT Panel, 3 September 1991, at paras 2.1-2.2). It is this statement that has been seen as the biggest problem with the "GATT Panel report from an environmentalist point of view. (McDorman, T. 1992, p. 19). However, even the normally environmentally sensitive Nordic countries have indicated that a country is not free 'to require that imported products [be] produced as cleanly abroad as at home." ( EFTA members press convening of working party, 82 Focus- GATT Newsletter 2-3 (July 1991) Any other conclusion reached by the GATT Panel would allow certain countries to dictate to others what standards must exist and this would clearly be an invasion of a country's sovereignty. Moreover, as the Panel concluded, any other conclusion would permit trade only between countries with identical regulations and this would amount to a dismantling of the GATT.” (McDorman, T., 1992, p. 19)

Direction to proceed is spelled out in McDorman’s analysis: need international agreement on priority for environmental objectives sufficiently strong that it formally and explicitly over-rides GATT where necessary.

Want to look closely at the US Mexico GATT panel report as outlined by McDorman:

He reports that the panel found that "the obligations owed by the US to Mexico under GATT prohibited use of trade measures to deal with such environmental issues [ i.e. those having effect beyond the borders of the country adopting the trade measures]. This conclusion flows from the fact that GATT may regulate conditions around product, but not around means of production, and from the view that it is still possible to talk about the actions of a particular country affecting its environment. With these orientations, GATT can conclude that "Countries cannot look behind a good to determine if the production or manufacturing process was environmentally friendly. Or in other words countries cannot impose their environmental standards or regulations on other countries by boycotting their goods. "to a certain extent, this is what comparative advantage is all about: differences in their environment of production, including the environment of government regulations".

If this is true, how do we deal responsibly with environmental concerns in an emerging North American community in which sovereign communities still wish to pursue their own vision of interpersonal and intergenerational equity and sustainability?

"Potentially, any nation could thereby justify unilaterally imposing its own social, economic or employment standards as a criterion for accepting imports. Any influential contracting party could effectively regulate the internal environment of others simply by erecting trade barriers based on unilateral environment policies." ( The Venezuelan intervention in the U.S.- Mexico GATT Panel, note 3, at para. 4.27).

Rather than considering high standards an "imposition", perhaps we could now contemplate, high standards as "the expression of collective will" . Given the recognized urgency of the global situation, the goal as the expression of collective will, should be the attaining of the highest tenable standards so that at least within the North American context, through a strongly principled NAFTA, our energy could be placed in striving in the three countries to meet this established standards rather than in using the GATT to condone and even foster lower or relax standards.

**So I would like to ask whether NAFTA can provide a lead in a [more] fruitful direction, which achieves a better reconciliation of the differing perspectives, situations and orientations of the different players. Differences in North America are not so great as in the world as a whole, and should be more easily bridged. All three countries share the same lofty rhetoric and indeed the same idealistic -- apparently potent -- legislation. All three fall down badly on implementation, on monitoring and on enforcement.**

#### **CITE STATEMENTS IN PREAMBLES INDICATING RHETORIC**

#### **NEED FOR INTERNATIONAL STANDARDS DRAWING FROM ...;**

**But all also can see the writing on the wall, and might be ready to turn around the decision structures and alter the priorities in the direction necessary to more towards sustainable development { sustainable environment} . All may be ready jointly to move against the threats of "jobs blackmail" and competitiveness blackmail" which have stalled any realistic moves thus far towards adequate pricing of resources or adequate weighting to preservation and future interests.**

Often the "job blackmail" is couched in altruistic terms as "striking a balance" or "achieving consensus". In these cases those who are concerned about giving the environment primacy are perceived to be "extremists" or of being "unreasonable." or of "not caring about the welfare of other human beings". Can we discuss a balance between the need to preserve an area and the "privilege" to engage in ecologically unsound practices? Can we discuss a balance between the right of humanity to not have to live in fear of environmental degradation and the "privilege" of labour to engage in work that could contribute to potential environmental degradation? Can we talk about balance when we ask to save 3% of the remaining ancient forests on an Island?

The time for the condoning of rationalization has past. The environment will continue to be degraded and not sufficiently preserved if people continue to condone the rationalization of engaging in ecologically unsound practices. No longer should we condone the following forms of rationalization: a) "we recognize that the practices are ecologically unsound but if we do not do them jobs will be lost, workers will be displaced, communities will become ghost towns b) " we recognize that the practices are ecologically unsound but if I don't or we don't engage in these practices someone else will" or c) "we recognize that practices in a sovereign state other than our own are not ecologically sound but the goods are so much cheaper, and what right do we have to impose our standards" Environmental preservation and protection must no longer be just tokenism. [classic statements, do they need a source?}

The time for tolerating the couching of business as usual in new euphemisms "sustainable development" has passed. An outgrowth of this toleration is a new form of industrial environmental hypocrisy where industries engage in the device of feigned altruism: the setting up of environmental divisions within an ecologically unsound industry . We have a responsibility to ensure that we are no longer deluded by industries that set up an environmental department while continuing to destroy the environment through their principal activity. [No amount of recycling of aluminum cans will make up for the destruction occurring in the production of aluminum.] The total activity of the industry has to come under environmental scrutiny.

**Working together we may be able to reach meaningful agreements on measures to avoid both "the race to the bottom" in jurisdictional competition and cost associated with the "first over the top" fear.** What is needed is strong political will for the enshrining of high common standards and of strong enforcement measures to be enshrined in a code of commitments that will be an integral part of the NAFTA.

We need to be willing to address the need to limit growth and to actually limit growth

We need to be willing to address the need to decrease consumption and to actually decrease consumption

We need to be willing to no longer tolerate ecologically unsound products or practices

We need to be willing to define what these practices and set up regulations to prevent these products or practices. (without either one of the three countries having to reduce its standards)

We need to be willing to honour wilderness preservation of significant, representative and distributive ecosystems ( at least the minimum that was recommended by the Brundlandt Commission)

We need to be willing to reduce military spending and the production of weapons of destruction and to transfer a significant percentage of those funds to research into the development and implementation of alternative safe energy, into alternative ecologically sound practices, and to redressing the current damage.

We need to be willing to recognize that pollution knows no boundaries and that international governance of environmental regulations must transcend sovereign borders  
we need to "establish regulatory regimes including environmental standards, objectives, guidelines and codes of practices" (Shrybman, S. 1990, p.28 "proposed article for inclusion in the General Agreement on Tariffs and Trade: Environmental protection")  
We need to agree that "nothing in the agreement shall be construed to prevent any party from taking any action which it may deem necessary to protect the environment, including the establishment of import or export restrictions and the use of subsidies to:  
prevent or remedy adverse environmental effects and/or conserve natural resources" (Shrybman, S. 1990, 28 from "proposed article for inclusion in the General Agreement on Tariffs and Trade: Environmental protection")  
we need to be willing to discredit all countries that flaunt rhetoric and retreat from action  
we need to be willing to insist on, and be prepared to, fund arm's length research.

### 3. POTENTIAL ROLE FOR NAMI IN ASSISTING IN THE ESTABLISHING THE HIGHEST ATTAINABLE SYNTHESIS OF OUR COMMON GOALS IN THE COORDINATION OF POLICY IN A NORTH AMERICAN COMMUNITY

I would also like to suggest that perhaps NAMI could provide leadership in bringing together of independent thinkers drawn from societies such as the Kennedy Institute, the Royal Society of Canada, the FIND ? of Mexico and build on the initiative begun in 1972 when a group of independent thinkers drawn from the scientific and social science community met prior to the Stockholm convention on the environment. At that time this group of forty drew up significant and far reaching recommendations that if, they had been followed at that time, might have facilitated the difficult decisions we have to face today. There is little satisfaction to be drawn from lamenting the fact that we should have listened then. We must help to communicate the urgency of the global situation and the need to dare to implement a new perspective. NAMI could also build on the initiative taken by Dr Fred Knelman ( who also involved in the group of 40 in Stockholm) to contact Nobel Laureates to get them involved in the urgent decisions that have to be made. We must recognize that to achieve the stated objectives of all three states, we must insist that there be high international standards in place, that individual states should be encouraged to surpass, and that these standards should be drawn from the highest tenable principles enunciated from the global community. Only then can we be assured that the environment will be given primacy and that international organizations like GATT or Free trade Boards? will not be able to condone the reduction of environmental standards to facilitate trade.

III "The exploitation of third World national and regional resources by foreign corporations, with a consequent outflow of profits from the exploited regions, has resulted in a vast and

growing economic disparity among nations and ;a monopoly of industrialized countries over production, energy, technology, information and political power Complementary to this is the flooding of developing countries with surplus goods and capital, with a resultant distortion of their economies, and the deformation of their environments into ;monocultures in the interest of further enriching the industrial states. the foreign investments, economic development and technological practices of such industrial states ;must be curbed and altered by the basic claim of a region's people to control of its resources. Use of these resources, however, should not be dictated ;by the accidents of geography, but must be allocated in such ways as to serve the needs of the world's people in this and future generations. The authority of any region's people over resources and environment includes the obligation to recognize that the environment is an indivisible whole, not subject to political barriers. The environment must be protected from avoidable pollution, destruction and exploitation from all sources". ( Earth Talk, 1972, p. 170)

“Much conventional technology and many of its proliferating products have proved ecologically harmful. We cannot reject technology per se but must restructure and reorient it. Ecologically sound technologies will minimize stresses to the environment. A rapid development of the new approach should be complemented by a technology review and surveillance system to assure that any new technology is ecologically compatible and will be used for human survival and fulfillment. It is not enough to add anti-pollution devices to existing technologies, although this might well be the initial stage of phasing out present polluting technologies. ( Earth Talk, An Independent Declaration on the Environment,” 1972)

**... few clauses from existing RIO declaration draft about prohibitions against use of environmental regulations as trade barriers, etc.**

**FIND**

**Let's recap briefly the steps already taken in the two major countries ( US story is perhaps well enough known anyway.)**

**Mexico ..citation for Salinas**

#### SYSTEMIC CONSTRAINTS;

- discrepancy between rhetoric and action
- discrepancy between regulations and enforcement
- Short-term changes as means to end
- False dichotomy between jobs and environment economic pressures and environment
- required or discretionary environmental assessment review coupled with non-arm's length research to determine environmental impact
- misplaced onus of proof
- reluctance to cede sovereignty to global governance in urgent situation
- industrial hypocrisy

"The British Columbia Federation of Labour (BCFL) also felt that free trade with Mexico would threaten the quality of life enjoyed in British Columbia and jeopardize the province's economic stability. The only advantage will be corporations' access to cheap labour. According to the respondent, Mexico will sell its cheap labour in order to attract foreign capital. The BCFL raised a number of other issues it felt should be addressed as part of the discussion on trilateral free trade: Mexico's low wages, anti-democratic union practices, the lack of environmental regulations and restrictions, unhealthy and dangerous working conditions and unprotected consumers." (Ministry of Development, Trade and Tourism, 1991, p. 27.)

As Cuauhtemoc Cardenas put it to the B.C. Federation of labour last November, "an alternative to the proposed free trade agreement should include a social charter and be based on common standards for labour, social and environmental rights. A different pact would strengthen our internal struggle for democracy and improve the situation of human rights of Mexicans in Mexico and the United States." (Salazar, J. 1991, p. 39)

Environmental problems are probably the most pressing with regard to the health and well-being of the Mexican workers. The Rio Grande, on which hundreds of communities on both sides of the US Mexico border depend for drinking water, is deluged by industrial waste, uranium mining runoff, hazardous spills from transborder transport, agricultural chemicals and millions of gallons a day of untreated Mexican raw sewage. Lax environmental standards that allow this to happen are also what

attracts U.S. and now Canadian companies to the border zones to do business.( Northcotte, 1991, p. 31 )

According to the US based Coalition for Justice in the Maquiladoras, the damaging characteristics of the maquiladoras, environmental contamination, unsafe working conditions and the exploitation of workers, have shattered the quality of life in the border communities. " (Northcotte, V. 1991, p. 31)

Although Mexico claims that it will not become an environmental haven, the general industrial perception is that, at least in the short term it will be one. The possibility of Mexico's becoming [ or becoming more of ] an environmental haven is reiterated in the section on Environmental and Pollution Control in the Ministry of Development and trade and tourism report on BC. consultations with the private sector re.: Mexico, Canada and the United States: the trilateral free trade proposal.

" Environmental regulations on businesses operating in Mexico are expected to be less stringent than they generally are for operations in British Columbia or the United States. At least initially, therefore, Mexico will be more attractive for locating new industries with pollution concerns than in British Columbia or U.S. jurisdictions. This likely will not be significant in the long term but initially it will result in some impact on the British Columbia industry. " ( Ministry of Development, Trade and Tourism, June 1991, p. 24)

The new perspective must move away from "pollution concerns" being the concerns that industry has when they have to abide by stringent regulations to being the concerns that the community has about the preservation of the ecosystem. the new perspective must also move away from considering "impact" as being economic impact to considering "impact" as being ecological impact.

[Environmental provisions necessary to prevent either one of the three countries from becoming an environmental pollution haven  
Environmental provisions to ensure that the highest tenable principles are in place to ensure that neither one of the three countries becomes an environmental pollution haven. ]

As Cuauhtemoc Cardenas put it to the B.C. Federation of labour last November, "an alternative to the proposed free trade agreement should include a social charter and be based on common standards for labour, social and environmental rights. A different pact would strengthen our internal struggle for democracy and improve the situation of human rights of Mexicans in Mexico and the United States." ( Salazar, J. 1991, p. 39)

All of our three countries appear to agree on what is needed to be done .  
Now we must ensure that what needs to be done , is done.

Report and suggestion for follow up paper

NAFTA: International environmental principles emanating from UNCED and economic constraints  
or Environmental provisions and economic constraints.  
Assessment of Environment Canada's analysis of the environmental implications of NAFTA

Concepts to examine that may be economic constraints:

NAFTA DOCUMENT

Discussion of document:

The preamble is very strong. To a certain extent, it would appear that environment has primacy over employment: the preamble reads, "Create new employment opportunities and improve working conditions and living standards in their respective territories; and this is qualified by the statement " undertake each of the preceding in a manner consistent with environmental protection and conservation:

The preamble also calls for "the development and enforcement of environmental laws and regulations;

**(Note discussion with John Fried about legal implications)**

**PROBLEM 1.**

**A state cannot establish a higher environmental standard of production and exclude goods that do not meet that standard of production, and cannot require the other states to live up to higher standards**

The following two sections appear to permit each state to establish as high standards as they deem necessary:

"Right to take Standards-related Measures" (Article 904,1)

1. Each Party may, in accordance with this Agreement, adopt, maintain or apply any standards-related measure, including any such measure relating to safety, the protection of human, animal or plant life or health, the environment or consumers, and any measure to ensure its enforcement or implementation.

"Right to Establish Level of Protection" (Article 904,2)

Notwithstanding any other provision of this Chapter, each Party may, in pursuing its legitimate objectives of safety or the protection of human, animal or plant life or health, the environment or consumers, establish the levels of protection that it considers appropriate in accordance with Article 907 (2)

Both the "non-discriminatory Treatment" and "Unnecessary Obstacles" appear to qualify a state's right to high standards

"non-discriminatory Treatment" (Article 904, 3)

Treatment no less favourable than that it accords to like goods, or in like circumstances to service providers, of any other country.

"Unnecessary Obstacles" (Article 904, 4)

No party may prepare, adopt maintain or apply any standards-related measure with a view to or with the effect of creating an unnecessary obstacle to trade between the Parties. An unnecessary obstacle to trade Shall not be deemed to be created where:

- a. the demonstrable purpose of the measure is to achieve a legitimate objective; and
- b) the measure does not operate to exclude goods of another Party that meet that legitimate objective.

Another constraint could be "disguised restrictions" (Article 712)

"No party may adopt, maintain or apply any sanitary or phytosanitary measure with a view to, or with the effect of, creating a disguised restriction on trade between the Parties.

**PROBLEM 2 That there is a provision for respecting international standards, but UNCED failed to establish international environmental standards. International principles were in place**

1. "Each Party shall use, as a basis for its standards-related measures, relevant international standards or international standards whose completion is imminent, except where such standards would be an ineffective or inappropriate means to fulfil its legitimate objectives, for example because of fundamental climatic, geographical, technological or infrastructural factors, scientific justification or the level of protection that the Party considers appropriate." (article 905, Use of international standards)

In the section on Compatibility and equivalence

"1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the Parties shall, in accordance with this Chapter, work jointly to enhance the level of safety and protection of human, animal and plant life and health, the environment and consumers.

2. Without reducing the level of safety or of protection of human, animal or plant life or health, the environment or consumers, without prejudice to the right of any Party under this Chapter, and taking into account international standardization activities, the parties shall, to the greatest extent practicable, make compatible their respective standards-related measures so as to facilitate trade in a good or service between the parties.

Note that International standard is defined as "a standards-related measure, or other guide or recommendation, adopted by an international standardizing body and made available to the public, and "international standardizing body" is defined as

a standardizing body whose membership is open to the relevant bodies of at least all the parties to the GATT, including the International Organization for Standardization (ISO), the

international electrotechnical Commission (IEC), Codex Alimentarius Commission, WHO, FAO, ITU International Telecommunication Union (ITU); or any other body that the Parties designate;

**ACTION:** to advocate the inclusion of bodies that have embodied environmental provisions; UNEP, IUCN

### **PROBLEM 3: HARMONIZING OF STANDARDS TO LOWEST COMMON DENOMINATOR**

Article 713: International Standards and Standardizing Organizations

1. Without reducing the level of protection of human, animal or plant life or health, each Party shall use, as a basis for its sanitary and phytosanitary measures, relevant international standards, guidelines or recommendations with the objective, among others, of making its sanitary and phytosanitary measures equivalent or, where appropriate, identical to those of the other Parties.

[does this mean never below international standards?]

### **PROBLEM 4: LIMITED REFERENCE TO INTERNATIONAL DOCUMENTS ON THE ENVIRONMENT ( NOTE NO MENTION OF RIO- unless in Annex 104, check in Annex 104); Note only reference is to "specific trade obligations" in the environment treaties:**

**[ACTION; TO OPEN UP NAFTA TO ENSURE THAT THE DOCUMENT IS COMPATIBLE WITH UNCED DOCUMENTS]**

**Treaties mentioned:**

- convention on International Trade in endangered Species of Wild Fauna and Flora ( 1973)
- the Montreal Protocol (1990)
- Basel convention on the Control of trans-boundary Movement of Hazardous Wastes and their disposal (1989)
- Annex 104-1 Bilateral and Other Environmental and conservation Agreements
- 1. The agreement between the Government of Canada and the Government of the U.S. concerning the trans-boundary Movement of Hazardous Waste, signed at Ottawa, October 18, 1986
- 2. The agreement between the U.S and Mexico on cooperation for the Protection and improvement of the Environment in the Border Area, 1983.

**\* see Annex 104-1 for other agreements**

Such obligations shall prevail to the extent of the inconsistency, provided that where a Party has a choice among equally effective and reasonably available means of complying with

such obligations, the party chooses the alternative that is the least inconsistent with the other provisions of this Agreement.

**ACTION: note that there is the provision to add other environmental agreements.**

The parties may agree in writing to modify Annex 104.1 include any amendment to an agreement referred to in Paragraph 1 and any other environmental or conservation agreement.

### **PROBLEM 5: PRIMACY IS GIVEN TO NAFTA OVER OTHER INTERNATIONAL AGREEMENTS**

NOTE: THAT IN ARTICLE 103, "Relation to Other Agreements, this agreement is given primacy

1. the Parties affirm their existing rights and obligations with respect to each other under the GATT and other agreements to which such Parties are party.
2. In the event of any inconsistency between this Agreement and such other agreement, this Agreement shall prevail to the extent of the inconsistency, except as otherwise provided in this Agreement.

NAFTA

Perspectives and Actions

#### DEPARTMENTS

1. External Affairs

Documents:

North American Free Trade Agreement Implementation Act: The NAFTA Partnership. March 1993

Content:

It is primarily a document about Canadian Business interests

"NAFTA will provide further new opportunities for Canadian goods and services. Canadian firms will be able to expand sales in sectors that were previously highly restricted, such as autos, financial services, trucking, energy and fisheries. "

Mexico Canada's largest trading partner ( 3 billion, 1991)

"Canadian business has already begun to take advantage of these new trade measures to increase their presence in Mexico. "

Participants:

The Export Development Corporation (EDC)

The Business Co-operation Program of the CIDA

CIDA/Inc (several environmental protection and control projects related to air and water pollution, hazardous waste disposal and

rehabilitation of wetlands in proximity to industrial and residential areas. )

Investment Canada is also developing a program to encourage Mexican investment in Canada

EAITC has organized a trade promotion program in Mexico directed at specific sectoral opportunities, to introduce as wide a cross section as possible of potential exporters to the marketplace.

In order to capitalize on existing opportunities in Mexico and give depth to heightened economic relations as envisaged under the NAFTA, the Canadian private sector is preparing to position itself effectively in this growing market.

The most likely sectors of concentration for Canadian entrepreneurs are mining, agro-industry, food, transportation, environment and tourism development.

Successful Canadian exporters

SR Telecom, Du Pont, Canada Export Award Winner in 1992,

Dare Foods, Cansec Systems, Royal Plastics, Garden Grove Produce, Rebound Rig international oil equipment (900,000);

Bovar-Western research (1.5. M) instrumentation control of their sulphur recovery units

Chronology:

Note: March 18. (1992). Canada provides Mexico with 1\$ million worth of environmental assistance. [what was the nature of the assistance]

September 17 (1992) Washington, D.C. — Environment ministers of the NAFTA countries agree to establish a Trilateral Environmental commission to explore co-operation on environmental issues.

November 3, 1993 the Canadian Environmental review of the NAFTA is released.

## 2. Environment Canada

### 2.1.

### 2.2. Legal interpretation

John Fried. (943-2803) Specialist in legal interpretation of NAFTA

Preamble is strong on the environment but the preamble carries little weight.

No mention of environment in the "objectives". John Fields said that the preamble sets the context but the environmental provisions would be stronger if in the objectives". The document would be a lot stronger on the environment if the environmental provisions had been placed in the "objectives section".

To do this the three countries would have to agree to open up the document again. Up until now the countries have refused to do this. [However, with Mulroney and Bush gone, perhaps an argument could be made to open the document up and place the environmental provisions in the "Objective

section" ; this could be better than having a separate parallel agreement on the environment"

Body of text:

An important section

Note: Article 906 Compatibility and Equivalence

1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the Parties shall, in accordance with this Chapter, work jointly to enhance the level of safety and of protection of human, animal and plant life and health, the environment and consumers.

Key issues:

Extra-territorialism

National security (21-2)

#### • INTERPRETATION OF NAFTA BY ENVIRONMENT CANADA

"North American Free Trade Agreement: Canadian Environmental review, October 12, 1992.

Purpose;

to ensure that the NAFTA would be consistent with Canada's commitment to the protection of the environment and to sustainable development, as set out in the Green Plan, a four point plan was adopted to integrate environmental concerns into each element of the NAFTA decision-making process.

1. ITAC environmental representatives were appointed to the International Trade Advisory Committee, and to eight of the Sectoral Advisory Groups on International Trade (SAGIT). These important trade advisory bodies, which include 311 representatives from business, environment, labour and academic, report directly to the Honourable Michael Wilson, Minister of Industry, Science and technology and Minister for International Trade.

the environmental representatives on these committees ensure that environmental considerations are taken into account when the ITAC and SAGIT prepare recommendations for the government

(Note; involvement of Sierra Club, and Pollution Probe)

Mid-march 1993 Trilateral talks begin on agreements on labour and the environment

2. Canada's standards negotiators were responsible for ensuring, among other objectives, the continuing right of governments in Canada to establish, to maintain and to enforce environmental standards that reflect Canadian conditions and Canadian priorities. The integration of environmental concerns in the negotiating process is a preventive approach. It sets a precedent that will be continued in future trade agreements.

(Intro)

Canada's standards negotiators were responsible for ensuring, among other objectives, the continuing right of governments in Canada to establish, to maintain and to enforce environmental standards that reflect Canadian conditions and Canadian priorities. The integration of environmental concerns in the negotiating process is a preventive approach. It sets a precedent that will be continued in future trade agreements.

### 3. The Minister for International Trade

Bill C-115 an Act to implement the North American Free Trade Agreement;  
Note that no environmental legislation, other than pesticide Act, is mentioned in the index

Note in the second whereas which indicates further resolve, the environment is not mentioned specifically

Note in the fourth whereas "it is necessary, in order to give effect to the Agreement, to make related or consequential amendments to certain Acts;" (environmental acts not included- does this mean that they are included or excluded)

### 4. NGO perspective (Elizabeth May, Sierra Club)

3. stances of environmental groups.

1. Pollution Probe "work with government on NAFTA"

2. Action Canada "reluctant to work with government"

3. Sierra Club "Use NAFTA to achieve environmental protection"

1993— 1995. Participated as a member of the Working group for establishing criteria for discharge emissions for British Columbia” . Prepared an Alternative report on the need for  
PRINCIPLES

( ) THAT IN 1993 David White and I exposed what we referred to as “Timbergate” We filed a freedom of Information request about leaked information about serious accusations about TFLs

February 1993

• 1993 co-initiated a Freedom of Information request on overestimation of forest inventory in the Queen Charlottes and publicized the results

COMMENT

We entitled the campaign: "Timbergate." This campaign was linked to the failure of the BC government to enforce the Forest Act, as their failure to enforce international obligations.

Document

We were notified by the Inventory Branch that we could come and pick up the documents. David was teaching so I went in his place to pick up the documents . I

arrived and was astonished that I was ushered into a room with 12 men including representatives from MacMillan Bloedel.

I asked if given the discrepancy between the original inventory and the reassessment was the Ministry going to reassess all the other TFLs The Director of the Branch the chair Said, “God willing” [ which seemed a bizarre response , given that he was responsible for making decisions]

#### TIMBERGATE

called upon the RCMP to investigate corporate crime in corporate crime related to the investigation. Bruce Torrie, who was continually suffering from back pain was lying on the floor reading the Criminal code.

~

- 1993. Wrote a paper on the Discrepancy between the Canadian government's Environmental Assessment of NAFTA and what was actually in NAFTA within a context of international principles and presented it at a forum on NAFTA organized by the Council of Canadians

#### COMMENT

I prepared a diagram, (Ideagraph) displaying different statements on climate change and acid rain and ozone depletion from the 8 countries

( ) **THAT** in 1993-1994, I carried out a content analysis of Science Council of Canada documents and publications in order to determine the development of awareness about environmental issues specifically the emergence of the awareness of climate change

In 1993, I co-authored a paper with Rod Dobell

Global Atmospheric Risks and the Science Council of Canada: The Case of Climate Change

Rod Dobell and Joan Russow  
March, 1993

Annex to Contribution Number D.1, Version 2  
for the project on Social Learning in the Management of Global Environmental Risks.

Please send comments to R. Dobell and J. Russow, Department of Public Administration, University of Victoria, Victoria, Canada. Fax-604-721-8849

This work was partially supported by the John D and Catherine T. MacArthur Foundation and the Atmospheric Environment Service of the Government of

Canada This Annex examines the treatment of climate change in publications of the Science Council of Canada, identifying for expository purposes five phases:

Phase 1. (1968-1976). In this phase the Council moved from the early formulation in 1968 of goals and policies related to the environment, and early exploration of scientific data related to the global warming issue in 1972, to a Conference sponsored by the Council in 1975 on "Living with Climatic Change" and the publication of the proceedings from this conference in 1976.

Phase 2. (1977) The Science Council published its significant document, *Conservation Society: Resource Uncertainties and the Need for New Technologies*. In the same year, the Council also published documents related to environmental and health regulations, and the Government of Canada passed legislation requiring environmental regulations to be subjected to Socio-economic Impact Analysis (SEIA).

Phase 3. (1978-1983) In this third phase, Council documents are more strongly oriented toward economic issues, coupled with a few significant publications on regulation of activities affecting the environment.

Phase 4. (1984-87) Pre-Brundtland: During this period of Brundtland Commission hearings, there was in Council policy documents a continued emphasis on the economy; if there was concern for sustainability it was primarily for economic sustainability.

Phase 5. (1988-1992) Post-Brundtland: In this phase the Council embraced the expansive interpretation which the National Task Force on the Environment and the Economy gave to the concept of "sustainable development."

These phases reflect to some extent the different frames through which actors might view issues related to the environment and the economy. In the policy reports from the Council there appears to be some swing from a perspective initially giving environmental concerns primacy over economic issues to a stronger concern for the economy and competitiveness.

More generally, in the twenty-five years from 1967 to 1992, Canada moved from a policy culture much like the British tradition of elite advice to one much more like the American populist approach. That is, an emphasis on orderly administrative processes of policy formation and regulation founded on expert advice and an influential scientific elite gave way to a culture dominated by multi-sectoral interest-based consultation, concern for participatory mechanisms and the interaction of advocacy groups advancing scientific argument to further their particular interests. The creation in 1966 of the Science Council of Canada as a federally-funded agency to provide independent scientific and analytical advice governments, industry, and educational institutions, and its demise (along with a wider range of other independent advisory bodies) at the hands of the Conservative government in the Mazankowski budget of February, 1992 thus neatly brackets not only an extraordinary swing in political outlook but also a dramatic shift in policy culture. At the time, the termination of the array of independent bodies offering expert policy advice based on a maintained database and continuing analytical capacity was justified in part on the grounds that a wide range of

consultative bodies had been created, and a wide array of non-governmental think-tanks and advocacy groups had sprung up to offer advice to government, so that the analytical work of government-funded advisory groups was largely deemed redundant. In particular, for example, the work of the Science Council on atmospheric risks or environmental issues had been overtaken by the activities of federal, provincial and local roundtables on environmental and economy, established in the wake of the Brundtland Report, on the unanimous recommendation of a national Task Force on the Environmental and the Economy, representing industry, environmental groups and a range of other constituencies.

An interesting consequence may lie in the psychological weight attached to environmental risks as social issues. In the early history of the Council, many of its reports reflected serious concerns emerging from the academic scientific community about environmental degradation and the possible consequences of uncontrolled discharges from human activity. These concerns thus carried the weight of "objective" science and were seen as general problems to be addressed by all society. In the more recent setting of consultative processes and roundtables, by contrast, "the environment", rather than being recognized as the space within which we must all live, and the over-riding context within which social structures as well as economic activity must operate, often becomes slotted as just another interest pressed by just another set of interest groups, to be balanced against equally valid interests in some compromise outcome, usually on the basis of something other than scientific considerations.

Around the middle of its short life, the Science Council itself took note, as mentioned below, of this interesting cultural transition in process, commenting on the shift in emphasis from "reasoned outcomes" to "negotiated outcomes" inherent in the move from councils made up generally of independent scientists seeking a consensus in interpretation of uncertain scientific evidence to consultative bodies and conflict resolution processes seeking consensus, usually compromise amongst representatives of interest groups advocating responses to that uncertain scientific evidence. The creation of the Council at the height of "Sixties" enthusiasm for reason and the analytic way in government and its replacement by roundtables reflecting a new enthusiasm for what Canadians have come to call "the Rio Way (openness, transparency inclusiveness)" provides a perfect cameo image of the larger social swing.

In a separate working paper, we hope to explore some of the fascinating larger implications of this process for the effectiveness of representative government, for the nature of ministerial responsibility and the definition of the public interest, and for the utilization of analytical and advisory work in consultative and advocacy processes. (In particular it will be important to examine the procedural consequence of substituting direct interest-based negotiations seeking a consensus which governments might be bound to respect in place of earlier advisory processes from which traditionally those with significant private interests would feel obligated to exclude themselves. It is perhaps ironic that a positive conflict of interest — the existence of a private interest sufficient to influence, or perceived to be sufficient to influence, official action — is precisely what is sought in the representatives participating

in these new wave consultative processes.) Here we explore only one aspect of the Council's work, its advice and commentary on the possible risks associated with anthropogenic impacts on processes of global atmospheric change. It is interesting that even within the Council's own work, one can see the evolution over a couple of decades toward the consensus-seeking negotiation role emphasized with the broader political system.

## 1. PHASE 1 (1968-76)

### 1.1. 1968-1971 Preliminary formulation of atmospheric issues

In this early period, there were a number of recognitions that form a basis for the full formulation of the climate change issue by the Science Council in 1972. These moved from a concern about the impact of anthropogenic activities on the atmosphere (air pollution) or an interest in the possibility of climate amelioration or modification in 1968; through linking of associative issues like deforestation to climate change, and proposals for goals to control emissions; to calling for an environmental conscience and environmental assessment, and advocacy of a preventive approach to environmental risks.

Certain fundamental principles related to policy goals, strategy and implementation advocated at this time have important implications for the global warming issue.

From the inception of the Science Council there was not only a recognition of the potential policy conflict between public and private interest

One man's effluent is another man's intake. It has become clear that there is a public interest which is not always coincident with or optimized by the pursuit of private interest. The problems which stand in the way of realizing the optimum condition for life in contemporary society, as a society, will not necessarily be solved in an optimum way, or may not even be soluble at all by private or piecemeal approaches. A total "systems approach" may be essential. (1968, 30)

but also, an emphasis on the systems approach to "community planning and human environment" (41).

These two themes were continued throughout the reports from the 1968-76 period:

The 1968 policy report, *Towards a National Science Policy in Canada*, referred to various underlying aspects of the global warming issue: The need for implementation of policies for (a) "development of sound programs for the use, conservation and replenishing of resources" (14); (b) establishment of methods for the "control of existing and threatened health hazards already created by the misuse of science and technology—e.g., Pollution." (15); and (c) the need to move from unsuccessful "fragmented efforts" to a "co-ordinated approach" because of the "complex nature of the total ecology" (p.41).

Even though these observations related to the environment are noted, the thrust of the report suggested that the Council's primary role is to assist industry (24), and it referred primarily to social and economic rather than environmental costs (35).

Interest in the atmosphere emphasized the advancement of Canadian capability in the science and technology of the upper atmosphere and space; for furthering the development of Canadian industry in relation to the use of the upper atmosphere and space; and for the planning and implementation of an overall space program for Canada" (Science Council Report No. 1, *A Space Program for Canada*. 1968 (36)

At this time the concern about climate change appeared to be confined to recognition of the possibility of weather modification and control "with the objectives ...to maximize the advantages which Canada's climate offers and to minimize its deleterious effects" (ibid, 47).

In the 1970 Report, *Seeing the Forests and the Trees*, an important aspect of the global warming issue was referred to: the linking of deforestation and climate change. On page 10, the report indicated that "the cutting of large areas... can have major effects on local climate." The possibility of the impact of reforestation on local climate was also suggested.

In another Report, *This Land is their Land*, the need to develop "environmental science as well as an environmental conscience" was expressed (18). This report also advocated several key elements of policy and goal formation related to environmental issues generally: the policy of requiring resource developers to be partially responsible for the financial costs of environmental assessment (20); and the importance of undertaking preventive measures (36).

In another report the same year, *Canada, Science, and the Oceans*, the Council, without identifying the full complexity of the global warming issue, did recognize an essential aspect, the interlinking of pollution, oceans and climate:

Knowledge of the various processes occurring in the oceans (e.g., ocean currents, mixing mechanisms and energy-transfer processes) is required for a better understanding of phenomena such as marine biological productivity and climate, for the design of equipment and instruments to be used in the marine environment, and to cope with pollution problems.

In the 1971 Report, *Cities for Tomorrow: Some Applications of Science and Technology to Urban Development*, acknowledgement of the urgency of the environmental crisis, a key element in the global warming issue, was forcefully made, in language foreshadowing the message from the Toronto Conference in 1988.

But recently the alarm has sounded loud and clear. Spoilage of landscape, radiation fallout, pollution, were seen to lead to an eco-catastrophe potentially as ravishing as war itself. (p.6).

Not only was the urgency acknowledged but also the inadequacy of our "solutions" or "response assessments" was revealed, through the recognition that sometimes solutions could be more severe than the problems solved (6).

There was also mention of the alarming increase of gaseous wastes being discharged into the atmosphere (48).

Two significant concerns related to the global warming issue were also articulated: the goal to reconsider our "Growth-oriented approach of society:

...just what is economic growth other than a reduction in the scarcity of goods and services? So long as goods such as pure air, unpolluted water and amenities derived from nature or a pleasant environment were regarded as "free" goods belong outside the economic sphere, it was quite legitimate not to account for them. Today an altogether different situation has arisen—to make these goods less scarce is to add to the world's assets and to increase human satisfaction. It thus means contributing to economic growth taken in a broader sense than the mere expansion of production, which itself is but one means of better satisfying man's needs.

'Extending the goals of economic policy to embrace a new' quality of existence' concept is apt to change the allocation of resources significantly,

and the goal to include the intangibles of the environment in accounting:

A more comprehensive accounting system would add to these internal costs involved in the total production-to-waste process (e.g., such measurable costs as are involved in waste treatment and disposal, as well as some indication of intangibles involved in environmental decay, discomfort, etc.). Even more comprehensively, from a national welfare point of view, a pricing system should take account of increasing scarcity of resources. It is ironic in this connection that through the mechanism of depletion allowances the incentive is precisely the opposite, i.e., favouring rapid exploitation of non-renewable resources. (54)

All these insights recognitions, goals and strategies, remain still to be adequately reflected in contemporary practices.

## **1.2. 1972-75. Formulation of Climate Change issue:**

In the council's report, *it is Not Too Late—Yet*, published in June 1972 at the same time as the UN conference in Stockholm; the global warming issue was well formulated:

" On a global scale, a growing body of fragmentary evidence suggests that the sum of a large number of local pollutants may be creating some world-wide air problems. The average concentration of carbon dioxide in the troposphere in the Northern Hemisphere has been increasing at the rate of 0.7 + or - 0.1 p.p.m. per year over the last decade. This is much less than would be expected from an evaluation of the total increase of man-made emissions over the same period, indicating that there are some compensatory mechanisms in the global carbon dioxide cycle, but it is nevertheless an indicator of change. An increase in atmospheric carbon dioxide should, acting alone, cause an increase in global temperature due to the so-called "greenhouse effect": accordingly, there has been speculation that world climate will become warmer. (p. 14)

Acting in the opposite direction is the possible effect of increasing quantities of particulate matter in the atmosphere, from industrial sources, jet aircraft, and so on. The screening effect of these particles should theoretically cause global air temperatures to fall. Considering that energy production and heat release, manipulation of surface and underground waters, change and

destruction of vegetation, and changes to the Arctic ice pack may also cause changes in global air temperature, the net climatic result is difficult to predict. There is at present no compelling information on the nature of the total impact of air pollution on world climate. " (p. 14-15)

"Climatic changes may also occur in local areas as a consequence of large-scale human activity, such as seeding clouds to increase rainfall, construction of major dams, deforestation or the construction of airports. (p. 15)

The Science Council considers that studies ...should be carried out at an earlier stage of planning, and recommends that projects having a possible significant impact on the environment should include as essential elements of feasibility and planning studies, assessment of climatic and ecological consequences as well as proposals for the alleviation of harmful effects, before the projects are considered for implementation." (p. 15)

The food security concern is also mentioned, reiterating the discussion by Reid Bryson in 1967. In the Report, there was reference to the effect of any temperature change:

Canada's productive land areas could be profoundly affected by any global air temperature change, either upward or downward, because most of our crops are sensitive even to small average air temperature variations." (p. 15)

This report also reflected on the "scope, complexity and inevitability of environmental problems" (10), then reiterated the urgency of the environmental crisis, the global impacts and the need for the global action:

"As an added element, environmental impacts now transcend national and continental limits, and we have gained direct appreciation of the greater quantity of human activity everywhere in the world. Beginning with the news of world-wide radioactive fallout, there has been increasing evidence of the global air circulations that disperse contaminants widely and imply the need for global action. ...It is now necessary for every nation to ponder not only the abuses it tolerates in its own territories, but also the problems it creates for others or receives from others. " (p. 13)

and concluded with strong recommendations for the development of and implementation of strategies to address concerns about potential climate change and its impacts.

After assessing the present status of the quality of the physical environment of Canada, the Science Council recommends:

1. a) continuing Canadian participation and initiative in programs for international monitoring and research, to improve understanding of the trends in changes in the chemistry and physics of the atmosphere, related to the increase of pollutants and their possible long-term environmental consequences; (b) the development of strategies to reverse harmful effects.
2. that projects having a possible significant impact on the environment should include, as essential elements of feasibility and planning studies, assessment of climatic and ecological consequences as well as proposals for the

alleviation of harmful effects, before the projects are considered for implementation

3. that the attention of federal and provincial governments focuses on the environmental effects of modern industrial agricultural practices, particularly those of 'monoculture'

(i.e., the wide-spread and repetitious cultivation of single crops)

4. that increasing attention be given to the application of forest technology that is mindful of environmental considerations, as well as of maintenance of the long-term production and other advantages of forest lands.

and with the admonition that "Our accidental experiment in planetary engineering still has a long way to go" (4).

In a 1972 background study *Air Quality— Local, Regional and Global Aspects*. Professor R.E. Munn recommended extending the definition of "Air Pollution" in Bill C-224, *An Act Relating to Ambient Air Quality and to the Control of Air Pollution* (1971), to accommodate new knowledge about climate change to cover "not only the conventional trace gases and particles monitored by control agencies, but also carbon dioxide, water vapour and heat" because of their possible climatic effects (p. 10). Munn also reiterated the need for a systems approach to environmental issues, where decision makers move away from "quick engineering solutions."

We must remember above all else that ecological systems must be examined in total. Quick engineering solutions suitable for application to small components of an ecosystem may treat the symptoms without curing the causes of environmental degradation. (32)

In its 1973 Report, *Science and International Affairs*, the Science Council advocated new national goals beyond those of the vested interests that "have for a long time been accustomed to being the unquestioned suppliers of 'National goals'." The Council called for the creation of a "symbiotic combination of scientific and political expertise" (18). (This symbiosis appeared to have been conceived of as part of the 1975 Conference on "Living with Climatic Change.")

This report also reiterated the "transnational character of many areas related to science and technology; protection of the environment...the earth's atmosphere (18).

In another 1973 Report, *Natural Resource Policy Issues in Canada*, the Council chastised administrative policies that failed to address the urgency of the global crisis:

folly of policies which could lead to a heavily armed global community existing under severe strains due to environmental deterioration, mis-allocation of resources, crowding, or irreconcilable extremes of poverty and affluence. (39)

In this report, the "conservator society" principle was mentioned for the first time in Science Council documents. The "conservator society," because of its emphasis on moving away from resource consumption, would have been

one that could address concerns related to climate change, though these do not appear to be explicitly linked in this document.

Within this global context, the Science Council recommends that Canadians as individuals, and their governments, institutions and industries, begin the transition from a consumer society preoccupied with resource exploitation to a conserver society engaged in more constructive endeavors. Ideally, Canada could provide the leadership necessary to work toward more equitable distribution of the benefits of natural resources to all mankind.

One of the recommendations emphasized compatibility between short and long-term goals in language made more familiar in the Brundtland Commission's later definition of "sustainable development":

It might appear that this recommendation for movement away from a growth-oriented society is in direct conflict with other recommendations the Science Council has made. This is not the case. It should be possible to work toward satisfaction of the short-term demands for employment and material benefits without jeopardizing long-term goals. Every effort should be made to keep the solutions to the short-term problems compatible with long-term goals. (39)

Professor F.K. Knelman in *Energy Conservation*. (Science Council of Canada Background study No. 33 (1975), enunciated what he perceived to be the goal for the initiation of the "conservation ethic":

Historically, conservation has been the group of measures adopted to prevent rapid resource depletion and despoliation. ...Today we have detailed and precise insights into the set of intricate and delicate interactions between the use of particular renewable resources... Further to this we have countless more recent examples of the gross impact of the rapid and ruthless exploitation of non-renewable resources such as minerals and fossil fuels on the air, the water and the soil. (11)

"Human intervention through the application of new technologies has increased our capacity to affect our environment. The ever-increasing scale and intensity of this intervention now seems capable of threatening the integrity of much larger ecosystems and even some of the great natural biogeochemical balances. (11)

"With both conservation and efficiency, care must be taken to consider situations holistically, i.e., as total systems, or we will simply discover that seemingly rational actions on a part of the system will lead to unanticipated and undesirable interactions with the whole system. (12)

The profligate practice of depleting non-renewable resources at the highest possible rate is no longer an acceptable international behaviour. Canada in particular has demonstrated and established its international commitment to global environmental and resource management at the UN Stockholm Conference on the Human Environment. The Man and Resources Conference of the Canadian Council of Resource and Energy Ministers (CCREM) in

October 1973 confirmed that a conservation ethic needs to be accepted as both a national and international goal. (13)

In summary, this survey of the reports from 1968 to 1975 outlines the basis for the framing of the issue of global warming, and recommendations for goals that could assist the global community to address the risk of climate change more generally. These reports were the precursor for an important Conference in 1975.

### **1.3. 1976. Scientific analysis of the issue of Climate Change**

In the 1976 Science Council Report, *Living with Climatic Change*, the proceedings of the 1975 Conference on Climatic Change, organized by the Science Council with co-sponsorship from US and Mexican scientific bodies, were reported.

This conference was designed to address the "absence of communication between the meteorologists with the knowledge of climate change and the economic and social decision makers and planners." The first phase was to bring together the scientists; the second phase was to be a series of meetings with decision makers and planners.

In this report scientists analyzed the data related to the history of climate change, and to current theories. On the basis of these data, they made predictions about the nature and extent of climate change and variability that could occur by the year 2000. Although the main focus of the document was on climate change, and although the scientists acknowledged the potential cooling effect of volcanoes and of dust particles, they appeared to lean toward the view that there could be a general warming of 1 degree by the year 2000.

In the preface there was a strong call for the need to include climate and climatic variability in the planning process.

There is growing evidence that the world is entering a new climate regime. Both the rate of change of the climate and the amplitude of short period climatic variations will be much more pronounced. (Foreword)

Small changes in the basic underlying premises of our plans for meeting present and future needs may produce large effects. Climate and climatic variability must be taken into account in the planning of nearly all facets of human life. (9) (Emphasis in original)

The scientists, however, though acknowledging the need to consider climatic variability in planning considerations, were cautious about the claims they made. Comments about "climatic variability" were almost always expressed in conditional language with emphasis on the "uncertainty" associated with any forecasts of climate change.

In addition to natural climate variations, we are also faced with the possibility that we may be changing the climate by our own actions. In the aggregate, the burning of fossil fuels for heating and energy production releases enormous quantities of carbon dioxide (CO<sub>2</sub>) and particles into the atmosphere. These can potentially alter the workings of critical physical

processes and therefore alter local, regional or global climate. Even man-made changes in trace constituents such as chloro fluorocarbons (better known under the Du Pont trade name "Freon") may be capable of producing significant changes. More perplexing is the recent discovery that nitrogen fertilizers might also perturb the natural atmosphere. (11)

They appeared, however, to be certain about the cause of potential climate variability, even though hesitant about the outcome, extent and nature of changes to be anticipated.

## Causes of climatic change

### Carbon Dioxide

Atmospheric carbon dioxide participates in the chain of interactions which form the natural carbon cycle. This cycle involves the storage and transfer of carbon, in various forms, in and between the atmosphere, ocean, biota, on the land surface, and in ocean sediment. The concern for climate arises from the perturbation of the natural carbon cycle due to burning of fossil fuels. It is generally agreed that there has been an increase in atmospheric carbon dioxide of about 10 percent since the late 19th century and that the increase is continuing and possibly accelerating.

As a result of increased CO<sub>2</sub> heat is retained in the atmosphere, particularly in polar latitudes. This increase is theoretically predicted to contribute to higher surface temperatures.

The effect of the manufacture of CO<sub>2</sub> on climate depends on the rate of production and on the processes, which remove CO<sub>2</sub> from the atmosphere. Such processes include storage in the biota and absorption in the ocean. There is the troublesome question of possible feedback effects. Warming due to CO<sub>2</sub> may reduce the oceanic ability to store CO<sub>2</sub>, for instance.

A doubling of atmospheric CO<sub>2</sub> is considered likely by the early 21st century, although this could be averted by a more rapid than expected phase-out of fossil fuels as a prime energy source. The potential effects of CO<sub>2</sub> production on climate therefore merit close attention, (87).

### Ozone

Predictions that some human activities will lead to depletion of the atmospheric ozone shield have received considerable attention recently. The bulk of the ozone lies in the stratosphere, where its absorption of solar ultraviolet radiation both screens the surface from biologically damaging radiation, and provides the major heat source for this region. Since the atmosphere is coupled to lower layers radioactively and dynamically, changes in ozone amount may cause significant changes of climate at the ground.

The total amount of ozone may change as a result of variations in the solar ultraviolet output and as a result of variations in the amounts of variety of a chemical species involved in photo-chemical reaction (88).

### Nitrogen Oxide

Nitrogen oxides (NO<sub>x</sub>) are important in the natural photochemical balance of ozone. One of the major sources of NO<sub>x</sub> is the activity of micro-organisms in the soil and in the oceans. Of growing importance, however, are various

anthropogenic sources related to the increasing use of nitrogen fertilizers and the engine emissions of stratospheric aircraft. NO<sub>x</sub> may also be deposited in the stratosphere by nuclear explosions.

In addition to NO<sub>x</sub>, chlorine compounds reaching the stratosphere may be very effective in depleting the ozone layer. Of particular concern here are chlorofluorocarbons (CFC, or 'freons') and other chlorine compounds... (88)

#### Other possible causes of climatic change

Additional human effects on climate may follow from the release of waste heat, and from alterations to the energy and hydrological cycles due, for instance, to land use practices, to irrigation and to alterations of natural waterways. While such factors are at present assumed to be important only to local climate, the possibility exists that they may lead to or reinforce large scale climatic disturbances.

#### Water vapour-greenhouse feedback

The atmosphere is believed to maintain a somewhat uniform distribution of relative humidity over a large range of lower atmosphere temperatures even though the absolute amount of water vapour in the air varies strongly with temperature. The absolute amount of water vapour in the air varies strongly with temperature. The absolute amount of water vapour in the atmosphere determines, to a large extent, the opacity of the lower atmosphere to infrared radiation. Increased temperature at constant relative humidity leads to increase trapping of thermal radiation ('greenhouse effect') which gives rise to further increases in the temperature of the lower atmosphere. In this manner, external forcing which leads to an increase of temperature (for example, an increase in CO<sub>2</sub>) may amplify the warming effect. (89)

#### Cryospheric feedback

The high reflectivity of snow and ice, as compared to water or land surfaces, is a dominant factor in the climate of polar regions. The extent of the snow and ice cover of the earth's surface depends strongly upon surface temperature. If a lowering of the planetary temperature would lead to a long-lasting and more extensive snow and ice cover, this would cause a decrease in the amount of solar energy absorbed by the earth-atmosphere system and thereby a further lowering of temperature. Again, any factor that tends to warm (cool) the climate may have the warming (cooling) effect amplified by this feedback. (89)

The predictions related to climate change were ambiguous. It is difficult to know whether they believed that the global warming trend indicated by increases of CO<sub>2</sub> would be counteracted by the cooling caused by natural activities such as volcanoes or by anthropogenic activities leading to particle formation, or whether a global warming trend would be initiated with potentially catastrophic implications. An overall but slight warming trend seemed to be the general expectation, but the emphasis was very much less than in the Council's own 1972 analysis. Climate variability appeared to have replaced global warming as the risk to be confronted.

Predictions of climatic change

The ability to predict the time sequence of future climatic events is still very limited (90).

There is an important class of predictive problems for which we are forced to rely exclusively on mathematical models. These involve the assessment of human impacts on climate. Because certain human activities are known (or suspected) to alter the environment in hitherto unprecedented ways, we cannot draw upon past experience alone to estimate their potential significance to climate. Despite their shortcomings, models will have to be relied upon to evaluate the impacts of society on the climate. (91)

(See Table 6 in Fig. 1)

An associated table set out "possible causal factors in future climatic change to the year 2000 A.D.," identifying

- Total solar output (effect not clear),
- Volcanic activity (leading to possible cooling)
- Increased Anthropogenic carbon dioxide (leading to a cumulative warming effect of about 1 degree)
- Increased particulates (unclear)
- CFC emissions (leading to warming of 1 degree)

It is interesting to note also an estimate of 10% depletion of stratospheric ozone, based on the assumption that controls on CFC and other emissions are put into effect by 1980 A.D.

## **2. PHASE 2. (1977) "CONSERVER SOCIETY" AND ENVIRONMENTAL REGULATIONS**

### **2.1. Conserver Society: sustainable environment or sustainable resources?**

In the 1977 Report, *Canada as a Conserver Society: Resource Uncertainties and the Need for New Technologies*, the Science Council delineated a complex proposal for a society that would recognize the limits on its resources and would be responsible for acting within those limitations. As a footnote on the hesitant processes of social learning, it is perhaps noteworthy that there is no specific reference to climate change in this significant Science Council document. In the 1976 publication *Living with Climatic Change*, as mentioned above, it was concluded and underscored that Climate and climatic variability must be taken into account in the planning of nearly all facets of human life. (9)

In the 1977 Report, however, there were numerous generic references that would have had implications for the climate change issue: a) the need to preserve ecosystems; b) the need to recognize that cause and effect could be separated by significant periods of time ; c) the need to consider intergenerational equity; and d) the need to move away from non-renewable sources of energy.

Considerations related to "the ecological theme" were implicit throughout the recommendations, and this ecological theme appeared to be encompassing enough to include provisions to address global warming.

### Recommendations:

Throughout these recommendations we recognize as an underlying assumption that the ecological systems of the biosphere are resources to be conserved. Without due care, the long-term health of the biosphere could be irreversibly damaged. We must care for natural elements even though they may have no immediately apparent ecological role. We need an attitude of stewardship, which will act as a restraining influence on human activities, and will stem not simply from felt needs but from recognition that human beings are dependent on the well-being of the things and creatures around them. This kind of conservation may require some radical innovations in technology. For instance, population growth is recognized as a world problem, but some of the world's difficulties arise from an even more rapid growth in some kinds of technological systems, with consequent growing consumption of energy and raw materials, environmental damage, and production of wastes. We have to guard the natural environment against threats from ourselves. We have to be aware that cause and ultimate effect may be separated by decades and we have to learn to recognize as early as possible signs of damage. Our concept of nature must change from seeing it as a shopping basket of unrelated goods that we can consume at will, to a set of living ecosystems from which we may take only that part that does not threaten the continued viability of the whole.

Thus, although no specific recommendations on the ecological theme may appear explicitly, these considerations will be implicit throughout. (72)

Particularly relevant to the issue of climate change issue was the recognition that " cause and ultimate effect could be separated by decades" (72).

This report also emphasized a further significant feature that must be considered in any discussion of climate change — that is, "the carrying capacity or the regenerative capacity of the biosphere" " Much has been made of the implications of rising costs and, ultimately, finite limits to material resources, fossil fuels, and so on. There is another kind of limit, one with consequences at least as serious and perhaps more imminent. This is the carrying capacity, or the regenerative capacity, of the biosphere. A central thrust of the conserver approach is to promote techno-socio-economic processes that are in principle sustainable. From this follow a preference for obtaining our energy ultimately from "renewable" sources, and for methods of food production that do not 'mine' the soil. Not only do we look to the biosphere for these self-renewing productive processes, but we depend on it to assimilate, store, and digest the various waste effluents of industrial civilization. The consequences have been recently surfacing to make us more and more aware that for decades we have been releasing new chemical molecules into our environment at a rate that has far exceeded our knowledge of their potential effects. (3)

A crucial, still unresolved, aspect of social response to environmental concerns was explored—the linking of awareness of full environmental costs with the willingness to act:

Environmental problems will move from concern to action...When all costs of industrial processes are reflected in the prices of products, dislocation will be inevitable. Some commodities may be priced out of international markets. International cooperation and resource-environment treaties will become essential.

Most Canadians are aware of the problems caused by wasteful and thoughtless consumption. Many of them are willing to make personal choices that would help to redress this situation. They are waiting now for worthwhile opportunities to do so — and for the assurance that the appropriate technologies are at hand.... The need to come to terms with resource scarcity, environmental pollution and the associated social questions is, of course, not specifically a Canadian problem. (6)

#### Recognition of total costs

Much of the waste and excess that has characterized our 'consumer' culture has resulted from not taking the total costs of our actions into account. If the total costs — the true costs to others, to ourselves, and to future populations — could be seen for what they are, a conserver society would be an almost automatic result. (34)

To the extent that costs are externalized and become social rather than private, or are deferred into the future, prices are lower than they should be. With lower prices we tend to produce and consume more than if prices reflected all costs. (34)

We often do not know how to measure the costs we may impose on others or on the future by our careless housekeeping. They may be smaller than the costs we avoid, but they may also be much larger. For that reason, it is not always enough to depend on prices and the market system. (35)

Thus, people are willing to pay more for gasoline, and persist in driving large cars, in spite of the aggregate effect on the national balance of payments or on the cost of energy to future generations. (35)

When we ask just what we produce altogether, what are the total costs of doing so, and is it sustainable — whether we are paying as we go — we shall find some things we want to change. (35)

In this report the concern for moving away from specific energy sources reflected primarily their non-renewability, not their contribution to global warming, and it would appear that the term "sustainable" was used in some cases not in the sense of sustaining the environment but rather in sustaining the sources of energy.

#### Renewable energy

The aim of a conserver society will be to achieve reliance on sources of energy which are in principle sustainable over the long term. This will mean a preference for sources such as hydro, solar, wind, and vegetation that are in ongoing equilibrium with and are constantly renewed by the sun's energy.

This will contrast with present policies in the industrialized countries of maintaining high standards of living by drawing down the world's capital stocks of non-replaceable fossil fuels. (46)

Energy in its various forms has been given little consideration in economic theory. It has been used and wasted in vast amounts, without a thought for the consequences; depletion has been so rapid that it has caught us almost unaware. This once relatively hidden but important factor of production has erupted centre stage. It is now recognized to be the sine qua non of industrialization. (47)

But fossil fuels are a non-renewable resource. They are, in many respects, a capital stock. In the world of capital goods which can be replaced, methods have been devised to ensure that capital stocks are replaced as they are used up. In the case of fossil fuels, however, we have been drawing down a capital stock with little thought to ensuring that the service it provides can be maintained in perpetuity. The service provided by non-renewable fossil fuels is, of course the work that is accomplished as the energy transformation process takes place. The rates of depletion have been so great in recent years and new finds have become so infrequent that we can no longer avoid recognizing the finiteness of this capital resource. We are coming close to being able to calculate just how much longer it will last. (47)

"Sustainable" was also used in other cases to reflect concern for sustaining the environment. Although the report did call for eventually moving away from non-renewable sources, it did not call for phasing out development of fossil fuels. The report, in its quest for renewability, appeared to embrace the "breeder reactor", without seriously considering the military or ecological implications of continuing to promote nuclear energy:

Until these renewable sources become firmly established and provide a major share, present plans to open and develop new supplies of fossil fuels and electric power will have to continue (present uranium fission nuclear reactors are generally regarded as a 'temporary' or 'bridging' source; at this point in time, along with the U.S. the U.K. and Sweden, we should leave open for choice the extent to which we will become dependent on the longer-term 'breeder' reactors and/or thorium-cycling reactors, with the fuel handling and re-processing they will entail). (46)

## **2.2. Regulations and risk analysis**

In the 1977 Report, *Regulatory Processes and Jurisdictional Issues in the Regulation of Hazardous Products in Canada* by Bruce Doern, an important element in the dynamics of social debate around atmospheric risks such as climate change was identified: the call from potential contributors to the problem for more research into the causal connections as a means to delay action and as a justification for inaction:

## Industry

The question of hypothetically is one important feature of the political economy of the regulatory process surrounding hazardous products, but it is clearly not the only issue in the relationship of knowledge, science, technology and regulation. Who does the research and how independent it is perceived to be, the general advocacy of better processes of technology assessment, the need for basic research, the need for better or new applied technologies for monitoring and compliance, and when the call for more research becomes merely an excuse for not taking action, are all important issues on which some comments are essential. (29)

They [industry] cloak their arguments in the politics of research by arguing almost ritualistically that there is insufficient causal knowledge or that the technology is not available. (156)

This report also recognized that hesitancy on the part of scientists had been used by opponents to the regulations that might address issues such as global change as a reason for inaction or for more relaxed standards:

In many areas of the regulation of hazardous products and substances, lack of research is not the main problem. A very normal conflict emerges in this regard. Scientists, for example, are naturally and necessarily cautious about the statements they make about causal knowledge. They have a more cautious sense of evidence about standards of TLV's (threshold limit values) for example. They are likely to advocate, therefore, that the standards be viewed as guidelines and that more research needs to be done. Economic interests will exploit this argument and use it to justify looser standards or to postpone action until more conclusive cause-and-effect evidence is produced. Unions and others who must seek more precise administrative and legal criteria of evidence will opt for precise legislated standards. (29)

It is interesting to note that at the same time these publications — calling for serious transformation of society, and the implementation of regulations and standards to protect the environment and health — surfaced from the Science Council, a Socio-Economic Impact Analysis (SEIA) program was instituted by the Government of Canada. This program was later described in 1981 in the following way:

"In December, 1977, The Socio-Economic Impact Analysis (SEIA) program for major proposed health, safety, and fairness (HSF) regulations (economic regulations are excluded) was jointly announced by the President of the Treasury Board and the Minister of Consumer and Corporate Affairs, and came into effect on 1 August 1978" [cited in 1981 in *Scientific and Technological Controversy in Federal Policy Formation*, Science Council of Canada, G Bruce Doern] It was a more particular response to the growing criticism, primarily by business interests, of growing government regulations; a criticism strengthened by the declining state of the economy and increasing rate of inflation. (34)

### 3. Phase 3. (1978-1983)

#### 3.1. Energy

In the 1979 Council Report, *Roads to Energy Self-reliance*, all previous concerns for the environment appeared to have been dropped. In the introduction, this report made no reference to *Canada as a Conserver Society* (1977) — other than a questionable interpretation in a footnote — or to Knelman's *Energy Conservation* (1975). It did, however, select Report 23, *Canada's Energy Opportunities* (1975), claiming that this report "set the framework for such discussions [energy matters]. It also referred to *An Energy Strategy for Canada*, (1976) published by the Federal Government, which "identified self-reliance as central to any future energy policies, of which important components would be the urgent need for conservation and the development of renewable energy sources" (p.9).

Throughout this period, indeed, not only was there no reference to climate change but there appeared to be less commitment to the environment in general.

The response in this report to uncertainty was quite distinct from that in the other documents that called for precautionary measures. The focus of "uncertainty" was no longer possible impacts on the environment but the "uncertainty" of supplies.

Uncertainty is the greatest enemy of forward planning, both by industry and governments. It appears to be widening the credibility gap and generating social and international alienation. The energy "crisis" is one manifestation. To a large degree uncertainty constitutes the rationale for a national strategy and determines the selection of its instruments.

The basic concept underlying this Report is the postulated increase in the range of Canada's energy options. The main thrust is not to make rigid decisions, but — because of uncertainty — to advance a diversified and broadened supply options base, and thus providing, with greater confidence, more choices for future decisions. An important by-product will be an increase in the system's stability. In addition, an increased differentiation in accordance with regional characteristics and needs will be expected, and further implementation of renewable forms of energy will follow during the next century. (17)

Although "the environment" was included in the list of national goals, along with conservation and alternative options, emphasis rested on the continuation and strengthening of the status quo in energy production (including accelerated exploration for fossil fuel resources and revived interest in coal):

Any energy 'future' must be designed to support national goals — security, prosperity, social equity, health, the environment — within Canada's physical, economic, social and institutional constraints. While Canadians may differ on the specifics of 'how to do it,' there is growing consensus on the direction that energy policy should take. The major elements entering into these discussions are:

#### 1. Need for a major national energy conservation program

2. Increased substitution for conventional oil by alternative fuels
3. Accelerated exploration and continued production of national fossil fuel resources.
4. Improved and expanded utilization of electricity.
6. Renewed interest in and use of coal.
7. Expanded efforts in the renewable energy technologies, such as biomass and solar. (21)

It is also interesting to note the way in which the essence of the "Conserver Society" document was reported in this 1979 Report:

The Science Council, in the report on the economic and social implications of a conserver society, suggests ways to use our energy resources more efficiently (26)

Economic growth, level of industrial activity, regional development, equitable distribution of wealth, environmental impact and personal freedom of choice are inextricably involved. ...Notwithstanding the understandable desire to upgrade exports, it is probably in the national as well as the global 'interest' that an appropriate level of unit energy consumption, consistent with our socio-economic aims, and probably not very different from today's level will be required to preserve a socially acceptable quality of life.

Energy requirements are tied to economic and political aspirations. Canadians must keep all energy options open if these aspirations are to be fully satisfied. Economists, industrialists, financiers, politicians and other decision makers must understand that energy contributes to Canada's well-being, perhaps more so than in other countries (28)

### **3.2. Regulations and Environmental Assessment**

In the 1981 Council report, *Scientific and Technological Controversy in Federal Policy Formation*, G. Bruce Doern) there appeared again to be no specific reference to climate change. There were, however, significant references to generic environmental assessment principles that have implications for climate change.

#### Environmental assessment processes

In response to the pressures of the Canadian environmental movement and to the passage of the US Environmental Protection Act, the federal government established, in December 1973, the Federal Environmental Assessment and Review Process (EARP). EARP was created by Cabinet directive and has no statutory basis. Its purpose was to ensure that environmental effects and impacts were assessed and taken into account at the earliest planning stages of federal programs and projects. EARP operates in two phases. The first is at the departmental or agency level; agencies make the initial determination whether proposals or projects are likely to have significant environmental consequences. If so, then the second phase begins, namely a formal review of major projects conducted by the Federal Environmental Assessment and Review Office (FEARO). A panel of experts appointed by FEARO and the Department of the Environment undertakes a public review, including

hearings, of a detailed impact assessment document prepared by the proponent agency in accordance with guidelines specified by the review panel. Since 1974, EARP has reviewed several major federal projects but critics of the process point to several weaknesses such as its lack of legal influence and its purely advisory status. Much like the Ministry of State for Science and Technology in respect of science, EARP functions as little more than the 'ecological conscience' of the federal government, this authority being based more on moral suasion than on legal force.

The 1982 policy report of the Council *Regulating the Regulators*, contained an important examination of risk. In the earlier publication (*Policies and Poisons...1977*) a distinction was made between "risk assessment" and "risk adjudication." Throughout the 1982 report there is an important distinction made between the need for a "reasoned outcome of the assessment of risk" and the "negotiated outcome of the acceptability of the risk." This distinction was particularly important in the determination of risk in the context of climate change, and the potentially strategic use of scientific uncertainty.

When we began this study, matters of immediate economic concern to Canadians were much less pressing than they are today. Nevertheless, despite the present state of the economy, we emphasize the urgency of contending with value-scientific questions. Often it is too late to respond to the impact of advances in science and technology...the development of a 'proactive system' is vital (Bates, Introduction).

Science and technology have revolutionized the standard, quality, and style of living of most people. But many of the attendant costs were either hidden, ignored or not foreseen when a scientific advance was realized or a new technology was introduced. Along with benefits...we have seen environmental deterioration, depletion of non-renewable resources and stresses on the moral and ethical fabric of our society. (10)

The interaction between law and science at present is insufficient to allow anything other than a crisis-to crisis response. In the 1980s, technological advance is happening too fast for social and legal processes to adapt. (10)

" Many of the critically important modern problems which our society must today resolve — what I have called 'socio-scientific disputes' — are different in degree, and sometimes in kind, from those that our existing dispute resolution mechanisms were designed to handle"(Milton Wessel, cited on p. 10)

The complexity of the interaction of the two aspects [facts and values] contributes to the difficulty in resolving value-scientific disputes. (11)

One must also distinguish between scientific and value-scientific controversy. Scientific controversy is dispute over the validity of scientific findings or the completeness of a data base. Value-scientific controversy is dispute over the social, ethical and political implications of scientific findings and their uses.

Dispute over the interpretation of scientific findings bridges the two. Overlaps of these two categories are sometimes inevitable. In nearly every value-scientific controversy the science involved is also disputed, often because of its hypothetical and trans-scientific nature [trans-scientific describes hypotheses that cannot be verified experimentally for ethical or practical reasons, e.g., human experimentation to test whether certain compounds are cancer-producing] (12)

#### **4. Phase 4. (1984-87) Pre-Brundtland**

Reports during this phase to some extent form two streams: those which gave the environment or regulations primacy and others which gave the economy primacy. The policy reports, however, appeared to address primarily the need to give primacy to economic concerns.

It is interesting to note that the Science Council which organized the "Living with Climatic Change " Conference in 1976 has not again returned to the issue, even as late as 1987. To the extent that the Council deals in its policy reports with issues of sustainability in this period coinciding with the work of the Brundtland Commission, these were questions of sustainable economic growth in a more competitive environment, not ecological sustainability. The following excerpt was representative of the Council's apparent orientation during this period.

Canadian Industrial Development: Some Policy Directions. Report 37 (1984)

##### **Chapter 1: Obstacles and Opportunities**

All advanced industrial countries confront new situations today as the world economic order changes rapidly. Competition has heightened. Governments have displayed limited capacities to deal with their individual financial and economic problems in isolation, and the international situation has become very fragile .... the Science Council believes that the key to Canada's ability to move with the times is to establish a climate in which technological advances, innovation and new industrial companies can flourish. Initiatives must be directed to specific areas to stimulate and support the innovative process, provide better incentives for risk takers, heighten the commitment to research and development, increase the supply of trained technical people, and improve access to domestic and foreign markets. All levels of government can participate in helping to fulfill these goals and each should avoid legislative, regulatory or other actions that curtail their fulfillment. (22)

#### **Canada and the Challenge of Change in the 1980s**

In the early 1980s the global and domestic economies faltered. the extended recession and rapidly changing economic conditions left no country unaffected. Canada proved more vulnerable than most. In its evaluation of international competitiveness, the European Management Forum calculated that Canada's rank slipped from sixth to eleventh among 22 industrial countries between 1981 and 1982.

Broad financial support from the government is also needed to improve productivity and international competitiveness in Canadian industry, because many activities (notably R&D, investment in new plants and machinery, and development of international marketing skills) are insufficiently funded by the private sector. Moreover, because innovative activity tends to be risky, governments must offset risk to encourage innovation.... Government measures designed to influence industrial development are generally termed industrial policy, and a consistent set of specific industrial policies constitutes an industrial strategy. An overall strategy maximizes the benefits of industrial policy. The industrial policies chosen will decide the industrial structure.... Failure to make choices or to target activities such as R&D or the development of particular sectors would leave Canada's industrial structure at the mercy of random events and the short-term political whims and often predatory initiatives of other countries. (11)

A Canadian industrial policy should not, however, concentrate solely on a few high-profile successes. A number of traditional industries already involve considerable human and physical investment. Adjustment away from these activities would entail very high costs. It is in the national interest to upgrade sectors such as steel, forest products or automotive parts with new production technologies, provided that they can maintain or renew their international competitiveness. [It is interesting to note that both the forest industry and the steel industry are represented on the Science Council at this time]

**Phase 5 (1988-1992) Post-Brundtland. In this phase, the Science Council embraces the National Task Force interpretation of "sustainable development"**

### **Sustainable development**

In the 1988 statement by the Science Council of Canada, *Environmental Peacekeepers*, the concept of sustainable development as interpreted by the National Task Force on the Environment and the Economy was endorsed.

#### Summary

The deterioration of the planet's ecological base is accelerating. To a large extent, environmental deterioration in advanced countries is caused by unsustainable development, and in the Third World it is caused by crushing poverty that leads people to destroy the resource base. Science and technology offer a way out of both predicaments. In the advanced countries, new technologies promise to reduce demands on the resource base while increasing industrial competitiveness, and in the Third World, development is the key to relieving poverty and averting ecological disaster.

It is in Canada's long-term interest to respond to the global crisis by cleaning up her own backyard and addressing global issues through international organizations. Even in the short term, concern for the global environment could be rewarding. The early development and export of ecologically sound technologies could bring immediate profits to Canadian entrepreneurs.

The Canadian response to this crisis must include the integration of environmental and economic decision-making — what is referred to in Our Common Future as sustainable development. Canadian industries must adopt preventive technologies, which, unlike remedial technologies, offer opportunities to conserve our natural resources and reduce waste and pollution, as well as increasing productivity and competitiveness. The Science Council also recommends that science to measure and understand the state of the environmental resource base in Canada must be supported and organized. (p.7)

#### Recommendations:

1. The report of the National Task Force on Environment and Economy submitted to the Canadian Council of Resource and Environment Ministers be given top priority by Canadian governments and that steps be taken to implement its recommendations as soon as possible
2. The federal and provincial governments over a 10-year period take steps to put in place an environmental assessment capability in all departments, ministries, and corporations that through their policies and programs impinge directly or indirectly on the environment.
3. Between now and the beginning of the next century, Canada under the coordinated leadership of the federal and provincial governments, and with the commitment to sustainable development that emerged from the recent (June 1988) Toronto economic summit, double its efforts in support of the technological modernization of Canadian industry.
4. The Department of Industry, Science and Technology take a leadership role in promoting awareness of technologies for preventing or minimizing environmental degradation, and in encouraging and facilitating their development, diffusion, and application.
5. The Department of Industry, Science and Technology immediately develop and make operational an effective in-house environmental assessment capability for new and modified technologies.
6. Environment Canada and the Department of Industry, Science and Technology develop an Interdepartmental Working Group to ensure greater consistency in policies and actions in support of science and technology for sustainable development.
7. The Canadian Council of Resource and Environment Ministers appoint a task force, perhaps organized under the auspices of the Science Council, to identify the scientific and technological resources and infrastructure needed for the collection, overall coordination, and integration of reliable, credible, and publicly accessible data on the quality of ecosystems.
8. The Canadian Council of Resource and Environment Ministers support and organize the appropriate national science and technology efforts needed to deal with current and emerging ecological problems. (9)

#### • THE ECOLOGICAL CRISIS

The continuing and accelerating deterioration of the planet's ecological base poses a significant threat to the long-term viability of our world. Evidence concerning global warming, ozone depletion, species depletion and elimination, the spread of the deserts, forest destruction, soil degradation,

acidified lakes, rivers and streams, and groundwater pollution exists in abundance in the scientific literature.

Much of the evidence is subject to many qualifications and even scientific debate, but the overall trend and its gravity for our planet, to its multitude of species and to the generations to come, are beyond question. (11)

1. Consider, for example, the accumulation in the atmosphere of carbon dioxide, principally from the combustion of fossil fuels and the cutting and burning of forests, which is largely responsible for creating an invisible heat shield around the planet. The global average surface temperature is predicted to rise by between 1.5 degrees C and 4.5 degrees C within the next 50 years. [Worldwatch Institute, State of the World, 1988]

...It is not too difficult to foresee that dramatic consequences are possible in the next 50 years, in view of the fact that during the last ice age, when vast sheets of ice covered much of Europe and North America, the Earth's average temperature was only 5 degrees colder than the average today. (19)

Re: Our Common Future;

thesis that we cannot save the environment without development, and that we cannot continue to develop anywhere unless we save the environment. Thus, economic development must go on to avoid disasters in the poorest, most heavily populated countries, but must do so within ecologically sustainable limits. (11)

The role of science and technology in undoing the global ecological crisis — if it is to be undone at all — is of paramount importance. Because, to a large extent, science and technology narrowly applied for economic growth and development have created the crisis, they are frequently perceived as villains that destroy the planet's ecological base. But as this statement points out, science and technology can be heroes as well as villains: they can be applied to help prevent adverse environmental consequences of population growth and development, and to minimize demand on the planet's resource base. Science and technology policy is therefore central to the Canadian response to this crisis. (11)

#### THE CANADIAN RESPONSE

"The actions recommended in the Conference Statement [the Toronto Conference on Our Changing Atmosphere: Implications for Global Security]" if acted upon globally, could slow and eventually reverse deterioration of the global atmosphere. (11)

To be most effective in this leadership role Canada must set a good example at home. If Canadians are not prepared to tackle environmental problems that are solvable through our actions alone, such as the pollution of ground and surface water caused by our resource-based industries, who will pay attention to use when we broach problems that can only be solved through international collaborations? (12)

Even if that responsibility could be set aside, Canadians would be acting in a manner detrimental to their country's long-term good if they failed to arrest and reverse degradation of Canada's environment, including its resource base. Paradoxically, the very activities that have improved economic well-being in Canada have also had serious negative effects on our environment, particularly on our agroecosystems, forest ecosystems, and aquatic ecosystems. The Science Council observed in a recent statement for example, that '...soil degradation is an ongoing insidious problem that occurs in all parts of the country at a cost of over \$3.0 million per day or \$1.3. billion annually. Canada's resource-based industries, despite erosion of their competitive power, could go on playing a key role in the Canadian economy for many years if degradation of the Canadian environment is arrested and reversed. (12)

## **6. Summary Observations on Issue Framing as Seen in the Policy Reports of the Science Council of Canada**

The most striking feature to emerge from this extended review of selected publications of the Science Council of Canada is the extent to which an initial concern for the environment and the integrity of the biosphere became submerged in the economic concerns of the late 70's and eighties.

From an initial emphasis in general on environmental issues at the time of its formation in the late 1960's, the Council published a fairly full account of potential impacts of anthropogenic activity on climate change, emphasizing the question of global warming in 1972, and moved on to organize the 1975 *Living with Climatic Change* Conference, publishing the proceedings in 1976. In 1977 in its major program on the Conserver Society, the Council documented the underlying structural features of economic organization which account for otherwise inexplicable environmental degradation, focusing on the misleading price systems, incomplete market mechanisms, inadequate structures of property rights and distorted accounting systems which drive economic decisions and industrial activity. Thereafter, the risks of global environmental change, and particularly atmospheric change, drop from view in the wave of publications responding to the new social enthusiasm for privatization, deregulation and downsizing government. Environmental concern resurfaces in Science Council documents in the aftermath of the Brundtland Commission, but then primarily in respect of Canada's opportunities to find a competitive niche in the production of environmental technologies and services (although the Council does embrace strongly the National Task Force's conclusion on institutions and decision-making directed toward environment-economy integration).

Thus, the Council brought the relevant science into public view early, but seemed to drop out of the public debate on global warming when its own competition for survival in the leaner and meaner world of government restraint and manufactured recession became more acute. In that world, innovation, technology and competition emerged as concerns that dominated long term risks of global climate change, and that domination was amply reflected in the Council's own work. **1993 (March) Prepared a Report Card on the BC governments compliance with the Framework Convention on Climate Change on the occasion of the coming into force of the Convention 1993 Modified, extended and circulated Climate change report card**

- **1993. Created a Composite diagram on "Climate Change: identification of issue, response, evaluation, monitoring, enforcement" linking information from 8 different countries. A follow-up to a project based in**

Harvard on Social Learning related to climate change. 1993 (March)

Prepared for the International Law and Obligations Institute (project) a Report Card on the BC governments compliance with the Framework Convention on Climate Change on the occasion of the coming into force of the Convention

In 1967, in the Proposal for an intense neutron generator

“Specialization in areas of basic national need or significance, with dedication to a standard of excellence in the chosen areas, is not only the best way to challenge our scientists and engineers, and keep them in Canada, but is also the way to ensure the greatest long-term returns to the economy.” (p. 3)

Bohm, David

"Fragmentation and wholeness are especially important to consider today. Fragmentation is widespread, not only throughout society, but also in individuals, in science, and in all human activities. It is creating a general confusion of the mind, leading to an endless series of problems that have no solution. This in turn interferes with our clarity of perception and prevents us from confronting issues properly. One can see that society as a whole has developed in a very fragmentary way, broken up as it is into nations, ideologies, religious groups, industrial groups, professional groups, and countless ethnic groups, each one of which treats itself as independent. The natural environment has also been broken up into various bits, each exploited independently." (p. 7)

Science has become a very important source and sustainer of fragmentation in modern times, though its aim is unity. Physics has become the pattern or the paradigm aimed for by all sciences. In physics around the time of Newton, they developed a mechanistic approach by which the world was effectively regarded as made up of atoms — separate fragments, each with its own existence. Each one moving mechanically, interacting according to predetermined laws of force. The parts were the ultimate reality. They were fixed into relationships. Any whole was only the convenient way of looking at the parts collectively because it had no independent reality. Now this fragmentation introduced a certain unity, for all the world was made of similar atoms with certain universal relations between them. So, from the beginning it was step towards unity. (9)

Other areas of physics such as relativity and quantum theory have also denied this fragmentary, mechanistic approach. In relativity, there is no need to discuss atoms at all. We have to change to a concept of a field which is a continuous state which spreads throughout all space in waves. (10)

Quantum theory goes much further than that. It would be very hard for me to explain its subtlety, particularly since it isn't fully understood yet. But there are several new features of quantum mechanics. One is that movement, energy and momentum are no longer continuous as classical physics says. There is movement in discrete steps, so that an electron is said to jump from one orbit to another without passing in between. All energy is transferred in discrete quanta that are not analyzable. This already implies the indivisibility of the universe because all parts of the universe are interconnected by quanta that cannot be divided. (11)

Quantum mechanics in that way alone brings about this unity. And secondly, it brings it about in other ways. It says everything is both wave-like and particle-like. It is more wave or particle according to the experimental environment, rather like an organism whose behaviour depends on the environment, rather than a fixed mechanical system. (11)

Thirdly, there is another quality of wholeness in quantum theory due to a peculiar connection of distant things called non-locality, which means things that are distant can be quite connected. They are not necessarily connected by things that are physically close to each other. (11)

What this means is that our present knowledge of nature does not support this fragmentary view, but the opposite view. Nature is an undivided whole.

if we didn't have any other option as long as other options are available put nuclear energy on hold Knelman  
while you can never say never to nuclear energy considering the availability of alternatives which are more environmentally and socially acceptable, we should declare a moratorium on nuclear power plants. advantage is the advantage of conservation and efficiency program it buys the time necessary for exploration the development of renewable resources we could have the same economic output through half the consumption  
breeder program prominent in the 1970  
fission forever you start with regular fission then you recycle all the wastes plutonium special type of reactor that breeds  
finally, in all the time you develop fusion unlimited source. Knelman

Constraints and problems:

Studies approved by Environment Canada indicate that in B.C., the most prolific forest region of Canada, a 150 MW electrical generating plant could be operated on a continuous sustainable basis by rotation of cropping of red alder on an area of 65 square miles. (49) Conserver 1977

We predominantly measure throughput or flow, since it is a component of GNP, the widely used indicator for estimating economic well-being. From a conserver point of view, however, we would be better off to pay more attention to materials as stock, both fixed and circulating — fixed in the form of buildings, roads, equipment, etc. and circulating in the form of new investment, depreciation, recycling, consumption, and disposal. Thinking in terms of these categories we shall be able to promote economic welfare more efficiently — using materials more effectively, extending the life of scarce materials, and reducing the burden of increasing costs associated with finding, extracting, and disposing of large volumes of materials and associated wastes. (51)

Conserver, 1977

Many factors are now coming together to raise the costs of minerals, and are more likely to increase in intensity than to go away in the foreseeable future. These include the depletion of rich and accessible deposits, the increasing

size and complexity of mining operations, the difficulties of capital financing, rising cost of energy, transportation over greater distances, stricter environmental regulations, and insistence on regard for social costs and benefits, such as safety and health of workers and continuity of social infrastructure. Labour and exploration costs have been rising in Canada (51) Conserver 1977

Not the least among all these factors is the political element. Pressures are mounting for a new world economic order, one that will redress some of the imbalance between the developed and the developing nations; the industrialized nations draw resources from the less-developed and, because of their economic power, tend to get the better terms of the trade. As the UN agencies urgently point out a shift in the terms of trade is one of the best ways to assist the development of these countries, and if such a shift does not come about voluntarily it will likely be forced by various concerted political actions. (52) 1977 Conserver

The ultimate will be a change from a system of high extraction, high flow, and high disposal, with recycling a minor component, to a system in which optimal use is made of a fixed and recycling stock, with new extraction necessary only for growth, and 'topping-up' as materials degrade from wear and tear and mixing. 53 1977 Conserver

Since our forests, properly managed, are a renewable resource, Canada has the potential of developing a liquid fuels industry which is sustainable. 58

the net impact of such an activity on the Canadian environment would have to be considered and technical questions regarding the behaviour of water-methanol-gasoline mixtures in the cold Canadian climate await answers. A complete technology assessment of this technique will have to take into account all possible environmental costs, as well as determine whether production of methanol is the most energy-efficient use of wood and wood wastes. (58)

Our view is that renewable energy is feasible, desirable and inevitable; the rate of introduction, however, is a policy decision. This decision must be taken very soon if Canada, as a nation, is to make an orderly transition to renewable energy. (58)

by 1990 we could have between 1000 and 3000 windmills in Canada each with 200 kW capacity. (59)

Greenhouses

application of solar energy in green houses (60)

transmission of information electronically

Dramatic savings of energy and forests will be possible as new methods are put into practice for electronically transmitting to homes and offices the information we now find in newspapers, books and periodicals. (61)

## Decentralization of work places

The increased use of telecommunications should lead to a decentralization of work places and could foster structural changes in land use, places of economic activity and population distribution. (61)

**We have raised in previous sections of this Report the problems of rising costs from energy and resource depletion, and from environmental deterioration and how these costs come back on our decisions in indirect ways. (63)**

A second level of analysis would suggest ways in which transportation needs could be met by other systems having a lower demand for fossil fuels — electrified rail, for instance, or substitution of telecommunication for the physical movement of people or things. (64)

The story is well known of how General Motors took a leaf from the fashion industry and introduced the annual model change, changing the course of the auto industry. (65)

## Advertising in a conserver society

**More emphasis would be placed on information and less on persuasion. Greater attention would be given to life-cycle costing and less to initial purchase price. Product durability would be emphasized rather than fashion and trendiness. Throw-away products would be in disrepute, if they had not been priced off the market by energy taxes and disposal taxes. ...Human ingenuity and development would be directed to different problems than accelerating material consumption for its own sake. ... the scope for invention and enterprise in wresting a growing quality of life out of an in harmony with a limited environment would not diminish, though its challenge might be greater. (66)**

**While the mark of progress for the individual has been ever increasing possession and consumption of goods, the social infrastructure has also been expanding. ...Using tax dollars, governments at all levels have provided Canadians with a social infrastructure which may be too large, too costly and improperly suited to meeting the real needs of all citizens. (67)**

The bureaucratic isolation or impersonality of large systems can in itself be a cause of excessive demand. The user is apt to get the impression that services or goods provided by the system are in some sense free, or paid for by someone else. Irresponsible attitudes develop, leading to unnecessary consumption, waste and cheating of the system. (67)

Finally, there may be considerable excess capacity and waste that arises because some organizations in our society have the power to pass on their costs to others. Government departments may indulge themselves in lavish office space or padded personnel establishments. Universities, schools, and hospitals May — perhaps more in the past than now — splurge on expensive equipment. Large business corporations with power over a large segment of the market may feel secure in their ability to pass on large advertising costs to

consumers in the price of their products. Some of the most luxuriously appointed hotels and restaurants in our large cities were built to serve the expense account and convention trade. Labour unions bargain for and get their wage demands, because the industries that employ them will simply pass the costs along to the consumer, knowing that their competitors deal with the same union and will have to follow suit. The election campaigns of the various political parties hold out the promise of a better life for all. The government that finally gets elected then has to satisfy the raised expectations and in so doing, often runs a deficit. Prices and Taxes continually rise to pay for this every-growing "sheltered economy." Thus, we may have dimensions we are not fully aware of, what might be termed a "cost-plus' economy. (68)

A more-is-better philosophy has too often seduced us into thinking that more is necessary. More is almost always costly — economically and socially. Witty energy constraints, capital shortages, inflationary pressures and environmental limits coming to predominate, we are forced to consider less costly and, in many cases, different ways of satisfying the demands and needs of Canadians. (69)

The specific roles of industry in the regulatory process of each case...it is important to summarize several of the issues that influence the industrial perspectives; These issues include the profit motive, the role of sunk capital cost, questions of inter-firm technology transfer, the roles of industrial associations, the number and relative size of firms in particular industries, the degree of foreign ownership, and the influence of the company town 57)

The private corporation (and many Crown corporations, too) exist first and foremost to earn a reasonable return on investment for their shareholders. Occupational health (another) costs, unless they can be passed on to consumers, are ultimately an expense which reduces profit, at least in the short run. ...the private firm has a built-in bias to err on the side of less costly changes. (57)

Almost half of the emissions arise from gasoline engines, especially those utilized by motor vehicles. About 25% are accounted for by emissions from industrial and commercial stationary fuel combustion sources from utilities, and from power generation. another significant amount arises from industrial and municipal solid waste disposal from petroleum refineries and nitric acid industrial processes. (130)

The industry consists of thousands of firms, including a significant proportion of public or state enterprises (especially power generation). The firms range in size from industrial giants like INCO and the oil companies to very small firms, and are distributed throughout the 10 provinces. (130)

Through a process of industrial task forces and federal-provincial committees, a national air quality objective for nitrogen dioxide was established in the early 1970's. There was virtually no union involvement and only limited involvement by consumer groups. 130

The behaviour of some firms has been inexcusable on any grounds, but there are clearly some difficulties for industry-wide responses. Governments usually have to regulate on a across-the-broad basis. They cannot usually have different regulations for different firms (although they have certainly been known to adopt different compliance schedules for different firms). 157

#### 1977 risks

" The ways in which a risk is detected and appreciated are diverse. In some cases, there may be slow unfolding of medical and toxicological information on a world-wide basis, as for asbestos. (28)

"Perception of hazards is continuously being refined and extended. The question of whether low levels of lead in the blood of a pregnant woman. (28)

" The decision as to what level of risk is acceptable is necessarily a task for a group of people with a wider perspective than those involved with a regulatory agency and with the scientific and technological aspects of the hazards. Views on the acceptability of a particular risk, if they are to command respect, must reflect a broad and deep contact with public opinion, as well as thorough knowledge of relevant technical innovation. (29)

Sir Brian flowers, former Chairman of the U.K. Royal Commission on environmental Pollution, told a workshop of the Science Council, in February 1977, that although the technical basis for the Sixth Report on Nuclear Power in the Environment contained no scientific or technical matters of which he had not been previously aware, the hearing of this evidence by the Royal Commission which included members drawn from different sectors of society, had changed his own view of the acceptability of the hazards of rapid development of certain types of nuclear technology. The Science council emphasizes that judgment of the acceptability of risk, especially if made on behalf of those who may be exposed to it by those who are not, is a complex process. (29)

"Discussion of the scientific background must take place in an open forum This forum should include those particularly affected by a hazard, labour and management in the occupational context, and all affected parties in the environmental context. (29)

the Science council recommends:

that a National Advisory Council on Occupational and Environmental Health (NACOEH) be established by statute, with the following mandate:

1. to designate hazards and be responsible that assessments of risks are undertaken and published in respect of any hazard it may designate
2. to be responsible for publishing recommended standards of maximum permissible exposure levels for Canada. (31)

We have stressed that NACOEH will have to make judgments in areas in which there is no scientific certainty. This can best be done in our view if there is openness of information development and exchange and an openness of process, whereby different interpretations of scientific evidence

can be publicly discussed or new scientific evidence can be placed in the public domain. Where interim standards are promulgated without public enquiry, there should be provision for an appeal process. (36)

We recommend that a medical record system be designed and proposed by the Department of National Health and Welfare. As an essential first step, this must include standardizing nationally the collecting of pertinent medical and occupational information, as well as standardizing an appropriate code for computer inputs. (38)

Doern, Bruce. (Oct. 1977) "Regulatory Processes and jurisdictional Issues in the regulation of hazardous products in Canada.

#### Oxides of Nitrogen

The reports on the scientific and medical aspects of oxides of nitrogen indicate that there has been much less medical and scientific concern about its direct and secondary effects on humans... the hazard is similar to lead insofar as it is diffuse and pervasive in nature, and is related to the automobile as the primary source of the pollutants. If anything, it is an even more diffuse pollutant than lead, since oxides of nitrogen occur wherever internal combustion occurs. (129)

the degree of attention by researchers and the degree of knowledge about the effects of exposure to oxides of nitrogen seem to be greater on the environmental side than on the workplace side, despite the fact that the earliest known populations to be at risk ...On balance more is known about direct environmental hazards than about direct workplace hazards, or about the secondary environmental effects in which oxides of nitrogen are linked to the formation of ozone. (129, 130)

#### **1980 post- conservative Brundland sustainability to sustainable development**

[It is interesting to note that there were significant additions to the membership of the Science Council at this time (it begins to take on the tenor of the current round tables — that is, with a few significant exceptions, moving away from the dominance of scientific researchers in its membership, towards increased representation from the resource sector).]

#### **APRIL NOTE I DISPLAYED THIS DIAGRAM and diagram on Human rights AT THE PEACE WALK IN APRIL**

#### *NOTE RESOLUTIONS AT THE 1993 BCEN*

1993 BCEN attended the BCEN meeting in Victoria . Spent most of my time in the Forest Caucus compiling recommendations made by members. I proposed that we should come up with resolutions based of the recommendations coming from the members. It was agreed and a committee was set up. I spent the rest of the time working on the resolutions with his committee. On the final day of the Forest Caucus meeting I had the resolutions printed up and transferred to overheads in order to

present them to the plenary of the Forest Caucus. No time was given to the resolutions. When there was the plenary session of the BCEN I went up to the microphone and started to read the resolutions. I was told that there could be no resolutions endorsed by the BCEN because it was a network and received funding on that basis. Subsequently at every BCEN meeting I raised the issue that the BCEN would be far more effective if they could issue resolutions.

I ran for steering committee and was tied with David for the position and I decided to back out. I also ran to be one of the representatives at the conference in PEI. I almost made it and ended up going because Bruce Torrie could not make it and I had been the next on the list. I decided to set up an international affairs caucus at the BCEN.

***BIODIVERSITY RESOLUTION PUT ON THE FLOOR BY DAVID  
B.C GOVERNMENT DRAFTS CLAYOQUOT PROPOSAL***

***THAT in APRIL 1993, I Presented Graphic synthesis of ethical principles, related to the Environment. Conference on Ethics organized by the Goethe Institute, UBC.***

**Met a German biologist, German biologist, Dr. Schutt gave an excellent presentation on Forests and biodiversity. I contacted him afterwards and got a statement from him condemning clearcutting STATEMENT. I used this statement in all documents that I wrote on forests and well as in the court cases related to Clayoquot Sound as an indication of "changing times." Supposedly an injunction according to .... Justice is not confined to the strait jacket ... but is an equitable remedy moving with time and circumstances.**

- 1993. wrote a position piece on "CORE (Commission on Resources and Environment)

( ) THAT on April 13, I circulated a comment on NAFTA, examining NAFTA within the context of international law

EXHIBIT

APRIL 13 1993

Report and suggestion for follow up paper

NAFTA: International environmental principles emanating from UNCED and economic constraints or Environmental provisions and economic constraints. Assessment of Environment Canada's analysis of the environmental implications of NAFTA

Concepts to examine that may be economic constraints:

**PROBLEM 1.**

**A state cannot establish a higher environmental standard of production and exclude goods that do not meet that standard of production, and cannot require the other states to live up to higher standards**

The following two sections appear to permit each state to establish as high standards as they deem necessary:

"Right to take Standards-related Measures" (Article 904,1)

1. Each Party may, in accordance with this Agreement, adopt, maintain or apply any standards-related measure, including any such measure relating to safety, the protection of human, animal or plant life or health, the environment or consumers, and any measure to ensure its enforcement or implementation.

"Right to Establish Level of Protection" (Article 904,2)

Notwithstanding any other provision of this Chapter, each Party may, in pursuing its legitimate objectives of safety or the protection of human, animal or plant life or health, the environment or consumers, establish the levels of protection that it considers appropriate in accordance with Article 907 (2)

Both the "non-discriminatory Treatment" and "Unnecessary Obstacles" appear to qualify a state's right to high standards

"non-discriminatory Treatment" (Article 904, 3)

Treatment no less favourable than that it accords to like goods, or in like circumstances to service providers, of any other country.

"Unnecessary Obstacles" (Article 904, 4)

No party may prepare, adopt maintain or apply any standards-related measure with a view to or with the effect of creating an unnecessary obstacle to trade between the Parties. An unnecessary obstacle to trade Shall not be deemed to be created where:

- a. the demonstrable purpose of the measure is to achieve a legitimate objective; and
- b) the measure does not operate to exclude goods of another Party that meet that legitimate objective.

Another constraint could be "disguised restrictions" (Article 712)  
"No party may adopt, maintain or apply any sanitary or phytosanitary measure with a view to, or with the effect of, creating a disguised restriction on trade between the Parties.

**PROBLEM 2 That there is a provision for respecting international standards. There are standards conveyed in commitments adopted in UN conference action plans and in obligations from legally binding conventions and treaties; but these commitments and obligations are ignored.**

1. Each Party shall use, as a basis for its standards-related measures, relevant international standards or international standards whose completion is imminent, except where such standards would be an ineffective or inappropriate means to fulfill its legitimate objectives, for example because of fundamental climatic, geographical, technological or infrastructural factors, scientific justification or the level of protection that the Party considers appropriate. (Article 905, Use of international standards)

In the section on Compatibility and equivalence

"1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the Parties shall, in accordance with this Chapter, work jointly to enhance the level of safety and protection of human, animal and plant life and health, the environment and consumers.

2. Without reducing the level of safety or of protection of human, animal or plant life or health, the environment or consumers, without prejudice to the right of any Party under this Chapter, and taking into account international standardization activities, the parties shall, to the greatest extent practicable, make compatible their respective standards-related measures so as to facilitate trade in a good or service between the parties.

Note that international standard is defined as "a standards-related measure, or other guide or recommendation, adopted by an international standardizing body and made available to the public, and "international standardizing body" is defined as:

a standardizing body whose membership is open to the relevant bodies of at least all the parties to the GATT, including the International Organization for Standardization (ISO), the international electrotechnical Commission (IEC), Codex Alimentarius Commission, WHO, FAO, ITU International Telecommunication Union (ITU); or any other body that the Parties designate;

ACTION: to advocate the inclusion of bodies that have embodied environmental provisions; UNEP, IUCN and to fulfill commitments adopted in conference action plans, and to discharge obligations in conventions, covenants and treaties.

### **PROBLEM 3: HARMONIZING OF STANDARDS TO LOWEST COMMON DENOMINATOR**

Article 713: International Standards and Standardizing Organizations

1. Without reducing the level of protection of human, animal or plant life or health, each Party shall use, as a basis for its sanitary and phytosanitary measures, relevant international standards, guidelines or recommendations with the objective, among others, of making its sanitary and phytosanitary measures equivalent or, where appropriate, identical to those of the other Parties.

[does this mean never below international standards?]

ACTION: ESTABLISH AN EVEN PLAYING FIELD THROUGH ALL THREE STATES COMPLY WITH COMMITMENTS AND OBLIGATIONS

**PROBLEM 4: LIMITED REFERENCE TO INTERNATIONAL DOCUMENTS ON THE ENVIRONMENT (NOTE NO MENTION OF RIO- unless in Annex 104, check in Annex 104); Note only reference is to "specific trade obligations" in the environment treaties:**

**[ACTION; TO OPEN UP NAFTA TO ENSURE THAT THE DOCUMENT IS COMPATIBLE WITH UNCED DOCUMENTS]**

**Treaties mentioned:**

- convention on International Trade in endangered Species of Wild Fauna and Flora (1973)
- the Montreal Protocol (1990)
- Basel convention on the Control of trans-boundary Movement of Hazardous Wastes and their disposal (1989)
- Annex 104-1 Bilateral and Other Environmental and conservation Agreements
  1. The agreement between the Government of Canada and the Government of the U.S. concerning the trans-boundary Movement of Hazardous Waste, signed at Ottawa, October 18, 1986
  2. The agreement between the U.S and Mexico on cooperation for the Protection and improvement of the Environment in the Border Area, 1983.

**\* See Annex 104-1 for other agreements**

Such obligations shall prevail to the extent of the inconsistency, provided that where a Party has a choice among equally effective and reasonably available means of complying with such obligations, the party chooses the alternative that is the least inconsistent with the other provisions of this Agreement.

**ACTION: note that there is the provision to add other environmental agreements.**

The parties may agree in writing to modify Annex 104.1 include any amendment to an agreement referred to in Paragraph 1 and any other environmental or conservation agreement.

**PROBLEM 5: PRIMACY IS GIVEN TO NAFTA OVER OTHER INTERNATIONAL AGREEMENTS**

NOTE: THAT IN ARTICLE 103, "Relation to Other Agreements, this agreement is given primacy

1. the Parties affirm their existing rights and obligations with respect to each other under the GATT and other agreements to which such Parties are party.
2. In the event of any inconsistency between this Agreement and such other agreement, this Agreement shall prevail to the extent of the inconsistency, except as otherwise provided in this Agreement.

Background:  
NAFTA

Perspectives and Actions

1. External Affairs

Documents:

North American Free Trade Agreement Implementation Act: The NAFTA Partnership. March 1993

Chronology:

Note: March 18. (1992). Canada provides Mexico with 1\$ million worth of environmental assistance. [what was the nature of the assistance]

September 17 (1992) Washington, D.C. — Environment ministers of the NAFTA countries agree to establish a Trilateral Environmental commission to explore co-operation on environmental issues.

November 3, 1993 the Canadian Environmental review of the NAFTA is released.

"North American Free Trade Agreement: Canadian Environmental review, October, 1992.

purpose;

to ensure that the NAFTA would be consistent with Canada's commitment to the protection of the environment and to sustainable development, as set out in the Green Plan, a four-point plan was adopted to integrate environmental concerns into each element of the NAFTA decision-making process.

1. ITAC environmental representative were appointed to the International Trade Advisory Committee, and to eight of the Sectoral Advisory Groups on International Trade (SAGIT). These important trade advisory bodies, which include 311 representatives from business, environment, labour and academic, report directly to the Honourable Michael Wilson,

Minister of Industry, Science and technology and Minister for International Trade.

the environmental representatives on these committees ensure that environmental considerations are taken into account when the ITAC and SAGIT prepare recommendations for the government

(Note; involvement of Sierra Club, and Pollution Probe)

Mid-march 1993 Trilateral talks begin on agreements on labour and the environment

2. Canada's standards negotiators were responsible for ensuring, among other objectives, the continuing right of governments in Canada to establish, to maintain and to enforce environmental standards that reflect Canadian conditions and Canadian priorities. The integration of environmental concerns in the negotiating process is a preventive approach. It sets a precedent that will be continued in future trade agreements.

## 2. Environment Canada

### 2.1.

### 2.2. Legal interpretation

John Fried. (943-2803) Specialist in legal interpretation of NAFTA

Preamble is strong on the environment but the preamble carries little weight.

No mention of environment in the "objectives John Fields said that the preamble sets the context but the environmental provisions would be stronger if in the objectives." The document would be a lot stronger on the environment if the environmental provisions had been placed in the "objectives section."

To do this the three countries would have to agree to open up the document again.

Up until now the countries have refused to do this. [However, with Mulroney and Bush gone, perhaps an argument could be made to open the document up and place the environmental provisions in the "Objective section." this could be better than having a separate parallel agreement on the environment.]

Body of text:

An important section

Note: Article 906 Compatibility and Equivalence

1. Recognizing the crucial role of standards-related measures in achieving legitimate objectives, the Parties shall, in accordance with this Chapter, work jointly to enhance the level of safety and of protection of human, animal and plant life and health, the environment and consumer.

Key issues:

extraterritorialism

National security (21-2)

Discussion of document:

The preamble is very strong. To a certain extent, it would appear that environment has primacy over employment: the preamble reads, "Create new employment opportunities and improve working conditions and living standards in their respective territories; and this is qualified by the statement " undertake each of the preceding in a manner consistent with environmental protection and conservation:

The preamble also calls for "the development and enforcement of environmental laws and regulations;

2. Environment Canada

3. NGO perspective (Elizabeth May, Sierra Club)

3. stances of environmental groups.

1. Pollution Probe "work with government on NAFTA"

2. Action Canada "reluctant to work with government"

3. Sierra Club "Use NAFTA to achieve environmental protection"

4. National Business Council

• Discussion with Tim Page, First Vice President

claimed that his position is that "environment is good for business"

gave me a copy of publication which he thinks best reflects the view of the National Chamber of Commerce:

— Canadian Chamber of Commerce. (1990). *Focus 2000: Achieving Environmental Excellence: A Handbook for Canadian Business*

• Discussion with Tim Reid, President

suggested that it would be important to have an environmental component at the next NAMI meeting.

## **Implementation of Agenda 21**

1. External Affairs

Arthur Campeau suggested that I contact Rob McCrae 995-2160, or Shirley Luchuk (996-2110) about the implementation of Agenda 21

Shirley Luchuk dropped off two documents

• a publication on the "economic implications of implementation of Agenda 21) recent publication by External Affairs.

• Unclassified report dated February 26 "Decisions adopted by the organizational session of the Commission on Sustainable Development)

Division of Agenda 21

A. Critical elements of sustainability (Chapters 2-5)

B. financial resources and mechanisms (chapters 33)

C. Education, science, transfer of environmentally sound technologies [safe] technologies, cooperation and capacity building (chapters 16, 34-39)

D. Decision making structures (Chapters 8, 38-40)

E. Healthier, Human settlements and fresh water (chapters 6,7 18, and 21)

G. Land, desertification, forests and biodiversity (Chapters 10-15)

H. Atmosphere, oceans and all kinds of seas (chapters 9, 17)

I. Toxic chemicals and hazardous wastes (chapters 19, 20, and 22) [atomic?]

Note: also suggested need to link with other UN conferences

Contact: suggested by Campeau; Rob McCrae (995-2160)

2. Ministry of the Environment

- initiation of group to work on UNCED, "Projet de Societe"

coordinator: Barry Sadler

founding groups: National Round Table, IDRC, IISD, CCIC, and ?

2. IDRC

Theo-Carole Foster 236-2305 is the principal contact for the Research related to the implementation of Agenda 21.

She was not able to see me; She left me a set of publications indicating the nature of research that they have been doing.

I talked to the public relations officer about the position that the IDRC is taking that environmental problems are primarily outside of Canada. I was referring primarily to the section on biodiversity.

It would appear that IDRC has divided UNCED documents into 5 themes

1. Technology and the environment

2. Biodiversity

3. information and communication for environment and development

4. food systems under stress

5. Integrating environmental social and economic policies.

4. National Round Table

Director J. Russel.

MAY 1993

JUNE 1993

PEI MEETING OF THE CEN ANTI-CHOICE RALLY ABOUT 300 STANDING ONE BY ONE WITH SIGNS WITH BLUE AND WHITE WITH ABORTION KILLS

- June 1993 Attended the CEN National meeting in PEI as one of the representatives from the BCEN. Attended sessions of the International Affairs Caucus and presented the Statement of Obligations for consideration. I revised the statement and received endorsement for the statement in the plenary.

**At this meeting there was a significant statement circulated by the Nuclear Awareness Project calling for the phasing out of civil nuclear energy. I attended several of the sessions on alternative energy.**

**Richard Grossman spoke at the plenary. He presented his proposal that I had supported at the conference in Eugene calling for the revoking of charters of corporations. Pat Moss who had not been an opponent of the Round Table and is in fact a member of the BC Round Table on the Environment introduced him. I raised the issue of the Round Table rather than being a forum for implementing a proposal such as his had become a glorification of Conflict of**

**interest by legitimizing corporate involvement in establishing policy and regulations.**

**[In 1993 In 1998, one of the members of the CEN who had attended the 1993 sessions on Genetically Engineered Foods and Crops had been at that CEN meeting, but had failed to raise a red flag notifying the environmentalist of the impending approval of GE products in Canada] I only found out in 1998 When I raised this issue with him later. He was furious and all but hung of the phone on me]**

**There was also a presentation by a representative from the Ministry of Environment who when discussing Environmental regulation seemed more concerned about the cost of the environmental regulations than about the cost to the environment of not having environmental regulations.**

**A representative from the Union spoke at the plenary and questioned the fact that the CEN was not a resolution making body. An issue that I had raised at the BCEN meeting in 1992. He pointed out that that is how the union wields power by being able to make statements on behalf of the Union.**

**A meeting was held after about the question of endorsement and procedures. For example, the policy exists within the CEN and within the Caucuses that when a statement is issued a proviso much be attached that states that this does not necessarily represent the position of all the members of the caucus. A perfect example of how ineffective the environmental movement has become. As usual it is a question of money. Governments fund networks not organizations that make resolutions [particularly resolutions against governments and industries] the environmental movement has sold its soul for government remittance. Has become a remittance organization.**

**I decided to raise the issue again of speaking with one voice. I proposed that the “hot spots” should be incorporated into a general statement endorsed by the CEN.**

**This RESOLUTION ENDORSED BY THE CEN  
NUCLEAR STATEMENT**

**Scientist Call to Action.**

**1993 Distributed a letter to the Concerned Scientists about how the nuclear industry was using the Scientists Call to Action to support the nuclear industry by the industry claiming that the Concerned Scientists Call did not include a call to phase out civil nuclear power**

- 1993 Distributed a letter to the Concerned Scientists about how the nuclear industry was using the Scientists Call to Action to support the uranium mining in Saskatchewan**

**PARIS JUNE 1993**

- 1993 Participated in an International Panel on “International Obligations: translating rhetoric into Action” from UNCED” at the**

**“Stopping the Destruction of the Earth Conference through Translating Rhetoric into action” Paris, France. Presented a paper at the International Conference “Stop the Destruction of the Earth” calling for the translation of international rhetoric into action**

- **June 1993 carried out a survey of institutional follow-up to UNCED interviewed representative from the IUCN, Business Council for Sustainable Development, GATT, UNCED info in Geneva,**

- **JUNE 1993. Attended the World Heritage Committee meeting at UNESCO and made an intervention as an "observer" from Canada on Canada's failure to discharge international obligations under the Convention for the Protection of Cultural and Natural Heritage. Attended the World Conservation Committee policy meeting of the United Nations Convention on the Preservation of Cultural and Natural Heritage (1972) UNESCO, and addressed the meeting on the need to reconcile the global obligation incurred in the preamble by states to preserve areas of universal value: that in the view of the magnitude and gravity of the new dangers threatening them, it is incumbent on the international community as a whole to participate in the protection of the cultural and natural heritage of outstanding universal value (Preamble, United Nations Conference on the Protection of Cultural and Natural Heritage”, 1972) and Article 4 in the body of Convention which gives states the sole power to designate heritage of worth.**

**COMMENT:**

I decided on the Monday before the “Stopping the Destruction of the Earth Conference” that I would go to UNESCO and attempt to discuss with a representative from UNESCO the discrepancy between the preamble of the Convention and the operative clauses of the Convention. I went to the information desk and got the numbers for different representatives and attempted to contact them. Everyone was busy. While I was talking to the receptionist about my concern that in Canada there was a failure to comply with the convention and that sites that should have been designated were not because of the control from the forest companies, a man came up and talked to me. He introduced himself as an Egyptian living in Argentina working for the UN secretariat. In response to my discussion with the receptionist he said it is so refreshing to hear a Canadian being honest about Canada. Canadians are always being high and mighty suggesting that Canada has never done anything wrong. I explained to him that I wanted to discuss the Convention on Cultural and Natural Heritage in particular the discrepancy between the preamble and the body of the text. He said I am going to the meeting of the World Heritage Committee meeting now are you not going to be going. Oh, yes I said and walked away with him. this was the first meeting of the Committee and it looked quite formal with the president and recorder and others of the executive on the platform and desks with country names on it. In the beginning there were general remarks and the Egyptian motioned across the room for me to speak. I rose and introduced myself as an observer from

Canada. He motioned for me to go ahead. I stated that I was concerned about the discrepancy between the preamble and the body of the convention and how in Canada there was a failure on the part of government to nominate significant sites because of the influence of the forest industries, and that the UN should be given the power of forced designation because many significant sites of universal value would be lost. I must have spoken for about 10 minutes I believe that I specifically referred to Clayoquot Sound. I sat down. Suddenly this woman at one of the desks leapt to her feet and pointed to me and said that woman is not the observer from Canada. Everyone laughed. I did not know that I had hit upon the key term "observer." The procedure was that there were 15 countries each year elected to the Committee and other signatories of the convention could send observers. Obviously, I was not an official observer from Canada. but because this was the first day of the meeting no one had had a chance to meet the official observers yet. After the meeting the women came over to me with a list of sites that Canada was going to be seeking heritage designation for. I saw no old growth forests and no significant areas in B.C. I raised this issue with her. That night I went to a reception put on by UNESCO and I met the president of the Committee, who seemed quite amused about what had happened and said that it had never happened before and that it was an extremely important meeting.

Brief case with CANADA + maple leaf on it.

PATHWAYS

#### DANGEROUS PRECEDENT DISCUSSION WITH MEXICAN DELIGATE

After a very interesting debate, the World Heritage Committee " a momentous decision to permit "cultural pathways" as world heritage site. the Pathway was the pilgrimage to St James de Compostella. What next?. The cultural pathway of the \...

After my conference on ... Stopping. I went again to the World Heritage meeting. I went early to ask the president if would be alright to audit the session with the understanding that I would not speak. I arrived very early and found the president with two secretaries preparing for the meeting. Suddenly there was a flurry of activity and he exclaimed that his cuff button had popped off. Given that this was a formal meeting he was concerned about his demeanor. Neither one of the women had a needle and thread on the spot and the meeting been to start in 5 minutes. Normally I do not carry a needle and thread but this time I just happened to have a spool of white thread and a needle. I offered to sew his button on and we went into an adjacent room. When the real observer from Canada entered the meeting room, she came over to me and said that she had been on the phone night and day to Harcourt and Mulroney about nominating the Tatshenshini as a world heritage site. At the meeting I spoke briefly with the representative from the IUCM Jim He said that the Clayoquot Sound had been destroyed too much to be designated as a World Heritage site. He had to rush off. I spent some time with the Government representative from Australia. He was going to present a recommendation coming from the Australian government for the preservation of a large network of old growth forests. I found out one way of persuading governments to put sites on a world heritage list was to work on a resolution

for the IUCN Annual General meeting so I decided to go and visit the IUCN in Gland Switzerland to follow-up on this.

• June 1993 carried out a survey of institutional follow-up to UNCED interviewed representative from the IUCN, Business Council for Sustainable Development, IUCN GATT, UNCED Info in Geneva,

**COMMENT:**

I went to the IUCN in Gland to speak to the representative more about I had talked with Jeff McNealy at the IUCN in 1993 he had indicated that the percentages had no basis in reality. I made an appointment to see Wendy Goldstein who had come to my session at ECO Ed. She encouraged me to become a member of the IUCN Commission on Education and Communication. So, I applied and left my application with her.

**( ) THAT in June 1993. I submitted a policy report on the role of industry in the follow-up to UNCED**

to UNCED. Policy report requested by the Hon Hugh Faulkner, former Secretary of State for Canada, and the then Executive Director, International Business Council for Sustainable Development. Geneva (45 pages).

1993 Submitted a Policy statements, "Policy Directions: Complying with the Role Envisioned for Business and Industry in Environmental Training." Policy report commissioned by Hugh Faulkner, Executive Director, International Business Council for Sustainable Development. Geneva (45 pages)

**REPORT TO BUSINESS COUNCIL FOR SUSTAINABLE DEVELOPMENT**

**JOAN RUSSOW**

Sessional Lecturer

Global Issues in Sustainability

Environmental Studies

University of Victoria, FAX 604- 721-7767

**INTRODUCTION;**

Although there were systemic constraints which prevented UNCED from fully addressing the urgency of the global situation, there were many significant acknowledgements and principles which emerged from UNCED. (See Annex 1 for suggested "Systemic Constraints Preventing Change,"). The UNCED Documents, such as the non-legally binding Agenda 21 and Rio Declaration were agreed to by consensus by the member states of the United Nations. Although Agenda 21 and the Rio Declaration are not legally binding, they hopefully will carry significant weight as "soft" law or as documents of moral suasion. Within these documents are a set of significant principles (see Annex).

In this report, I will examine principles from the UNCED documents, describe what some institutions are doing to implement these principles and make suggestions about where, I think, the Business Council could make a significant contribution.

## **1. COMPLYING WITH THE ROLE ENVISIONED FOR BUSINESS AND INDUSTRY IN ENVIRONMENTAL TRAINING**

### **1.1. LIMITED YET SIGNIFICANT ROLE FOR INDUSTRY IN TRAINING IN ECOLOGICALLY SOUND EMPLOYMENT**

In chapter 36 of Agenda 21, a very important distinction is made between promoting "education," promoting "public awareness," and promoting "training." It appears to be clear in Agenda 21 that non-governmental organizations, community-based groups, women's groups and aboriginal groups are called upon to assist educational authorities in reorienting education. The role of industry is ascertained to be limited to specific areas of business and industrial and training programs.

" Educational authorities, with appropriate assistance of non-governmental organizations, including women's and indigenous peoples' organizations should promote all kinds of adult education programmes for continuing education in environment and development, basing activities around elementary/secondary schools and local problems. The authorities and industry should encourage business, industrial and agricultural schools to include such topics in their curricula. The corporate sector could include sustainable development in their education and training programmes." Agenda 21, Chapter 36.5 I

In the section of Agenda 21 that addresses the "promoting of public awareness " industry is included not as the dispenser of "education" but as the recipient of needed education.

"Countries and regional organizations should be encouraged, as appropriate, to provide public environmental and development information services for raising the awareness of all groups, the private sector and particularly decision makers." (Agenda 21, section 36.10 c)

In the section of Agenda 21, that addresses the "promoting of training, an important role for industry is envisioned.

"To strengthen national capacities, in training, to enable governments, employers and workers to meet their environmental and development objectives and to facilitate the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know -how" (Agenda 21, 36.13 c)

The Business Council could make a significant contribution not by attempting to determine the philosophical underpinnings of Education, but in facilitating

the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know-how within industry.

*1.2. The Business council could promote "Principle-based education among its members"*

Here is an outline of a course I will be giving for teachers in the Faculty of Education on Principle-based education

ED B 408 Contemporary Issues in Education: Principle-based education

In 'principle-based education,' principles related to preventing the destruction of the environment, the escalation of war, the violation of human rights, the disregard for social justice and the perpetuation of inequity have been extracted from internationally endorsed documents. These internationally endorsed principles become the foundation for an educational program.

Often in "education about issues," in the name of objectivity, a "both-sides" approach is advocated. Issues are presented as reflecting different values, and because of the difference, opposing views are considered to be legitimately introduced. In this "both-sides" approach often students are encouraged to explore positions which may be in contradistinction to principles that have been endorsed by the global community. The justification for this "both sides" approach is often the need to counteract indoctrination through "value-based" education.

A distinction, however, could be made between indoctrination and principle-based<sup>1</sup> education. In indoctrination the values that are presented are usually those that comprise the belief system of the educator, whereas in principle-based education the principles around which the lessons are developed are drawn not from an educator's particular belief system but from international law.

In principle-based education, the foundation of the course is based on principles derived from international agreements, such as the following:

"Universal Declaration of Human Rights," International Covenant of Social, Cultural Rights; Stockholm Conference on the Human Environment; UN Conservation of Natural Heritage, 1972; Convention on International trade in Endangered Species of Wild Fauna and flora" (Washington), 1973; UN Charter of Economic Rights and duties of states 1974; OECD recommendations on the analysis of environmental consequences of significant projects 1974;"(the World Charter of Nature, 1982; Paris Convention for the prevention of Marine Pollution from Land-Based Sources Global Biodiversity Strategy 1986; Montreal protocol on substances that deplete the ozone layer 1987; Convention on the Rights of the Child 1989; Convention for the Control of trans-boundary movements of hazardous wastes Basel Convention 1989; the Caracas Declaration 1992; Biodiversity Convention, Climate Change Convention and Agenda 21, 1992 )

1 "Principle-based education" was introduced in 1985 in Russow, J. "A Method of teaching Human Rights;" In this publication, the concept of "principle-based issue education" and the method of "Issue-principal analysis" were introduced. In this publication, "the violation of Human Rights" was extended to include the destruction of the environment, the escalation of war, the disregard for social justice and the perpetuation of inequity.

In this course, the nature, the implication, the educational processes, and the implementation of principle-based education will be explored in the following way:

- through description of the philosophical underpinnings of principle-based issues education
- through documentation of fundamental principles that emerged from UNCED and from other international conventions, declarations, conferences and agreements (Russow, J. "200 + principles from UNCED documents: Implications for Global Action." 1992)
- through explanation of an approach to principle-based education. In this approach, the instructor begins with principles, and then, with the students, examines issues that emerge from these principles. The following is an outline of a range of possible processes that never to be followed sequentially.
  - Location of principle within "International principle interactive diagram"
  - Statement of principle
  - exploration of principle
  - emergence of issues within principle
  - actual cases related to principle
  - application of principle to actual cases
  - adjustment of principle in response to cases
  - hypothetical case analysis
  - application of principle to hypothetical cases
  - adjustment of principle in response to hypothetical cases
  - clarification of principle
  - determination of action to support principle
  - engagement in action
  - justification of action

After examining the issues emerging from the principles, the class expand, refine or extend the initial principle.

- through preparation of interactive international principal diagram. Through this international principal diagram students will be able assess which principles relate to issues have been globally endorsed, ratified, and enforced, which principles are globally endorsed and ratified but not enforced.

Also, through this diagram students will be able to begin to examine the problem of discrepancy between what is said and what is done. (Or between rhetoric and action) (See Russow, J and White, D. (1992) Ideographic mode of Analysis and Synthesis of Issues: paper commissioned by the Greater Victoria School Board)

- through a series of class discussions and lesson plans based on 'issue-principal analysis,' related to a wide range of local and global concerns. Thinking about the complexity and interdependence of issues will be encouraged, as well as the need to attempt to find tentative resolutions based on the full examination of the principles and issues.

- through experimentation with the following prepared materials

- a document containing a selection of fundamental principles that emerged from UNCED and from other international conferences and agreements, and a series of class discussions and lesson plans based on 'issue-principle analysis,' centered around these principles

- an "international principles diagram" which will expand on the diagram "what is or is not protected?" a diagram that was an integral part of "a Method of Teaching Human Rights"(Russow, 1985). Through this international principal diagram students will be able assess which principles related to issues have been globally endorsed, ratified, and enforced, which principles are globally endorsed and ratified but not enforced. Also, through this diagram students will be able to begin to examine the problem of discrepancy between what is said and what is done. (Or between rhetoric and action)

- a series of "'Cradle to grave, ' or 'life-cycle' Approach Dissemination Diagrams" on various industries. This 'life-cycle/cradle to grave' approach was fully endorsed by the global community in the Agenda 21 document at UNCED. Through these diagrams, students will be able to understand the complexity of the interconnections involved in the introduction of an industrial activity into an ecosystem, and thus the implications of engaging in a particular industrial activity. It is only when students can see the "cradle to grave" or "full life cycle" approach that they will be able to assess whether the introduction will or will not violate internationally endorsed and ratified principles. (See Uranium Cycle diagram)

- a series of interconnected computer graphic programs, which connect a series of complex charts of various issues. Through this program the students will be able to examine the complex interaction of global issues, and then through a graphic selection program access complex diagrams of individual issues. Through this series of interlocking diagrams, students will be able to appreciate the interdependence of issues, and the confluence of aspects within each issue.

1.2. The business Council could also be involved with developing course material for education of managers. Here was a course proposal that I co-developed with a professor in Public Administration for a course for MBA course on the management and the environment. (See Annex 2 for outline of proposal)

## **2. ESTABLISHING ENVIRONMENTAL PROVISIONS WITHIN THE CHARTERS OF INCORPORATION OF TRANSNATIONALS ALONG WITH THE POWER TO REVOKE CHARTERS IF THE CONDITIONS OF THE CHARTER WERE NOT BEING MET**

"to promote a 'culture of safety' in all countries ..." (Agenda 21, 7.60, Disasters)

Richard Grossman (1993), an environmental lawyer from the United States has traced the history of the granting of charters to corporations in the US. He indicates that

there was an early tradition in the United States for " citizens [making] certain that legislators issued charters, one at a time and for a limited number of years. They kept a tight hold on corporations by spelling our rules each business had to follow by holding business owners liable for harms or injuries and by revoking charters. (6)

The Business Council could initiate the introduction, in business charters, of environmental provisions which comply with principles from international documents, monitor the compliance with these principles and call for the revoking of charters if the provisions were not being complied with. The 1994 Conference on Public Interest and Environmental Law will be focusing on this issue.

## **3. ESTABLISHMENT OF CRITERIA FOR AND PREPARATION OF LIFE CYCLE ANALYSIS OF SUBSTANCES AND ACTIVITIES**

One of the principles enunciated in Agenda 21 was that there should be life cycle analysis. If this principle is to be acted upon, serious consideration should be given to a full analysis of the environmental impacts of each stage of the processing and production of substances.

Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits (20.20 e Hazardous wastes)

"[promote efficient use of materials and resources, taking into account all aspects related to life cycles of products.] 9.15 e

"risk reduction involves broad-based approaches to reducing the risks of toxic chemicals, taking into account the entire life cycle of the chemicals. "(19.45, Toxic chemicals)

" Governments and international organizations, together with the private sector, should develop criteria and methodologies for the assessment of environmental impacts and resource requirements throughout the full life cycle of products and processes." (Agenda 21, 4.20)

In the past few years many industries have adopted environmental policies. In some cases, these policies may include the full operation— life-cycle — of the industry and in other cases these policies are marginal to the full life cycle of the industry. A significant role for the Business Council could be to set up an independent arm's length body to carry out a full life cycle analysis of products, activities, substances etc. This life cycle could involve a full assessment of the environmental impact of each stage and of "all aspects" of production.

#### **4. ENCOURAGING PRINCIPLE-BASED DECISION-MAKING RATHER THAN ROUNDTABLE INTEREST-BASED DECISION MAKING**

One of the outcomes of the Brundtland report in Canada was that Canada institutionalized the multi-sectoral interest-based roundtable to make decisions about "sustainable development" or "sustainability— economic, social and environmental". It appears that this approach has only become prevalent in Canada and that Canada has been advocating the adoption this approach in the international sphere of decision making.

Although a multi-sectoral approach appears to be all-inclusive, its inclusivity depends on the nature of the sectors, on the selection process to determine the nature of the sectors, on who determines the nature of the sectors, on who is selected to represent the sectors, on the method of selecting the individuals representing the sectors, and on whether the sectors are interest-based or conceptually based

... Underlining an interest based multi-sectoral approach is the presumption that the best way to make decisions is through negotiated outcomes rather than reasoned outcomes (distinction made in Science Council publication, 1984, "Regulating the regulators") with each member functioning on the basis of self-interest. This model of decision making — in an arena of competing interests — often leads to the compromising of principles and possibly to the lowest common denominator. This model of decision making could also be described as the "manufacturing of consensus model" where each sector for practical and participatory purposes eliminates the extreme positions — the positions which could be more principled and could lead to a better overall decision.

This approach is based on the premise that "balanced" decisions will emerge through consensus within an arena of competing interests. One outcome of this approach is that this arena of competing interests could be seen to be in violation of "conflict of interest" legislation. For years those who have been seen to have a conflict of interest have been excluded from the decisions making process [from panels, juries, boards. The multi-sectoral interest-based approach appears to almost glorify conflict of interest.

In a conceptually based or principle-based decision-making approach the members are not participating because they have a particular vested interest but because they wish to arrive at an overall decision based on the highest tenable principles.

## **5. ADVOCATING THE NEED FOR PRECAUTIONARY, NOT ONLY MITIGATIVE ENVIRONMENTAL IMPACT ASSESSMENT REVIEW**

A precautionary review is one that attempts to prevent environmental degradation and cultural inappropriateness of a project by examining the potential environmental and cultural impacts of a project to determine whether the project should be allowed to proceed; the outcome of a precautionary review could be a decision to prevent the project from proceeding. A mitigative review, however, is one that attempts to lessen the environmental degradation and cultural inappropriateness of a project which has already been permitted to proceed; the outcome of a mitigative review would not be a decision to prevent the project from proceeding.

Throughout Agenda 21 there is reference to environmental impact assessment; in some cases, it is not clear whether preventive or mitigative environmental impact assessment is envisioned.

“Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences” (7.42 Settlement)

" Develop improve and apply environmental impact assessments to foster sustainable industrial development” (9.15 b. Atmosphere)

" Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the assessment of the impacts of relevant policies and programmed on biological diversity” (15.5 k Biological Diversity)

" Development of public education programmed directed at decision makers and the general public to encourage awareness and understanding of the relative benefits and risks of modern biotechnology, according to ethical and cultural considerations.” (16.16 b, Biotechnology)

In the following sections, it is clear that a precautionary environmental impact assessment is envisioned:

" a precautionary and anticipatory rather than a reactive approach is necessary to prevent the degradation of the marine environment. This requires inter alia, the adoption of precautionary measures, environmental impact assessments, clean production techniques, recycling, waste audits and minimization, construction and/or improvements of sewage

treatment facilities, quality management criteria for the proper handling of hazardous substances, and a comprehensive approach to damaging impacts from air, land and water” (17.22. Marine)

States, in accordance with the provisions of the United Nations convention on the Law of the Sea on protection and preservation of the marine environment, commit themselves, in accordance with their policies, priorities and resources, to prevent, reduce and control degradations of the marine environmental so as to maintain and improve its life-support and productive capacities.” (17.23 Marine)

To this end, it is necessary to

" Apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it;" (17.23 a Marine)

" Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment; (17.23 b Marine)

“ In order to promote and strengthen international cooperation in the management, including control and monitoring, of trans-boundary movements of hazardous wastes, a precautionary approach should be applied.” (20.33 Hazardous wastes)

"States, in cooperation with relevant international organizations, where appropriate, should ...b) encourage the London Dumping convention to expedite work to complete studies on replacing the current voluntary moratorium on disposal of low-level radioactive wastes at sea by a ban, taking into account the precautionary approach, with a view to taking a well informed and time decision on the issue” (22.5 Radioactive wastes)

" Governments should take the lead in establishing and strengthening, as appropriate, national procedures for environmental impact assessment, taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction” (20.20 e Hazardous wastes)

' Governments, according to their capacities and available resources and with the cooperation of the United Nations and other relevant organizations, as appropriate, should promote and support the integration and operation, at the regional and local levels as appropriate, of institutional and interdisciplinary groups that collaborate, according to their capabilities, in activities oriented towards strengthening risk assessment, risk

management and risk reduction with respect to hazardous wastes” (20.25 a Hazardous wastes)

See Annex 3 for an example government's failure to make the distinction between preventive and mitigative environmental assessment reviews.

### **7. Advocating the polluter pay principle even when it might require retroactive compensation**

In both the hazardous waste section and the solid waste section of Agenda 21 the polluter pay principle was advanced

“ Governments should include in national planning and legislation an integrated approach to environmental protection, driven by prevention and source reduction criteria, taking into account the 'polluter pays' principle, and adopt programmes for hazardous waste reduction, including targets and adequate environmental control” (20.20 b Hazardous Wastes)

“ Governments should ...(b) apply the 'polluter pays' principle, where appropriate, by setting waste management charges at rates that reflect the costs of providing the service and ensure that those who generate the wastes pay the full cost of disposal in an environmentally safe way ”(21.42 b Solid wastes)

The business Council could advocate that when it can be shown that through non-compliance with statutes, and acts industry has caused environmental harm, any request for compensation by industry should take into consideration past environmental costs. For example, section 60 of the Forest Act of B.C. provides for the suspension of tree farm licenses if the license holder, through non-compliance with the Act, has caused harm to the natural environment. Throughout B.C. environmentalists have been documenting and submitting evidence of non-compliance to the Forest Act. The Fisheries Department has documented evidence of violation by the forest industry of section 33 of the Fisheries Act. Yet, this section of the Act has never been enforced. The cost of the environmental harm that has arisen from non-compliance with the act should be taken into consideration when the forest industry requests compensations for areas withdrawn from their tree farm licence.

### **8. Questioning the exclusion of atomic wastes from "hazardous" wastes or dangerous material categorizations**

In Agenda 21, atomic wastes are not included in the section of Hazardous wastes. For years atomic wastes have been excluded from international documents addressing the production, transportation and disposal of hazardous wastes. This special status has very serious implications for example, in the recent ruling of the Court, re: the calling for an environmental assessment review of Nuclear armed and nuclear powered vessels, the judge was able to state that an order in council bypassing an environmental review of these visits under the Environmental Assessment Review Process, was justified because it did not violate any existing statute such as the Canadian Environment Protection Act (which does not include hazardous wastes under

hazardous wastes section). (See Annex 4, for a comment on the role of the IAEA as both a promoter and regulator of Atomic Energy)

Note also that atomic

Perhaps the Business Council of Sustainable Development could suggest that atomic wastes be included in hazardous wastes [along with the suggestion that nuclear energy should be phased out... I'm sure that would be a popular suggestion in France — I have heard that at least 6 of the civil reactors in France have cracks in them -- again hear say, contact John Carlier, vice president of the "Collectif Environ, a Dimension, Inter." Paris for details if you are interested, in "names and places" ]

## **9. Advocating the true assessment of Environmental costs**

In Agenda 21 there was several statements indicating the need to assess the true environmental costs.

“Adopt policies that minimize if not altogether avoid environmental damage, whenever possible” (7.42 a Settlement) social costs of environmental

[Continue research and other work aimed at developing methodologies and criteria for incorporating the social costs of the environmental and other impacts caused by industrial production, as well as the treatment and disposal of wastes generated, into the prices of the final products;] (9.15 d)

“...a lack of awareness of the environmental costs incurred by sectoral and macroeconomic policies and hence their threat to sustainability” (14.7 a. agriculture)

(It is necessary to (17.5 Marine) " promote the development and application of methods, such as national resources and environmental accounting, that reflect changes in value resulting from uses of coastal and marine areas, including pollution, marine erosion, loss of resources and habitat destruction

Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits (20.20 e Hazardous wastes)

It also appears that the need to assess the true environmental costs is also a preoccupation of the Auditor General of Canada [misplaced citation]

The Business Council could seriously consider advocating that its members be obliged to take into consideration and make available to the public the full environmental costs of the production activities and substances

## **10. ADDRESSING THE PROBLEM OF OVERCONSUMPTION; DILEMMA CAN BUSINESS/INDUSTRY STILL FUNCTION IN "ECO-EFFICIENCY" (HARRIS, TERM COINED BY BCSD) AND DISCOURAGE "OVERCONSUMPTION"**

Problem of the relationship between production and consumption is currently being addressed within the OECD. The Environment representative of OECD

also requested information related to over-consumption, and to alternative ways of reducing consumption.

In Agenda 21 there was several references criticizing current mode of consumption, unsustainable consumption or over-consumption [even though the US desperately tried, and in some cases succeeded in eliminating reference to "consumption"]. In one exchange in Rio the US Reilly indicated that over-consumption in the US contributes to needed development in the South. I have both the hard copy version of pre-Rio Agenda 21 with the bracketed sections — most of them at the instigation of the US- and the computer version of the Rio version. It is interesting to compare what was still included in brackets in New York and what was eliminated in Rio. The following statements are ones that were altered or eliminated in Rio:

[ one of the most serious problems now facing the planet is that associated with historical patterns of unsustainable consumption and production, leading to environmental degradation, aggravation of poverty and imbalances in the development of countries.] (4.3 Changing consumption patterns)

["Health and development are intimately interconnected. both insufficient development leading to poverty and inappropriate development resulting in over-consumption, coupled with an expanding world population, can result in severe environmental health problems in both developing and developed nations."] 6.1 Health

["While poverty largely results in certain kinds of environmental stress one of the most serious problems now facing the planet is that associated with historical patterns of unsustainable consumption and production, leading to environmental degradation, aggravation of poverty and imbalances in the development of countries"] ( 4.3.

[ Special attention should be paid to the demand for natural resources generated by unsustainable consumption and to the efficient use of those resources consistent with the goal of minimizing depletion and reduction pollution. Although consumption patterns are very high in certain parts of the world, the basic consumer needs of a large section of humanity are not being met. This inequitable distribution of income and wealth results in excessive demands and unsustainable lifestyles among the richer segments, which place immense stress on the environment. The poorer segments, meanwhile, are unable to meet food, health care, shelter and educational needs. Change consumption patterns will require a multi-pronged strategy focusing on demand, meeting the basic needs of the poor, and reduction wastage and the use of finite resources in the production process.} 4.5 note: section put in brackets by U.S. " States should pay special attention to

efficient use of natural resources consistent with the goal of minimizing depletion and reducing pollution. This would help countries to meet their people's food health care shelter and educational needs. The poor suffer from environmental degradation that can deepen the problem of development in particular as they struggle with agricultural problems and problems of health, hygiene which are endemic to the poor. At time environmental degradation caused by the consumptive patterns of others can intensify the environmental problem the poor face. Poverty is closely linked to environmental stress." (U.S Suggestion for alternative to 4.5)

The following are statements that were retained in the final Rio version:

- **Increase in global population**

"The growth of world population and production combined with unsustainable consumption patterns places increasingly severe stress on the life-supporting capacities of our planet. . (5.2, Demographic dynamics)

- **Extent of air, water and land pollution**

" In many locations around the world the general environment (air, water, and land), workplaces and even individual dwellings are so badly polluted that the health of hundreds of millions of people is adversely affected. This is, inter alia, due to past and present developments in consumption and production patterns and lifestyles, in energy production and use, in industry, in transportation etc. with little or no regard for environmental protection." (6.40, Protection of health)

- **Nature of inequity between "developed" and "undeveloped" states**

" In industrialized countries, the consumption patterns of cities are severely stressing the global ecosystem, while settlements in the developing world need more raw material, energy, and economic development simply to overcome basic economic and social problems." (7.1. Settlement)

- **Extent of environmental damage from waste accumulation**

" The environment is threatened in all its biotic and abiotic components: animals, plants, microbes and ecosystems comprising biological diversity; water, soil and air, which form the physical components of habitats and ecosystem; and all the interactions between the components of biodiversity and their sustaining habitats and ecosystem. With the continued increase in the use of chemicals, energy and non-renewable resources by expanding global population, associated environmental problems will also increase. Despite increasing efforts to prevent waste accumulation and to promote recycling, the amount of environmental damage caused by over-consumption,

the quantities of waste generated and the degree of unsustainable land use appear likely to continue growing.” (16.22 Biotechnology)

•**Unprecedented Increase in environmentally persistent wastes**

" Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally persistent wastes at unprecedented rates. The trend could significantly increase the quantities of wastes produced by the end of the century and increase quantities four to fivefold by the year 2025". (21.7 Solid wastes)

•**Consumptive patterns**

"Achieving the goals of environmental quality and sustainable development will require efficiency in production and changes in consumption patterns in order to emphasize optimization of resource use and minimization of waste. In many instances, this will require reorientation of existing production and consumption patterns that have developed in industrial societies and are in turn emulated in much of the world." (4.15 Changing consumption patterns)

"Measures to be undertaken at the international level for the protection and enhancement of the environment must take fully into account the current imbalances in the global patterns of consumption and production" (4.4 Changing consumption patterns)

" Developing countries should seek to achieve sustainable consumption patterns in their development process, guaranteeing the provision of basic needs for the poor, while avoiding those unsustainable patterns, particularly in industrialized countries, generally recognized as unduly hazardous to the environment, inefficient and wasteful in their development processes. This requires enhanced technological and other assistance from industrialized countries. ... "(4.8 c Changing consumption patterns)

" To promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity" (4.7.a Changing Consumption Patterns)

" To develop a better understanding of the role of consumption and how to bring about more sustainable consumption patterns." (4.7.b Changing Consumption Patterns)

It would appear that the consumption and development link has to be also examined in relation to "north" development, such as cash crops in "south"

The Business Council could give valuable assistance to OECD in their deliberations about "over-consumption"

## **11. CALLING FOR THE BURDEN OF PROOF FROM THOSE THE OPPONENTS OF AN INTERVENTION HAVING TO DEMONSTRATE HARM TO THE PROPONENTS OF THE INTERVENTION HAVING TO DEMONSTRATE SAFETY**

A version of the shifting of the burden of proof was delineated in the World Charter of Nature. UN Resolution 37/7 (1982) endorsed by all UN states except the US.

Section 11 b Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed.

## **12. PROMOTING ENVIRONMENTAL PROVISIONS IN TRADE AGREEMENTS AND DISMISSING AS INAPPROPRIATE THE EXCLUSION OF ATOMIC WASTES**

### **•Increased generation of nuclear wastes**

" Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste (as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. The high-level waste contains about 99 percent of the radionuclides and thus represents the largest radiological risk. (22.1. Radioactive wastes)

1. (GATT Working group on Export of Domestically prohibited goods and other Hazardous substances report by the Chairman of the working Group July 2 1991)

GATT

(GATT Working group on Export of Domestically prohibited goods and other Hazardous substances report by the Chairman of the working Group (restricted) July 2 1991)

[Note that the only country which did not agree to this document] was the U.S. The U.S. submitted a "communication" proposing the following changes"; the U.S. changes will be noted in Italics.]

Report by Chairman of the working group on Export of Domestically prohibited goods and other hazardous substances [ note linking with " non-transference of goods that are harmful to the environment or to human health] principle in Rio Declaration

At present, although the attached text has been generally agreed by delegations, the country [US] making the reservation remains unable to accept it without amendments.

## Decision on Products Banned or Severely Restricted in the Domestic Market

### Preamble

Desiring to further the objectives and principles of the GATT  
Having regard to the provisions of the GATT as they apply to the products covered by this Decision;

Desiring further to encourage the development of international rules on trade in products that are banned or severely restricted in the domestic market of a contracting party, as well as hazardous wastes, on the grounds that they are dangerous to human, animal or plant life or health, or the environment;

Desiring further to ensure that such rules do not create unnecessary obstacles to international trade nor duplicate the work of other international organizations;

Recognizing the need for complementary action in GATT regarding trade in products covered by this Decision, while taking into account the important contribution that is being made by international organizations which have competence in the areas concerned.

Noting the importance of notification, information exchange systems, prior informed consent procedures and certification systems developed by other international organizations in exchanging information and in assisting contracting parties in deciding whether to permit importation of the products concerned.

Recognizing that every contracting party must assume full responsibility for decisions regarding its own imports, but that the co-operation of exporting contracting parties may be necessary in cases where the importing contracting party's control procedures are not yet fully developed;

Bearing in mind that no contracting party should be prevented from taking measures to ensure the quality of its export products, subject to the requirement that such measures are not applied in a manner that would constitute a means of arbitrary or unjustifiable discrimination between contracting parties where the same conditions prevail, or a disguised restriction on international trade;

Mindful of the need for governments to pay the fullest attention possible to the protection of the environment;

Hereby decide as follows:

### Article 1

#### Coverage

1.1. for the purpose of this Decision

(I) A banned product means any product that has been:

- (a) prohibited from sale or use, including those cases in which prohibition results from expiration of the approved period of use; or
- (b) refused approval for sale or use; or
- (c) withdrawn from sale or use

(ii) A severely restricted product means:  
a product for which virtually all sales and /or uses have been banned but for which certain specific sales and/or uses remain authorized.

With regard to pharmaceuticals, this includes only those

- (a) which are approved and subsequently subjected to restrictions that excluded their use in a substantial proportion of potential target population of patients having regard to its safety, and /or
- (b) which contain a substance whose dangerous properties require extraordinarily narrow content limitations.

1.2. This Decision applies to products, substances and wastes (hereinafter referred to as " the products concerned") which are determined by a contracting party:

- (i) to present serious and direct danger to human, animal or plant life or health or the environment in its territory, and which for that reason are banned or severely restricted in the domestic market of that contracting party by governmental regulatory action, except:
    - (a) fissionable and radioactive materials; and
    - (b) arms, ammunition and implements of war supplied directly or indirectly to a military establishment
- Atomic wastes

## 11 CRITICISING LIMITED VIEW OF APPLICATION OR RELEVANCE OF AGENDA 21 AND OTHER UNCED DOCUMENTS

" It was clear that GATT Contracting Parties welcomed warmly the Rio Declaration and the progress that has been made by the UNCED in fostering further multilateral cooperation, and were determined that GATT should play its full part in ensuring that policies in the fields of trade, the environment and sustainable development are compatible and mutually reinforcing. (Agenda-21 follow-up Activities in GATT at its meeting on 14-25 June 1993)

Although GATT claims to "welcome" the Rio Declaration there are two principles in the Declaration which could have significant impact of trade which may not be that welcoming to the business community:

Precautionary Principle

" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).

Not-transferring-environmentally-harmful-activities or substances principle

States should effectively cooperate to discourage or prevent the relocation and transfer to other states of any activities and substances that cause severe environmental degradation or are found to be harmful to human health” (Principle 14, Rio Declaration)

The Business Council for Sustainable Development could assist GATT in understanding the implications of the two-above principle.

Also, in this document (Agenda-21 follow-up Activities in GATT at its meeting on 14-25 June 1993), it is indicated that the follow-up will consist primarily in addressing those matters raised in chapter 2 of Agenda 21 (trade liberalization— 2, intro, A; trade and environment supportive — 2, B; propositions and principles in 2.21, 2.22 (a), (b), (h) and (k). ... In November 1993, the Council of Representatives will hold a meeting devoted to this ... UNCED follow-up.

I have enclosed a list of almost 200 principles, not from Chapter 2, which are related to trade and environment. Perhaps the Business Council for Sustainable Development could bring to the attention of GATT before its November meeting, that there are many significant principles beyond chapter 2 of Agenda 21.

## **11. ASSESSING WHETHER PRACTICES THAT HAVE BEEN CRITICIZED BY ECOLOGISTS AND LAUDED BY RESOURCE INDUSTRIES ARE IN FACT ENVIRONMENTALLY AND ECONOMICALLY SUSTAINABLE**

5.1. Undertaking to analyze whether the current practices of logging are in fact environmentally and economically sustainable, and if they are not to seriously look into alternatives. (Business Council of Sustainable Development)

( ) THAT in 1993, I criticized the OECD COMMUNIQUE;

Contradictions "sustainable economies" "sustainable growth and employment" sustainable development” (not used "sustainable environment").

Council of the OECD met on 2 and 3 June 1993 at Ministerial level... and the following communique was released:

"Ministers are committed to a concerted strategy for growth and employment. It consists of the following planks, described in detail in this communique

... monetary and fiscal policies will exploit the opportunities that may exist...without jeopardizing the objectives of price stability and medium-term budget consolidation;

. structural reform policies, including labour market policies, will aim for vigorous, competitive and efficient development of

OECD economies, exploiting opportunities offered by technological progress and open international competition; ... intensive efforts will be made to continue to liberalize trade, to abide and further strengthen multilateral disciplines and as the first priority to achieve a substantial, comprehensive and balanced outcome of the Uruguay Round by the end of the year. which would be a very powerful contributor to bolstering confidence, growth and employment both in OECD Members and elsewhere.

Promoting sustainable growth and employment: the major challenge for the 1990s

YET

In the same communique the environmental policy is described as the following:

19. Genuinely sustainable development over the long term requires worldwide co-operation. OECD member countries intend, even in this period of economic downturn, to continue to play a leading role in the field of sustainable development, including in their commitment to follow up to the outcome of the United Nations Conference on Environment and Development (UNCED). They commit their governments to take effective action aimed at:

- achieving, at the national, regional and international levels, more effective integration and compatibility of environmental and all other relevant policies.

In this regard they welcome the overall progress made by the OECD in this field, including the programme of environmental performance reviews. Ministers ask the OECD to pursue its follow-up to UNCED, and in this regard, to consider the **feasibility of analyzing the relation between consumption and production patterns and sustainable development**; [ this phrase was highlighted by the Environmental representative (personal communication, June 28). the representative also indicated that OECD would be focusing on "over-consumption", and requested information]

-- More effective use of the variety of available economic instruments, in combination with regulatory and voluntary measures taking into account of national circumstances, to address global, regional and national environmental problems -- with the goals of cost-effective, viable results, including reduction of greenhouse gas emissions, through national and international agreed actions;

- promoting environmental protection through various forms of international co-operation, including relevant international legal instruments; and
- promoting national and international efforts in the development and diffusion of technologies aimed at protecting and restoring the environment.

### **Annex 1; systemic Constraints preventing change**

The following "systemic constraints," may have prevented the global community at UNCED from addressing the urgency:

- the continued willingness to enshrine the sovereign right to exploit natural resources.
- the unwillingness to move beyond sovereign barriers to international environmental governance
- the failure to recognize that the situation is so urgent that international environmental governance, standards and regulations have to be necessary
- the refusal of states to accept the rule of international law
- the reluctance to establish stringent international environmental standards and technological regulations
- the unwillingness of states to allow for a stringent monitoring program
- the reluctance to recognize that the urgency of the current global situation requires the summoning up of the international political will to move from "should" to "shall"
- the obsession with consensus which may lead to the lowest common denominator rather than striving through collaboration for the highest tenable principles
- the decision-making process being conceived as an arena of competing interests
- the designation of failure made by those states, institutions and individuals who do not even live up to the moderate principles established by consensus
- the reluctance to redefine what constitutes development in an ecologically sound way
- the unwillingness to redefine development in terms of ecologically sound practices; such as
  - (i) the degree to which a state has been able to integrate with the ecosystem through ecological sound practices causing its human activity to have little deleterious impact on the environment
  - ii) The degree to which there is an equitable distribution of resources
  - iii) the extent to which a state refrains from contributing to global ecological or military harm
  - iv) The degree of condemnation, and avoidance of over-consumption
  - v) the ability to minimize the human impact on the environment through stabilization of population
  - vi) the degree of compliance with the enshrining of positive rights (right to ecologically sound work, to food, to shelter as well as with negative rights)
  - (vii) the ability to live within the carrying capacity of the ecosystem; in which case the US could possibly be the least developed
- the stereotyping of countries into categories of "developed, underdeveloped, and developing" rather than designating behaviours and attitudes as being "developed, underdeveloped and developing";
- the simplistic distinction between North (environment) and South (development)

- the presumption that technological transfer should always pass from "North" to "South"
- the revelation of a problem and the presentation of a solution which could have more disastrous or equally disastrous consequences as the problem (nuclear)
- the continued justification and rationalization about the use of ecologically unsound practices in the guise of technological fixes
- the condoning of technological fixes suggested as solutions:
- the continued condoning of research and development into rectifying the harm done through ecologically unsound practices rather than discontinuing ecologically unsound practices (the Green Revolution syndrome)
- the presence and use of international short term economic provisions which justify the abandoning by sovereign states of high ecological standards. (Present in GATT regulations, and evident in Chapter 2 of Agenda 21 "Social and Economic Dimensions".,.)
- the reluctance of GATT to consider the applicability of any chapters other than Chapter 2
- the persistence of the situation whereby the power to prevent environmental harm or to preserve environmental heritage resides in those whose interest it is to benefit economically from the environment. and that in whose interest it is to benefit economically from the environment tend to ignore ecologically sound practices
- the persistence of the co-option, often through government funding, of groups, whose role should be to act as the conscience of the official decision makers
- the persistence of the situation where those who should be speaking out are constrained because of professional commitments, and where those who are willing to speak out are not heard because the press fails to report their statements
- the sanctioned use of "words of delusion" that either delude the public into thinking that what is unsafe, is safe, or delude the public into thinking that there is the political will to eliminate unsafe practices.
- the sanctioned use of loophole vague terms like "as appropriate" or of loophole provisions like without *prejudice to international trade principles*. For example, in the following section on consumption They should therefore review the purchasing policies of their agencies and departments so that they may improve, where possible, the environmental content of government procurement policies, *without prejudice to international trade principles*. (4.23, Consumption)
- the sanctioned use of the "notwithstanding clause" device. This device allows for the indulging in strong statements about deep concern and the need for significant change and then including a notwithstanding clause that negates the strong statement.  
" Implement, as a matter of urgency, *in accordance with country-specific conditions and legal systems*, measures to ensure that women and men have the same right to decide freely and responsibly on the number and spacing of their children and have access to the information, education and means, as appropriate, to enable them to exercise this right *in keeping with their freedom, dignity and personally*

*held values, taking into account ethical and cultural considerations.*

(3.8 j Combating Poverty)

- the sanctioned use of oxymorons like "the environmentally sound management of hazardous wastes" (20.22 Hazardous wastes) or "the promoting the safe and environmentally sound management of radioactive wastes" (Chapter 22 Radioactive wastes)
- the sanctioned use of term like "harmonizing" which usually leads not the highest tenable principles but to the lowest common denominator
- the reluctance to deal with essential issues such as the link between "Nuclear civil reactors and Nuclear Arms Industry" or the Link between Poverty and lack of universal "secondary" as well as "primary" health care system (3.6. e Combating Poverty)
- the reluctance to address the environmental degradation caused by military operations  
("Systemic Constraints preventing change," Russow J. & White, D. in progress)

### **1. 3. Some fundamental principles that would probably be agreed to by Environmentalists as being principles that should form the basis of Environmental education:**

- The ecosystem has inherent rights in itself beyond human purpose (Charter of Nature, 1982)
- the realization that the traditional consumptive patterns of development have contributed to poverty, to the inequitable distribution of resources, to over-consumption, to the violation of human rights and to the potentially irreversible degradation of the ecosystem
- the realization that the threats to the biosphere which sustains all life on this planet have increased in rate, magnitude and scale that inaction is negligent. The international community has enough information about the pending state of ecological irreversibility that it must act immediately.
- The ecosystem of which we are a part shall be protected and preserved; ecologically unsound patterns of development shall be condemned and the inequity of development must be addressed and rectified. The mandate to limit growth must prevail
- The precautionary principles shall be extended to require those who wish to intervene in the ecological commons to have to justify their intervention and demonstrate the safety of their intervention. The full environmental costs shall be considered in any proposed development project that may cause ecological harm

- Development activities that benefit the few while compromising the biological inheritance, and quality of life of the many must be condemned as being inherently and ethically wrong
- Most of the third world debt was accumulated as a result of development that was inequitable and detrimental to the ecosystem; remedial and restorative measures shall be undertaken to address the inequity and ecological harm. The third world debt shall be forgiven and redirected for the purpose of addressing inequity and of restoring the ecosystem. While all are responsible for improving environmental quality, those who disproportionately consume the majority of the Earth's resources and pollute the natural environment shall bear the bulk of the costs of ecological restoration and protection.
- States shall not have the sovereign right to exploit resources within their territories. All actions within states must comply with high international ecological standards
- International ecological standards shall be in place so that no short-term individual pursuit of self-interest, or short sighted national or international regulations (GATT) could jeopardize the environment. The purpose of these standards is to address the individual and multinational pursuit of self-interest and to prevent the consumption and exploitative use of the environment and not to penalize local communities that wish to function in an interdependent way with the ecosystem. The economic development necessary to eliminate poverty shall not be a mandate to abuse the environment for either short-term gain or economic growth.
- The international community shall condemn and shall disallow the exporting of products deemed to be unsafe in a state where there are advanced testing procedures to other states with less advanced testing procedures. No products or activities shall be transferred to other states if the transfer could cause harm to health or to the ecosystem.
- The continued build-up of the military complex must cease, and the use of military forces as a means of resolving conflict must be rejected. A radical reduction of the military budgets of the world must occur, and the funds released for ecological and humanitarian purposes.
- The decision-making process shall be clearly defined, transparent, accessible and equitable. Criteria in decision making shall be revealed, and the public and affected communities should be involved at the time of formulation of the terms of reference and throughout the process.

Solutions should strive for the highest tenable principles not the lowest common denominator. (Issue under discussion should be reflected upon for a prolonged period of time in order to achieve an optimum solution, rather than simply a compromise)

- Behaviour and attitudes rather than countries should be categorized as "developed, " "developing" or "underdeveloped". The contribution of those people who have been 'truly developed' in that they have succeeded in living in interdependence with the ecosystem shall be recognized and their advice sought

(Principles submitted to Canadian Environmental Educators for consideration. These principles were derived from Russow, "Composite Charter" July, 1992, from statements and contributions by NGO to the Earth Charter, at the Global forum, 1992)

## **Annex 2 Draft proposal for MBA course in Environment (pre-UNCED)**

### INTRODUCTION

Increasing awareness of the urgency of the global environmental situation has generated a frantic search for solutions. There have been pressures on governments, institutions, individuals and industries to constrain economic growth and to change unsustainable patterns of consumption and resource use. These pressures are multi-directional, both externally and internally derived. The response to these pressures has manifested itself in a) compliance response (an abundance of newly framed environmental laws and regulations at the international, national and local government levels), b) a self-regulatory response ("fox guarding the coop") (a proliferation of proclamations, declarations, charters, codes devised by industries to convey the impression that not external but only internal regulations are required); c) : technological fix response a plethora of new products and processes (reflecting a fundamental belief in the power of technology to solve all) that will rectify the harm created by ecologically unsound products or processes thus permitting the continuation of those unsound products and processes. d) "Mea culpa syndrome" response. (Public confessions by industry about how they failed to consider the environment in the past; confessions accompanied by resolutions to be ecologically prudent) ... (environmental accountability)

As the multi-directional pressures mount there will be a concerted effort to calculate the full environmental costs of not giving primacy to the environment in the decision-making process. The possibility of income-generating ecologically sound activity being more economically viable than some

traditional but ecologically unsound resource extraction activities must also be considered.

In the face of multi-directional pressures to act in an ecologically sound way and of multiple responses proposed as solutions, what might the role of the manager be? In the past the managers' role has often been reactive rather than proactive with the managers' actions demonstrating the clarity of hindsight rather than the wisdom of foresight. In the following outline, a series of 12 or so seminars on the nature of the multi-directional pressures, on the various approaches to address these pressures, and on the "systemic constraints" are proposed.

**1. PRESSURE FROM THE INDEPENDENT SCIENTIFIC COMMUNITY**

In this seminar we will examine the pressure from the independent\* international scientific community through its predictions of actual and potential environmental consequences. We will also address the problem that many regulatory decisions are based on non-arm's length research funded and carried out by industry or funded by industry and carried out by Universities. \*independent in that it does not have a vested interest in a particular industry

Publication from Royal Society of Canada, Global Conference, held in Kingston, June 7-9, 1991; Global conferences.

**2. PRESSURE FROM A MORE INFORMED ELECTORATE AND INFORMED ENVIRONMENTAL MOVEMENT**

In this seminar we will examine the pressure from a more environmentally informed electorate, and the need to recognize that the traditional role of governance is changing; the electorate no longer expects the elected officials to govern without public consultation.

The informed electorate expects to be able to influence and have input into the decision-making process. We will also explore the need to move from token consultation where the informed electorate is involved essentially after the decisions have been made to participatory mechanisms where the informed electorate is an integral component of the decision-making process.

### 3. a. PRESSURE FROM GOVERNMENT AGENCIES; REGULATIONS, MONITORING ENFORCEMENT

In this seminar we will examine the nature of the pressures reflected in international, national and provincial environmental legislation in place, and the need to eliminate the discrepancy between the rhetoric of laws and regulations on the one hand and the actions of monitoring and enforcement on the other hand. We will also discuss the need to revise and reform the basis and criteria for "environmental assessment reviews" and the need to change the onus of proof from those objecting to the proposal having to demonstrate harm to those proposing the proposal having to demonstrate safety, and the implications of shifting the onus of proof.  
and the infrastructures in place to enforce and monitor these laws and regulations.

### 3. b PRESSURE FROM NON-GOVERNMENTAL ENVIRONMENTAL ORGANIZATIONS TO FORCE COMPLIANCE WITH REGULATIONS

In this seminar we will examine the nature of the pressure from non-governmental environmental organizations and the need to recognize that often it is members of the environmental groups that have a less specialized but more integrated experience in environmental issues.

We will also address the need for managers to be informed about the extent of potentially harmful consequences that could result from each technology, process and product so as to be able assess the extent of the provisions that are purported to address these consequences. Bibliography: Enforcement, RBA

### 4. PRESSURE FROM GOVERNMENT-SPONSORED AND SUPPORTED PUBLIC HEARINGS, ROUND TABLES

In this seminar we will examine the nature of the pressures reflected in government-sponsored public access to the decision-making process, and the need to involve the public

at significant stages of the decision-making process such as at the time of the formulation of the terms of reference. We will also address the problem of informed public intervention versus obstruction and the problem of selection of the participants in government structured consultative bodies.???intervention {these consultative bodied are often weighted on the side of industry because the environmentalists are often perceived to be only one stakeholder, whereas the "exploitative" uses are perceived to have many stakeholders. (Consumptive versus non-consumptive uses). We will also assess the different decision-making approaches used within these consultative bodies, such as conflict resolution, resolution dispute mechanism, "principle-based decision making, " "highest tenable principle, " and the impact of the confrontational system evidenced by high profile environmental law suits.

#### Bibliography:

a content analysis of documents reflecting a) the composition of the boards, round tables etc., b) the mechanism for selecting the participants, c) the nature and time of the involvement in the process, and d) the willingness by government and industry to act upon the recommendations.

#### 5. PRESSURE FROM ASSOCIATIVE SEGMENTS IN SAME INDUSTRY AND ASSOCIATIVE INDUSTRIES

In this seminar we will examine the nature of the pressures from associative segments within the same industry and among linked industry, and the need for full integration of environmental concerns in all corporate policy and decision. We will also address the implications of an ecologically sound industry using as a resource, products that themselves were not produced in an ecologically sound manner

#### 6. PRESSURE FROM INSTITUTIONAL INVESTORS WHO WISH TO INVEST IN ECOLOGICALLY SOUND INDUSTRY

In this seminar we will examine the nature of the pressures for environmental change coming from investors who wish to invest in an ethical and ecologically sound way and the type of ethical and ecologically sound investment systems that are in place. We will also evaluate the criteria that is used to determine ethical and ecologically sound investment. [will evaluate the criteria that are used by investments companies to determine what constitute ethical investments.]

#### 7. PRESSURE FROM SMALL SHARE HOLDERS WITHIN INDUSTRY

In this seminar we will examine the nature and range of pressures from shareholders in the company, and the need to

make the shareholders aware of the environmental implications of current and proposed technologies, and processes involved in production. We will also address the need for shareholders to condemn the indulging in an end of pipe correction and to support the build-in-solution in decision making from beginning.

#### 8. PRESSURE FROM CONSUMERS THROUGH CONSUMER BOYCOTTS

In this seminar, we will examine the nature of the pressure from International, national and local boycotts of ecologically unsound products practices and processes. We will also explore the implications of advocating boycotts that could have a detrimental effect on an industry that is itself ecologically sound.

#### 9. PRESSURE FROM THE MEDIA

In this seminar we will examine the nature of the pressure from editorial comment, letters to the editor, position pieces and special features, and the need to analysis the ability of the newspapers to retain detachment in the light of the newspapers connection with industry. We will address the issue of the control of the media and the implications for objective reporting on the environmental issues that could jeopardize media interests; and the nature of the media influence in shaping public perceptions.

#### 10 PRESSURE FROM PERSONAL CONTACTS WITH INDIVIDUALS AND WITH COMMUNITY GROUPS TO WHICH INDIVIDUALS FROM INDUSTRY BELONG

In this seminar we will examine the nature of the pressures from a range of categories of individuals, institutions, service clubs etc. to which individual members of industry belong.

We will also address the power of special interest groups and lobby groups who influence industry from behind the scenes.

Bibliography:

#### 11. PRESSURE FROM THE INTERNATIONAL COMMUNITY THROUGH INTERNATIONAL LAW AND TRADE REGULATION

In this seminar we will examine the nature of the pressure from international environmental standards and from international trade regulations and the need to ensure that established environmental regulations that may be perceived to interfere with the free flow of trade will not be sacrificed. We will also address the problem of international trade regulations interfering with high state environmental standards and the problem of low state environmental standards not being required to be raised to higher international standards.

## 12. PRESSURE FROM WITHIN CORPORATIONS

In this seminar we will examine the nature of pressure from within industry from upper, middle and lower management. We will also examine the accommodation of dissent in relation to the establish environmentally policy, and the role of the environmental whistle blower.

Bibliography: Public Administration documents

## 13. RESPONSE 1.

Improved information and analysis. Resource accounting: full environmental accounting; "polluter pay principle"; economic instruments and property rights. Cost benefit analysis revised to include valuation of natural capital.

## 14. RESPONSE 2.

Accountability to multiple "stakeholders"

## CONCLUSION:

Traditionally industry has had to contend with only bidirectional pressure and accountability to maximize profit for shareholders, and fulfill government technical regulations, now industry is having to confront multi-directional environmental pressures and accountability. Industry's response was initially to attempt to find loopholes in government laws and regulations, or to contest what appeared to be too high environmental standards; then industry entered into a response phase of reluctant compliance with government laws and regulations. Industry, because of a range of new pressures from consumers, soon recognized the need to appear "environmentally friendly"; this response involved a flurry of new environmentally friendly new logos, slogans and products. Soon industry, having to respond to a wider range of environmental concerns and realizing that eventually industry would be losing community support, recognized a new need: the need to appear "environmentally enlightened"; this response involved a flurry of environmental departments or sections within the industry, of declarations and charters embodying industry's commitment to the environment, and of a facade of environmental concern. As a result of all these measures an "environmental industry"

appeared. This industry was and is in place to provide environmentally-friendly technological fixes for the ecologically unsound practices that drive industry. In all the above responses the pressures were essentially external; even when pressures to change come from within industry by shareholders, employees, and different levels of management, the pressures in a sense could still be deemed to be external in that industry has not internalized the values that would be needed to have a truly ecologically sound industry. The internalizing of environmental values, including those of equity and social justice, would require industry to recognize the primacy of the environment. There would have to be a shift in language and a change in perception. The onus of justification would have to change from those objecting to industry's intervention having to justify why they object, to industry recognizing that industry's interventions cause to withdrawing from the environmental heritage of the commons and that industry must justify this withdrawal. It will only be when industry has internalized the multiple pressures, and is willing to accept the primacy of environmental safety and environmental preservation, and is willing to ground their actions in principle.

The transition from the bidirectional pressure to multi-directional pressure may be bringing about the dissolution of the traditional roles and responsibilities of managers. Managers whose line of responsibility was well defined within the traditional industrial unidirectional model, might find a new sense of responsibility to mult-idirectional complex, fluid, indefinable, indeterminate body of pressures from consumptive interest groups and non-consumptive commons concerns.

### **Annex 1 An example of failing to make the distinction between preventive and mitigative environmental assessment reviews.**

[The Canadian government has refused to undertake an environmental assessment review of the Kemano Completion project, even though the Canadian government has made an international commitment "to ensure that decisions [about projects] are preceded by environmental impact assessments" and "to take into account the costs of any ecological consequences (Agenda 21,7.42). Canadian Law has also committed the Canadian government "to carry out an environmental assessment review to determine if the potentially adverse environmental effect that may be caused by a proposal are significant (S.12, EARP).

The Canadian government has also refused to assess the environmental and cultural impacts of the Kemano Completion project on native communities, even though the Canadian government has made an

international commitment to indigenous people " to recognize that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate" {Agenda 21, 16.3 a (ii)}.

On January 19, 1993, Premier Harcourt issued a press release " Premier Announces Review of Kemano Completion Project". Premier Harcourt's statement was misleading because he did not make a distinction between a "precautionary" and a "mitigative" review. A precautionary review is one that attempts to prevent environmental degradation and cultural inappropriateness of a project by examining the potential environmental and cultural impacts of a project to determine whether the project should be allowed to proceed; the outcome of a precautionary review could be a decision to prevent the project from proceeding. A mitigative review, however, is one that attempts to lessen the environmental degradation and cultural inappropriateness of a project which has already been permitted to proceed; the outcome of a mitigative review would not be a decision to prevent the project from proceeding.

The terms of reference of the proposed B.C. government's public review of Kemano Completion are *not* to determine whether the project should proceed but to assess the options for mitigating impacts associated with the Project".

There is a significant distinction between undertaking to carry out an environmental assessment review of the Kemano Completion project to determine if the project should proceed, and undertaking a "public review" of the impact of the Kemano II project after the decision has been made to allow the project to proceed.

The Cheslatta Carrier nation, displaced by the Kemano I project, is advocating a review that, if carried out, would probably fully justify immediate mitigation of the impacts of the Kemano I project, and justify the prevention of the Kemano Completion project. In their proposed review, the terms of reference should include but not be limited to the following:

- a thorough investigation into all environmental, economic, social and cultural impacts of Kemano 1, and prescribe immediate mitigation;
- a thorough review of the terms, conditions and circumstances surrounding the granting of Alcan's 1950 Nechako Water licence including a thorough review of the 1949 water licence 'hearings' held at Wistaria and Victoria
- a thorough review of the 1987 Nechako settlement Agreement, including into terms and conditions and 'mitigative' measures, and the circumstances that led to this settlement
- a full disclosure of all federal and provincial documents and involvement relating to the Kemano projects;
- the commissioning of an independent cost/benefit analysis of the Kemano projects;
- the commissioning of an independent environmental impact assessment of Kemano 2;

- a throughout investigation into possible violations of the Federal Fisheries Act and the provincial Water Act;
- a through investigation into power sale contracts between Alcan and B.C. Hydro;
- an investigation into whether Alcan is a 'public utility';
- a through investigation into the impact of the reduced water flows on the Nechako River on the concentration of municipal agricultural and industrial effluent;
- a thorough investigation into the past and present management of the Nechako Watershed;
- a thorough investigation of Environcon Ltd and Triton Environmental Consultants Ltd. (April 1993, Cheslatta Nation )

If the proposed Cheslatta review were carried out it could result in the restoration of the environmental degradation of Kemano I, and in the redress for the cultural impacts of Kemano 1. Their review could also result in the prevention of the Kemano Completion project. As pointed out by the Cheslatta band the cost of compensation for any loss that Alcan may have incurred for its preparatory work for Kemano Completion will be far less than the cost of past (Kemano I) and future (Kemano II) environmental degradation and cultural displacement. Any public review that does not fully investigate the impact of Kemano and does not have within the terms of reference the possibility of preventing the Kemano Completion project from proceeding is making a mockery of the precautionary principle and of the public process.

### Annex 3

## **THE "NOT-TOO-HIDDEN AGENDA" OF THE INTERNATIONAL ATOMIC ENERGY AGENCY (IAEA) AT UNCED: NUKESPEAK, AND SEDUCTIVE DEVICES, DOCTRINES, DOGMAS, STRATEGIES AND FALLACIES**

By Fred Knelman and Joan Russow

Dr Fred Knelman is the Vice President of the Whistler Foundation for a Sustainable Environment, and Joan Russow, was the delegate for the Whistler Foundation at the New York Preparatory Committee for UNCED and at the Earth Summit at Rio. The Whistler Foundation and the Nuclear Age Peace Foundation had circulated a Declaration that was signed by 37 Nobel Laureates; this declaration called for the phasing out of Nuclear energy. They requested permission to read this declaration at one of the plenary sessions at Rio Centro; permission was denied.

The International Atomic Energy Agency (IAEA) was initially set up in the 1960's to regulate Nuclear energy; they have, however, become one of the strongest proponents of nuclear energy. A fundamental regulatory principle of the "separation of function" is that "the agency entrusted for regulating a technology cannot be the same agency that promotes the use of that technology"(Knelman, 1975). IAEA, through its UNCED document entitled "Nuclear Techniques and Sustainable Development." acted as a major proponent, not only of the current use, but of the increased use of nuclear energy.

Agenda 21-- the 600-page far-reaching action-plan document from UNCED, was adopted unanimously by the global community represented at the Earth Summit in Rio. In Agenda 21 the following concern about radiation was expressed:

The deterioration of environmental quality, notably air, water and soil pollution owing to toxic chemicals, hazardous wastes, radiation and other sources, is a matter of growing concern. (Chapter 16. subsection 12),

The extent of the consequences of the nuclear industry were also identified in Agenda 21:

Annually about 200,000 m<sup>3</sup> of low-level and intermediate- level waste and 10,000 m<sup>3</sup> of high-level waste (as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production.

These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. (Chapter 22, subsection 1)

Yet at one of the plenary sessions, Mr. Hans Blix, Director-General of the IAEA, was given permission to present a document advocating nuclear energy as being a safe alternative energy for the future. The International Non-Governmental Organizations, (NGOs), however, recognized that the fundamental regulatory principle had been violated, and gave IAEA, the dubious honour of being presented with the International NGO Community's "Most Preposterous Proposal Award" "for presenting nuclear power as the environmental solution in energy and successfully keeping its problems out of the documents".

We would like to highlight some of the SEDUCTIVE DEVICES, STRATEGIES, DOCTRINES, DOGMAS and FALLACIES that have made the IAEA worthy of this honour. The examples will be drawn from IAEA document which was prepared for UNCED. Also references will be made to other UNCED Documents such as Agenda 21 and the Rio Declaration-- the Earth Charter-- 1992, and the Canada's National Report for UNCED, 1992

The seductive devices, strategies and fallacies used by the IAEA all draw upon the fundamental language of 'nukespeak'. Knelman (1986, 1992) has expanded on the euphemistic nature of Nukespeak: (Term first used in Hilgartner S, R. Bell, and R. O'Connor 1982)

"The rule is sanitizing by euphemism: political euphemism is of course older than nuclear power. How many of us recognize the "elimination of unreliable elements"? There are forbidden words in the language of civil nuclear power. For example, the words "accident", "pollution" or "disease" are never used. Accidents are either "transients", "events", "significant events", "anomalies", "occurrences" or "abnormal occurrences". In the extreme, they

become "normal abnormalities", i.e., truth becomes lies. Explosions are "events of rapid disengagement" or "prompt criticality". Waste dumps are "residue areas". Thermal pollution becomes "thermal effects" and pollution becomes "impacts". Disease becomes "health effects". This is a euphemism for cancer and genetic malformations. And missing plutonium, which is the link to clandestine acquisition of nuclear explosives is "material unaccounted for" or simply MUF! (Knelman, 1986.) Other names relating to nuclear accidents are criticality, nuclear excursions, abnormal evolution, normal aberration, plant transients, unnecessary ignition sources. "Nuke speak" is perpetuated through "nuclear acceptance campaigns" by the PR departments of the nuclear establishment, designed to find "palatable synonyms" for "scare words" through the use of "truth squads" in order to remove "undue public concern", create "pro-energy climate" where "technically qualified persons" would agree that nuclear power poses "no significant threat" and could be entrusted "for the timely detection of potential abnormalities, or there is "no evidence" of such threat ( as though lack of evidence is proof of assertion) and the promises that turned into lies i.e. that nuclear power would be "too cheap to meter" providing society with "boundless energy" and save us from "freezing in the dark"., this is the language of Orwell's 1984, where peace is war and truth is a lie." ( Knelman, 1992).

### **Seductive devices, doctrines, dogmas, strategies and fallacies**

- **The "blatant misrepresentation or expedient omission" device**

This device involves the convenient exclusion of any part that could be detrimental to one's position.

The IAEA through expedient omission (possibly for advantageous "clarification") has left out a significant section in Agenda 21 which does not include nuclear energy in the list of "safe" technologies for the future. To "clarify" Agenda 21, the IAEA in its UNCED document stated the following:

“The UNCED Agenda 21 notes the need for a transition to environmentally sound energy systems, which will entail major changes in the patterns of energy production and consumption” (IAEA Document, p.5, 1992)

In the Atmosphere chapter of Agenda 21, the following [safe] and sound technologies are advocated:

“...cooperate to increase the availability of capacity, capabilities and relevant technologies ...for utilizing and producing environmentally [safe and} sound renewable energy resources, such as solar, wind, geothermal, hydropower and biomass,...

Each resource should be utilized in a manner that ... minimizes environmental stress and health impacts, ..." (Section 9. Subsection 9 g Agenda 21, 1992)

Thus, we see that in the Energy section of Agenda 21, Nuclear energy is not mentioned as being one of the [safe] or sound technology.

- **The "co-opted terms" strategy**

This strategy involves the stipulating of a new definition for a term that would jeopardize one's own argument.

In the Rio Declaration the following precautionary principle was advocated:

Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." ( Rio Declaration, 1992).

In the following statement, the IAEA redefines the important precautionary principle that was agreed to in the Rio Declaration, 1992.

"The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary" (IAEA Document , p. 2, authors emphasis)

The Rio principle, however, if enacted and truly adhered to, would bring about a moratorium on new nuclear power plants while phasing out currently existing ones.

- **The "comparison of convenience" device**

This device involves the narrowing down of alternatives so that whatever aspect is compared will appear favourable to the proposed alternative.

In the following statement from the IAEA document, the IAEA narrows the alternatives used for comparison to those which would appear to be favourable within the terms of reference of their comparison. Thus, for example, they compare the relatively low volume of nuclear wastes to the much larger volume of wastes from fossil fuels. However, it is the volume of wastes multiplied by their toxicity that is significant. Merely comparing volumes is a "comparison of convenience". The same false comparison is used to compare fuel requirements for the same energy output.

" A nuclear plant would require 27 tonnes of slightly enriched uranium each year, which corresponds to a few truckloads. The corresponding quantity of natural uranium is 160 tonnes.

a coal fired plant would need 2.6 million tonnes of coal each year... which corresponds to the load carried by 5 trains, each transporting 1400 tones every day  
an oil-fired plant would require 2 million tonnes of fuel oil per year, which is about 10 supertanker loads." (IAEA document, 1992, p.12)

The nuclear establishment never fails to compare coal and nuclear as competing energy sources, always claiming the inherent superiority of nuclear. Usually this is accomplished by failing to include the entire fuel cycle over its full life of impacts, social and environmental.

They conveniently exclude "safety" factors," "production of wastes," "Disposability of wastes," "degree of potential for bioaccumulation," lifetimes of wastes, toxicity and proliferation problems associated with nuclear.

Yet no bombs are built of coal, no terrorist is interested in hijacking coal or in the clandestine acquisition of coal weapons, coal plants do not have to be decommissioned and mothballed after some 30 to 50 years of operation, their hazardous wastes do not have to be guarded for 100,000 years, coal dust is easier to contain than radon and coal plants do not require liability subsidies by acts of parliament" ( Knelman, 1992)

• **The "lull and lure of the technological fix" syndrome ( the "misleading assurance" device or the fallacy of "technological omnipotence")**

This syndrome, device or fallacy involves the revealing of the seriousness of the problem and the offering of a "solution" which is usually worse than the problem

The proponents of a potentially dangerous act indicate that they recognize the danger and focus on one area for which they can offer a technological fix

In the following statement from the Radioactive Wastes section of Agenda 21, into which it appears that the IAEA had input, the following situation is recognized:

Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste ( as well as spent nuclear fuel destined for final disposal) is generated world-wide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. The high-level waste contains about 99 percent of the radionuclides and thus represents the largest radiological risk." ( Agenda 21, Radio Active wastes, 21.1.).

In the IAEA document the authors affirm the certainty of the technological fix.

“There is nevertheless a consensus among experts that safe geological disposal of high-level wastes, including spent nuclear fuel, is technically feasible.” ( IAEA Document, p.17)

“The view of experts in the field is that safe technological solutions exist for managing the waste.” (IAEA Document, 1992, p. 15)

Knelman (1992) points out that

“The assumption behind the notion of permanent disposal of High-level wastes deep in a stable geological formation is false because this assumption relies on the mistaken belief that anything we do technologically can be permanent. This assumption of permanence is particularly false when we are dealing with the lithosphere over some 100,000 years and when we must first disturb the geological structure by digging a very deep hole. AECL(Atomic Energy of Canada Limited) has dug a deep hole near Lac du Bonnet in Manitoba which is totally inappropriate for such so-called "permanent" disposal. For one thing you must, in all events, avoid water. Yet, The AECL hole must be soaked. Walt Patterson, a nuclear critic described this AECL research as follows: A drunk has lost his keys and is discovered by a police officer crawling around a street light. When questioned, the drunk admitted that he had lost his keys in front of a dark building, a block away. When asked why the drunk was then searching around the street light, the drunk said " you see, officer, the light is better here" and as Dr Martin Resnik off, an expert on geological waste disposal has put it " the earth does not stand still. In other words, experts in the relevant fields do not agree.” (Knelman, 1992, in progress)

• **The "rhetoric of notwithstanding clause" doctrine.**

This doctrine allows for the indulging in strong statements about deep concern and the need for significant change and then including a notwithstanding clause that negates the strong statement.

In the Rio declaration (1992) there is a strong statement about third world dumping:

“States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause severe environmental degradation or are found to be harmful to human health.” (Principle 14 Rio Declaration, 1992)

There are, however, disturbing "notwithstanding clauses" that appear such as in the following statements:

“Develop regulatory and non-regulatory measures and procedures aimed at preventing the export of chemicals that are banned, severely restricted, withdrawn or not approved for health or environmental reasons, *except when such export has received prior written consent from the importing country or is otherwise in accordance with the PIC procedure*; ( Section 19. subsection 53 f ”, Agenda 21, 1992)

In the following statement in the IAEA document, the IAEA energetically adopts the spirit of the " rhetoric of notwithstanding clauses"

“The IAEA in 1990 promulgated a Code of Practice on the International Trans-boundary Movement of Radioactive Waste as a basis for harmonization of national legislation and policies. The code lays down the conditions and principles for international waste transfers, such as that movement must be made in a manner consistent with the international safety standards, that there must be prior notification and consent of the sending, receiving and transit States, and that each State involved should have a regulatory authority...”( IAEA Document, 1992, p. 20

- **The "flamboyant absurdity" doctrine or dogma**

This doctrine or dogma carries the concerns of one's opponents to the point where the regulations governing the opponents' concerns should become the standard by which other potentially lesser concerns will be addressed.

The IAEA appears to advocate that, what is considered to be the most dangerous industry, just because it is dangerous, has developed stringent standards, and that they who contribute to possibly the greatest uncontrollable hazard are the ones who should assist the community in dealing with other hazards.

“The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary and are so well founded in science and so widely accepted that they are now also being regarded as a source of guidance in controlling pollutants and impacts arising from other human activities. Their wider application would undoubtedly contribute towards sustainable development. ” (p.2)

- **The "justification through dire consequences of alternatives" device**

This device involves the revealing of the dire consequences of the current practices and offering one own practice as the salvation for the problem

In the following statement the IAEA cites the dire consequences of the other alternatives to justify their proposed alternative:

“The problem of acid rain, which is linked to emissions from the burning of fossil fuels, has been recognized for decades..... the primary concern about the continued and increasing use of fossil fuels is the problem of CO<sub>2</sub> emission and the potential impact on world climate..... World conference on the Changing Atmosphere... need to reduce CO<sub>2</sub> emission (IAEA document, p. 5)  
climate change in connection with fossil fuels” (p. 9)

#### •The "benevolent outcome exploitation" strategy

This strategy involves the selection of the outcome which the opposition to the proposed alternative would advocate and the subsequent attempt to demonstrate that the proposed alternative, which the opposition would condemn, would be the best way of achieving that outcome.

In the following statements from the IAEA document, the IAEA focuses on the desired outcomes of reducing acid rain and limiting greenhouse gas to justify the selection of their proposed alternative:

“Several governments have already made commitments to reduce carbon emission, while recognizing that this will be hard to achieve except through drastic policy decisions in the energy sector.” (IAEA Document, 1992, p.6)

“Nuclear power plants in normal operations cause very little environmental detriment and are beneficial when they replace plants which would emit CO<sub>2</sub>, SO<sub>2</sub>, and NO<sub>2</sub> (p. 12). In this respect they would help to reduce acid rain and limit greenhouse gas emissions” (IAEA Document 1992 , p. 12)

To accomplish the above, IAEA and other nuclear proponents are recommending the construction of some 4000 to 5000 new commercial nuclear power plants. The combination of the multi-trillion cost and the time required for construction renders this proposal no less than bewildering. By the 6-to-10-year period required for construction, other sources of climate-altering gases would wipe out all gains. Secondly at 1/7th to 1/10th the above cost, a much greater reduction in CO<sub>2</sub> and other climate-altering gases can be achieved through simple available conservation and efficiency measures.

#### • The "flaunting and condoning of the vicious circle principle" strategy

This strategy is best explained by the economic principle that "bad money drives out good,". that is the opportunity costs of nuclear power are unacceptable and prohibitive Thus the money spent to subsidize nuclear

power is at the expense of the funds required to solve the energy problem with safe alternatives, and consequently, because the research into alternatives will not be effectively carried out, the safe alternatives will not be able to adequately replace the non-renewable forms of energy.

“In the 1992 report to UNCED, following was stated:  
Nuclear energy has safety risks associated with the entire uranium cycle, from mining through processing to the ultimate disposal of high-level radioactive wastes. In addition, there are safety risks associated with the reactors used to generate electricity from uranium. And the use of fossil fuel to drive conventional thermal generation produces carbon dioxide and waste heat.” (Canada's National report UNCED p. 46- 47)  
From a domestic consumption point of view, the least environmentally damaging energy option is energy efficiency. (Canada's National report UNCED p. 47)

Despite the above statement, the document concludes::

“New, cleaner technologies such as solar energy may help, but the hard fact is that to a large extent we will have to rely on either thermal, hydro, or nuclear energy in the future. In addition, energy projects for both export and domestic supply provide jobs and economic wealth to the country, and are especially important in some regions of Canada” ( p. 47. Canada's National report UNCED June, 1992, authors' emphasis)

The Canadian government has invoked the "vicious circle principle" by cutting subsidies to conservation efficiency and renewals. Canada is thus playing an important role in facilitating this not too hidden agenda by using many strategies, devices, doctrines, etc.

## **CONCLUSION:**

The " nukespeak" and the seductive devices, strategies, syndromes used by the Nuclear Industry involve the language of delusion and distortion. Hopefully, through the continued revealing and categorizing of these words of delusion we could, in some small way, counteract the impact of the not too-hidden-agenda of the IAEA, and the rest of the nuclear establishment and their government supporters.

#### Annex 4 ARRESTS IN B.C. FORESTS: WHO ARE THE REAL CRIMINALS

Since 1948, Canada has made significant international commitments to human rights, equity, social justice, ecological preservation, and ecologically sound practices, (Universal Declaration of Human Rights , 1948; International Covenant of Social, Cultural Rights; Environmental Conference in Stockholm, 1972; UN Conservation of Natural Heritage, 1972; the World Charter of Nature, 1982; Global Biodiversity Strategy, 1992; the Caracas Declaration 1992; Biodiversity Convention, Climate Change Convention and Agenda 21, 1992 ) The action to condemn and in some cases imprison individuals who call for Canada's compliance to these international, national and provincial commitments has been in direct violation of principles of equity, social justice and human rights.

For years, through its forest practices, Canada as well as the forest Industry has been in violation of international law., and even in violation of its own federal and provincial law. Through non-compliance with its international commitments, and with national and provincial Acts , the government has permitted devastation of its forests; this devastation is now recognized widely and condemned by the international community

The practice of clear-cutting, followed by [broadcast burn] artificial reforestation has undoubtedly many technical and organizational advantages. In the course of time, however, soil scientists and ecologists found out that the practice of clear-cutting automatically leads to considerable drawbacks:  
-wounding of the soil surface through logging operations. risk of erosion

-high irradiation and higher climatic extremes alter the microclimate, the flora and the microflora and deteriorate the growing conditions for a number of valuable tree species. Soil compression and a reduction of species richness occur  
-An accelerated decomposition of organic matter occurs, combined with a wash out of nutrients, and the eutrophication of ground water, rivers and lakes ( Dr Schutt, Biological Department, University of Munich, Environmental Ethics Conference, 1992, Vancouver)

Section 60 of the Forest Act calls for suspension of tree farm licensees if industry, through non-compliance to the Forest Act, has caused harm to the natural environment. Throughout B.C. environmentalists have been documenting evidence of non-compliance to the Forest Act. The Fisheries Department has documented evidence of violation by the forest industry of section 33 of the Fisheries Act. The Forest Act has not been enforced because most of the sections in the act are discretionary. One of the only recourses for environmentalists has been to call upon the Ombudsman to investigate whether government has fairly complied with its own legislation. In September of 1991, a complaint was filed with the Ombudsman's office to investigate whether governments have fairly complied with the Forest Act. This complaint has only now begun to be seriously investigated. The Ombudsman's office has not, however, been given the mandate to investigate whether or not the government of Canada is fairly complying with its international commitments.

The protesters, like the government and industry have not complied with the law. Governments and industry in Canada continue to violate international agreements, ignore the enforcement of federal and provincial Acts, and allow irreparable harm to the environment. Over 200 Vancouver Island protesters from environmental groups and from the Native community have been arrested, condemned as criminals and in some cases imprisoned because they call for compliance to commitments, attempt to prevent irreparable harm, and demand that environmental law be enforced in a less discretionary manner.

In the latest case, the protesters in Clayoquot Sound have been condemned as criminals because of their non-compliance with an injunction to prevent them from preventing irreparable harm. On the other hand, McMillan Bloedel has been fined in Clayoquot Sound for causing irreparable harm. Traditionally, the equitable remedy of injunctions is deemed necessary to prevent irreparable harm. In 1985, the court concurred with this conception in McMillan Bloedel vs. Mullin where it was decided that

“Indians, ...will be deprived of valuable ecological rights, and in further light of the fact that irreparable harm will not result to the Logging Company if timber harvest is delayed pending an expedited adjudication of issue” [1985, BCD Civ 1892-08]

Now, the courts have appeared to misconstrue the concept of irreparable harm: those who cause irreparable harm ( industry) through non-compliance with international, national and provincial commitments are granted

injunctions to facilitate their continuing to cause irreparable harm , while those, ( environmentalist and native leaders) are condemned as criminals for not complying with the injunctions granted to facilitate irreparable harm. The most that has happened to industry when it has been found in fault is a fine not criminal condemnation; thus, the causing of irreparable damage is deemed to be compensable through fines, whereas attempting to prevent irreparable damage by ignoring an injunction is deemed to be rectified through criminal proceedings.

If governments do not comply with their commitments, if the courts misconstrue equitable law, and if the ombudsman has a limited scope of jurisdiction, where can the public turn for justice?

Copies of this letter was sent on Tuesday December 23, 1992, to the Vancouver Sun, the Globe and Mail, Web international network, and to UNEP ( United Nations Environmental Programme)

Since 1972, Canada has made significant international commitments to human rights, equity, social justice. ecological preservation, and ecologically sound practices, (Universal Declaration of Human Rights , 1948; International Covenant of Social, Cultural Rights; Environmental Conference in Stockholm, 1972; UN Conservation of Natural Heritage, 1972; the World Charter of Nature, 1982; Global Biodiversity Strategy, 1992; the Caracas Declaration 1992; Biodiversity Convention, Climate Change Convention and Agenda 21, 1992). The action to condemn and in some cases imprison individuals who call for Canada's compliance to these international, national and provincial commitments has been in direct violation of principles of equity, social justice and human rights.

For years, through its forest practices, Canada as well as the forest Industry has been in, and even in violation of its own federal and provincial law. Through non-compliance with its international commitments, and with national and provincial Acts , the government has permitted devastation of its forests; this devastation is now recognized widely and condemned by the international community

“The practice of clear-cutting, followed by [broadcast burn] artificial reforestation has undoubtedly many technical and organizational advantages. In the course of time, however, soil scientists and ecologists found out that the practice of clear-cutting automatically leads to considerable drawbacks:  
-wounding of the soil surface through logging operations. risk of erosion

-high irradiation and higher climatic extremes alter the microclimate, the flora and the microflora and deteriorate the growing conditions for a number of valuable tree species. Soil compression and a reduction of species richness occur  
-An accelerated decomposition of organic matter occurs, combined with a wash out of nutrients, and the eutrophication of ground water, rivers and lakes” ( Dr Schutt, Biological Department, University of Munich, Environmental Ethics Conference, 1992, Vancouver)

Section 60 of the Forest Act calls for suspension of tree farm licensees the licence holder has caused harm to the natural environment. Throughout B.C. environmentalists have been documenting evidence of non-compliance to the Forest Act. The Fisheries Department has documented evidence of violation by the forest industry of section 33 of the Fisheries Act. The Forest Act has not been enforced because most of the sections in the act are discretionary.

The protesters, like the government and industry have not complied with the law. Governments and industry in Canada continue to violate international agreements, ignore the enforcement of federal and provincial Acts, and allow irreparable harm to befall the environment. Over 200 Vancouver Island protesters from environmental groups and from the Native community have been arrested, condemned as criminals and in some cases imprisoned because they call for compliance to commitments, attempt to prevent irreparable harm, and demand that environmental law be enforced in a less discretionary manner.

In the latest case, the protesters in Clayoquot Sound have been condemned as criminals because of their non-compliance with an injunction to prevent them from preventing irreparable harm. On the other hand, McMillan Bloedel has been fined in Clayoquot Sound for causing irreparable harm. Traditionally, the equitable remedy of injunctions is deemed necessary to prevent irreparable harm. In 1985, the court concurred with this conception in McMillan Bloedel vs. Mullin where it was decided that

“Indians, ...will be deprived of valuable ecological rights, and in further light of the fact that irreparable harm will not result to the Logging Company if timber harvest is delayed pending an expedited adjudication of issue” [1985, BCD Civ 1892-08]

Now, the courts have appeared to misconstrue the concept of irreparable harm: those who cause irreparable harm ( industry) through non-compliance with international, national and provincial commitments are granted injunctions to facilitate their continuing to cause irreparable harm, while those ( environmentalist and native leaders) are condemned as criminals for not complying with the injunctions granted to facilitate irreparable harm. The most that has happened to industry when it has been found in fault is a fine not criminal condemnation; thus, the causing of irreparable damage is deemed to be compensable through fines, whereas attempting to prevent irreparable damage by ignoring an injunction is deemed to be rectified through criminal proceedings.

If governments do not comply with their commitments, and if the courts misconstrue equitable law, where can the public turn for justice?

Often intact ecosystems that have been deserving of preservation have been irreversibly destroyed because it was deemed necessary, if these ecosystems were to be withdrawn from an existing tree farm licence, for governments to pay compensation. In the past, compensation has been assessed purely from an economic basis without taking into consideration the true environmental costs. In order to assess the environmental costs of the destruction of significant ecosystems one may need to examine if damage to the natural environment within a significant ecosystem has occurred. Section 60 of the Forest Act does permit the suspension of licenses if environmental damage to the natural environment has occurred. The potential environmental costs of destroying significant ecosystems as a result of the Ministry of Forests not suspending tree farm licenses when there was evidence of destruction to the natural environment is necessary to include in the assessment of compensation. Although, often the companies that have contributed in the past to the destruction of significant ecosystems may not be the current holders of the specific tree farm licence in the area containing the significant ecosystem, most of the companies are still functioning in British Columbia. This investigation of the environmental costs would involve the whole province so that there would need to be a global assessment of environmental costs incurred by the companies, not a valley-to-valley assessment.

Canada violates or ignores international environmental documents to which it has been a signatory while deluding the world community into thinking that it is genuinely concerned about the environment.

At the press conference given by Federal Minister of the Environment, Jean Charest at the UNCED conference in Rio, a representative of the United Nations introduced Charest as being from a country which was truly concerned about the environment. During the question period I indicated that " UNCED should be a time to dispel myths not perpetuate them and that Canada is not an ecologically sound country and that we should be honest with the rest of the world

Evidence that could dispel the myth that Canada is truly concerned about the environment has been occurring for years throughout B.C. in the forest industry, and is occurring currently in the dispute in Clayoquot Sound.

Rather than the courts in Canada insisting on adherence to international environmental documents such as the World Charter of Nature ( UN Resolution 37/7, 1982) or to the current Convention on Biological Diversity ( 1992), Canadian courts condemn those who strive to call for the adherence to international law (environmentalists) , and condone those who ignore International Law. (industry).

For Example, Canada is a signatory of the World Charter of Nature, 1982 (UN resolution 37/7) which states the following:

11. Activities which might have an impact on nature shall be controlled, and the best available technologies that minimize significant risks to nature or other adverse effects shall be used; in particular;

a) all activities which are likely to cause irreversible damage to nature shall be avoided;

c) Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed;

Have governments in Canada since 1982 "avoided" industrial activities such as ecologically unsound "logging practices that have caused irreversible damage to nature.? Have governments in Canada called upon forest companies to not proceed with ecologically unsound practices whose adverse effects are not fully understood?

In 1992, Canada is now a signatory of the Convention on Biological Diversity which notes the following:

that it is vital to anticipate, prevent and attack the causes of significant reduction or loss of biological diversity at source.

Also, where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat

Is Canada reducing the loss of biological diversity at the source, when it is prepared to log old growth forests before it has carried out adequate non--length research into the true biodiversity of the old growth forests? Is there not strong enough evidence in place that clear-cut logging has destroyed biodiversity, yet we appear to wait for "scientific certainty" before we are prepared to avoid or minimize such a threat? By that time there may be very little biodiversity left.

At the Press Conference where Mulroney signed the Convention on Biological Diversity in Rio de Janeiro, I asked him " if the signing of this document would mean that the government of Canada would condemn ecologically unsound practices such as clear-cut logging that destroy biodiversity". He replied that "he did not want to deal with issues "

If Mulroney is willing to sign a document professing to adhere to the preservation of biodiversity, and if he is not willing to deal with the practices that contribute to the loss of biodiversity, then the Canadian public will have to bring this discrepancy between rhetoric and action to the attention of the international community.

The environmentalists who have continually been striving to preserve the little remaining old growth forests, and to call for the need to identify and do research into biodiversity are the ones who have been adhering to the principles enunciated in the United Nations' World Charter of Nature. They will also be the ones who are calling for the preservation of the old growth areas so that Canada will be able to adhere to the binding principles enunciated in the United Nations Convention on Biological Diversity. Yet it is those who act to prevent "irreversibility" that are prosecuted as criminals, and those who cause "irreversibility" that are protected by Canadian courts

LEGISLATURE WAS STORMED BY THE PROTESTORS WROTE TO PRESIDENT OF WORLD HERITAGE COMMITTEE  
1993 RESOLUTION ABOUT WORLD HERITAGE RESOLUTION RELATED TO PROTECTION OF A NETWORK OF OLD GROWTH FORESTS AND PATHWAYS GOING TO PRESENT IT TO PREMIER HARCOURT.

( )1993 Revised THE OLD GROWTH PROCLAMATION for the Walbran and rewrote it for Clayoquot and added references to UNCED  
It WAS READ BY THE PROTESTORS WHEN THEY WERE BEING ARRESTED

**( ) THAT on June 30 1993**

**I received an invitation to contribute to the Peace and Global Educators**

**Hi Joan:**

**Next year I am editing the Peace and Global Educators Journal--PAGE. We are looking for contributors and I naturally thought of you and all of your work. See what you think. See attached and feel free to call me for more clarification.**

**Sincerely,**

**SUMMER OF 1993**

See attached programme

Went up to her house - wrote a piece

She did not publish mine but wrote something similar

( )THAT in1993 I wrote RESOLUTION ABOUT WORLD HERITAGE RESOLUTION RELATED TO PROTECTION OF A NETWORK OF OLD GROWTH FORESTS AND PATHWAYS GOING TO PRESENT IT TO PREMIER HARCOURT.

( )THAT in 1993, I printed up copies of the World Charter of Nature WHICH WAS READ BY THE PROTESTORS WHEN THEY WERE ARRESTED

EXHIBIT

OLD GROWTH PROCLAMATION

( ) THAT LEGISLATURE WAS STORMED BY THE PROTESTOR

COMMENT

The environmental groups that organized the rally failed to take a strong stand against the logging of Clayoquot Sound. the crowd was frustrated at the weakness of their statements and stormed the legislature

( ) THAT in 1992, I co-authored a paper with Rod Dobell, R. and J. Russow. (1992)

EXHIBIT:

“NAFTA: Policy Considerations: moving towards continent-wide standards drawing from the highest tenable principles related to human rights, ecology and equity;.” Presentation to NAMI. (North American Institute)

**April 1992**

• Worked on a paper on • by assisting a professor prepare papers for the following conferences: NAFTA (a paper indicating the need to have high common environmental standards in the three countries before entering into an agreement); NAMI North American Institute ( a paper examining the questionable involvement of industry in education); and ( a proposal and design for an environmental course for graduate students in Business Administration) 1992 and international agreements.

Found

World Charter of Nature and realized that the problem was not existing document but the implementation and compliance with the documents.

. 1993 carried out research in Ottawa related to NAFTA, received information about Environmental assessment review of NAFTA from November 1992.

I noted serious discrepancies between what the Canadian government said was in NAFTA and what was actually in NAFTA

**I made a diagram showing the discrepancy between the NAFTA agreement and what was actually in the NAFTA agreement**

**I believe that this was the time that I met Arthur Campeau on train and he told me about the endorsement at the cabinet level of the two UNCED Conventions**

**COMMENT:**

**I met with representatives from Mexico and US and discussed the need for a resolution to come out of our session. We announced the proposal to have a resolution and invited people at the meeting of about 30 to attend a session. We drafted a resolution**

**RESOLUTION. and presented it to the plenary which endorsed it.**

## **EXHIBIT**

**GIVEN THAT TWO OF THE HEADS OF STATES THAT  
NEGOTIATED THE NAFTA ARE NO LONGER IN POWER  
AND GIVEN THAT THE NAFTA HAD NOT BEEN AVAILABLE FOR FULL PUBLIC  
SCRUTINY PRIOR TO ADOPTION  
GIVEN THAT THERE ARE ARTICLES IN THE NAFTA WHICH HAVE BEEN  
MISREPRESENTED BY CANADA TO ITS CITIZENS**

**BE IT RESOLVED THAT THE CURRENT NAFTA BE ABOGATED AND IF  
THERE IS ANOTHER AGREEMENT IT MUST TAKE INTO CONSIDERATION THE  
FOLLOWING:**

**In all three countries, citizens are concerned about THE Following:**

- (i) Disillusion of a public process**
- (ii) Exploitation of the labour force**
- (iv) Inequitable distribution of resources**
- (v) Disenfranchising of the many**
- (vi) Violation of human rights**
- vii) Denigration of social justice**
- (viii) Unquestionable imperative to grow)**
- (ix) Over-consumptive pattern of behavior**
- (x) Undermining of national and state and provincial laws through  
international tribunals**
- (xi) Relaxing of environmental standards with test once**
- (xii) Irreversible loss of ecological heritage**
- xiii) Destruction of ejidoes**
- (xvi) Misplaced spending priorities**

**IF THERE IS A NEW AGREEMENT IT SHOULD NOT BE FULLY  
NEGOCIATED UNTIL THERE IS AN ELECTION IN MEXICO AND UNTIL THE  
CLOSURES OF THE AGREEMENT ARE MADE AVAILABLE FOR PUBLIC  
SCRUTINY FOR PUBLIC IT HAS THE FULL SUPPORT OF CONCERNED  
CITIZENS IN ALL THREE COUNTRIES**

**( ) THAT 1993 at the Environmental Conference in Eugene, I Went to the  
session given by Richard Grossman**

**( ) THAT in 1993, March I attended a session organized by Richard  
Grossman on Taking Care of Business- calling for the revoking of Charters of  
Corporations that violated human rights, destroyed the environment,  
contributed to war and conflict, and denied social justices.  
Also at the final plenary I proposed that we recommend that the next meeting  
of the conference be on the Revoking of Charters of transnationals. This  
recommendation was greeted with great enthusiasm [I noticed however that  
this was not to be the case]**

instruments and where there were still gaps that required protection. This Diagram was passed on to a Canadian government delegate who undertook to take the diagram to Vienna for the Conference.

**( ) THAT in 1993, I examined the evolution of the precautionary principle through various international instruments: A contract with the BCEN**

## **EXHIBIT**

**1993- 1997 DISTRIBUTED**

**2. THE EVOLUTION OF THE PRECAUTIONARY PRINCIPLE FROM ITS INITIAL ENUNCIATION IN 1972, THROUGH ITS REINFORCEMENT IN 1982 TO ITS REALIGNMENT IN 1992.**

***"It also seems clear that the road from declaring global principles to effective world-wide action will be a very long and hard one." (15, Man's environment and the Atlantic Alliance" 1972)***

.

Since 1972, the essence of the precautionary principle was agreed to by the global community

Determination to shape actions with prudent care for the environment principle

A point has been reached in history when we must shape our actions throughout the world with a more prudent care for their environmental consequences. Through ignorance or indifference, we can do massive and irreversible harm to the earthly environment...Declaration of the United Nations Conference on the Human Environment (Declaration of the United Nations Conference on the Human Environment (1972)

This principle was further reinforced in 1982, in the World Charter of Nature:

Avoidance of activities if adverse effects not fully understood principle

Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature, and where potential adverse effects are not fully understood, the activities should not proceed (11 b) World Charter of Nature (1982)

Avoidance of irreversible damage to nature principle

Activities which are likely to cause irreversible damage to nature shall be avoided (11. a) World Charter of Nature (1982)

In 1992, in the UNCED documents there is the full enunciation of the precautionary principle. This principle is present in all the documents in differing forms:

In the Rio Declaration it is expressed in the following way:

“Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation.” (Rio Declaration, 1992). : and in the Framework for a Climate Change Convention, it is phrased in a different way:

3. The Parties should take precautionary measures to anticipate, prevent or minimize the causes of climate change and mitigate its adverse effects. Where there are threats of serious or irreversible damage, lack of full scientific certainty should not be used as a reason for postponing such measures, taking into account that policies and measures to deal with climate change should be cost-effective so as to ensure global benefits at the lowest possible cost. To achieve this, such policies and measures should take into account different socio-economic contexts, be comprehensive, cover all relevant sources, sinks and reservoirs of greenhouse gases and adaptation, and comprise all economic sectors. Efforts to address climate change may be carried out co-operatively by interested Parties.” (Climate Change Convention, 1992)

A comparison of these two enunciations of the precautionary principle indicate that the principle has been considerably weakened in the Climate Change Convention where it has moved from "shall" to "should", and where there is no mention made of the need to prevent environmental degradation. The Rio Declaration, though adopted by the global community by consensus, is not legally binding, whereas the Convention, is legally binding. However, in using the term "should" in a legally binding document the framers have perhaps given it no more status that it had in a non-legally binding document with "shall"

### **3. ESSENTIAL PROPERTIES OF THE PRECAUTIONARY PRINCIPLE DRAWN FROM INTERNATIONAL DOCUMENTS AND NATIONAL DOCUMENTS.**

*What kind of policy action will be needed in the '80s to address these issues: given the current economic climate, how can nations collectively marshal the political will required to develop and implement the needed policies? what is the role of international co-operation in this and in particular, what is the role of OECD. MacNeill, Director, OECD, Environment Directorate*

In this section, to begin to assess policy maker's response in Canada to the precautionary principle, we will examine different properties that have been identified as being essential to addressing the problem in Canada. We have selected as the principal document for this examination, the 1991, Canadian document from the Standing Committee of Global Warming because this is a document that arose from a set of hearings carried out by a committee of parliamentarians from all three political parties. Additional properties are also drawn from other documents from policy makers or advisory or consultative bodies.

The precautionary principle has a number of underlying implicit properties that would have to be considered in determining adherence to the

precautionary principle: these properties are evident in a number of documents emanating from policy makers.

(3.1.). The invoking of the precautionary principle to address one environmental problem should not cause another problem or that the solution to the environmental problem should not itself be an activity or a substance that could potentially cause irreversible harm.

1991 There is little merit in solving one problem by creating others. The Committee has therefore endeavoured to be responsible in making recommendations that clearly have wider implications beyond the problem of global warming.”

(Standing Committee on the Environment, p. 18)

(3.2.). The invoking of the precautionary principle might require substantial change

At the same time, however we need to insist that the character and importance of global warming will demand significant changes in the present situation. If we do not alter our "life as usual" to reduce the threat of global warming, changes of climate and rises in sea-level will force unpleasant consequences on us. ”(Standing Committee on the Environment, p. 18)

(3.3.) The invoking of the precautionary principle might require the acknowledgement that the inaction could involve risks

Title of Standing Committee report "Out of balance: the risks of irreversible climate change ”(Standing Committee on the Environment, 1991)

(3.4)The invoking of the precautionary principle could require supportable evidence not necessarily in the certainty of environmental harm but at least in the likelihood

" Global warming is real and serious

1.1. Our report is based on three main premises:

- global warming has been proved scientifically;
- It is an inevitable and continuing consequence of past and present patterns of human activity; and
- it represents a severe threat to both Canada and the planet as a whole

(1991, Standing Committee on the Environment)

(3.5.). The invoking of the precautionary principle will require a demonstration of the credibility of those who frame the problem

1.7 As regards the reality of global warming, the international scientific community has during the last two to three years, undertaken and urgent and comprehensive review of the evidence. This inquiry by the IPCC under the auspices of the WMO and UNEP reported its findings at the Second World

Climate Conference in 1990. The panel reported that we are certain of the following:

“The greenhouse effect is real

Man-made emissions are substantially increasing the atmospheric concentrations of the greenhouse gases: carbon dioxide, methane, the CFCs, nitrous oxide and tropospheric ozone. These increases will lead to a warming of the Earth's surface...

We calculate with confidence that:

Atmospheric concentrations of the long-lived gases (Carbon dioxide, nitrous oxide and the CFCs) adjust only slowly to changes in emissions. Present day emissions of these gases are committing us to increased concentrations for decades to centuries...

the long-lived gases would require reductions in man-made emissions of 60-80% to stabilize their concentrations at today's levels; methane would require only a 15%-20% reduction.” (Intergovernmental panel on Global change p. 29 as cited in the standing committee Report, p. 5)

(3.6.). The invoking of the precautionary principle will require an understanding of the position of experts who do not agree with the assessment of the problem, and the supplying of good arguments to justify the position to implement the precautionary principle

1.5 There is no mystery to what is happening, yet there are still some who are unconvinced. A very few of these are scientists who offer alternative explanations for the measurements and other data that have convinced the vast majority of their colleagues. A larger group of people lack the scientific background required to evaluate the evidence and appears reluctant to accept as reality what cannot yet be seen or touched. A third groups, apparently including many Canadians, regards the prospect of global warming as something desirable, and therefore no cause for concern.

1.6. the Committee's first task, therefore is to explain briefly why we are convinced to the basic premises set out in para 1.1. In doing so, we need to respond both to those who doubt global warming and to those who accept that it is taking place, but believe that it should be welcomed by Canadians.

1.10. In any case, it is clear from the evidence it provided to us, and from its report, that the Marshall Institute is mainly urging expanded research on global warming in a 3-5-year period and the avoidance of drastic policy changes before that research is undertaken.

Dr. Seitz,

" ... I want to make it clear that I do not place those who express a word of warning in the same category as the boy who cried wolf too often, since there may indeed be a wolf somewhere in the forest. There is too much to be gained by continuing on with our form of civilization to deviate radically without more solid evidence that the biosphere is in mortal danger in the immediate future from uncontrolled warming. I fully realize that this attitude involves a calculated risk, but I also feel that we must balance that risk against the certain damage that will be done if we shut down our power stations and our factories, halt the great advances in communication and transportation

achieved in the last century or so. These comments do not imply that we should not use fossil fuel in the most efficient and conservative manner or that we should not consider the use of alternative, non-polluting sources such as nuclear energy when appropriate. Indeed, economic factors alone may dictate such shifts. "Scientific Perspectives on the Greenhouse Problem, George C. Marshall Institute, Washington, D.C., 1989

1.11. We recommend that action should be taken now, not 3 to 5 years from now, to reduce substantially the rate of greenhouse gas emissions throughout the world and specifically in Canada.

1.16 ..Canada should be as active as other nations in taking action to reduce or delay such warming. ... p. 8

(3.7.). The invoking of the precautionary principle will require commitment to the principle that even though Canada may not benefit, for the sake of the global community, we must act.

1.16.4. Even if global warming could be shown to benefit Canada, which is far from being the case, there is growing evidence of its potentially severe and even disastrous implications in other parts of the world, and especially in developing countries. Canada cannot adopt a laissez-faire attitude to what is happening. Many millions of people live on the margin of survival not merely in terms of nutrition and similar measures; small changes of climate or of sea-level would make their physical environment uninhabitable.

Man-made emissions are substantially increasing the atmospheric concentrations of greenhouse gas emissions.

"Environmental policy should be integrated fully into other policies. It should be considered as a fundamental factor when economic decisions are taken. In this context we stress the importance of sustainable development; prevention rather than cure; environmental impact assessment; setting environmental standards on the basis of best technology; and development of less polluting and more cost-effective technologies, including those for controlling emissions at source. (5) "the Way forward Environment ministers London, 1984

"Environmental policy should be integrated fully into other policies. It should be considered as a fundamental factor when economic decisions are taken. In this context we stress the importance of sustainable development; prevention rather than cure; environmental impact assessment; setting environmental standards on the basis of best technology; and development of less polluting and more cost-effective technologies, including those for controlling emissions at source. (5) "the Way forward Environment ministers London, 1984

(3.8.). The invoking of the precautionary principle will require the commitment that the solution lies in prevention not cure or repair

"It is essential, in both developing and developed countries, to manage sustainable resources wisely, and to this end we emphasize that prevention of damage is better than repair.

This principle is fully effective only in the framework of intensive international co-operation because many of these problems range far more widely than any one of our countries. (2) "the Way forward Environment ministers London, 1984

"the 'polluter pays Principle' is of key importance to ensuring that environmentally correct prices and market signals are given and should be developed and applied more widely (5) "the Way forward Environment ministers London, 1984

" We must also be more forward-looking in addressing emerging environmental issues such as possible climatic changes resulting from human activities, the need to examine alternative energy strategies, and the environmental impact of new forms of industry including biotechnology." (5) ("the Way forward Environment ministers London, 1984)

#### IV Environmental Policies

12. New approaches and strengthened international co-operation are essential to anticipate and prevent damage to the environment, which knows no national frontiers....We shall also address other concerns such as climatic change, the protection of the ozone layer...1985 Bonn economic Declaration May 4, 1985

4. Economic progress and the preservation of the natural environment are necessary and mutually supportive goals. Effective environmental protection is a central element in our national and international policies. 1985 Bonn economic Declaration May 4, 1985

13. We shall harness both the mechanisms of governmental vigilance and the disciplines of the market to solve environmental problems. We shall develop and apply the polluter pays principles more widely. Science and technology must contribute to reconciling environmental protection and economic growth. 1985 Bonn economic Declaration May 4, 1985

(3.9.). The invoking of the precautionary principle will require the commitment that the solution calls for new initiatives and the maintaining of options (non-reduction of options)

#### 1980 The Global 2000

" If these trends are to be altered and the problems diminished, vigorous, determined new initiatives will be required worldwide to meet human needs while protecting and restoring the earth's capacity to support life. Basic natural resources — farmlands, fisheries, forests, minerals, energy, air and water — must be conserved and better managed. Changes in public policy are needed around the world before problems worsen and options for effective action are reduced. iv

" If decisions are delayed until the problems become worse, options for effective action will be severely reduced (5)

(3.10.). The invoking of the precautionary principle will require global actions. Nonetheless, given the urgency, scope, and complexity of the challenges before us, the efforts now underway around the world fall far short of what is needed. An era of unprecedented global co-operation and commitment is essential. iv)

We can avoid polluting our own environment, and we must take care that we do not degrade the global environment. iv) Finally to meet the challenges described in the Global 2000 Study our federal government requires a much stronger capability to project and analyze long-term trends. 1980 The Global 2000

"In a remarkable report to the Economic and Social Council of the UN (in May 1969) U Thant, then Secretary General of the UN, portrayed the extraordinary world-wide dangers to man's environment, by saying:

"It has become clear that we all live in one biosphere with which space and resources, though vast are limited.

He then proposed, and the General Assembly agreed to hold an International Conference on Human Environment, in Stockholm in June 1972. Man's environment and the Atlantic Alliance" 1972

(3.11.). The solving of the environmental problem will require acknowledgement of the inertia and time lag that affects effective action 1981

OECD publications

"Our governments today face inflation, unemployment, a leveling-off in the growth of productivity and rising energy prices. At the same time, they have to respond to popular aspirations including continued pressure for an improved environment.

Governments are also faced with a lack of consensus among scientists about the nature, extent and damage of some of the phenomena. Judging from a recent OECD - IEA workshop this is true, for example, of the rate and impact of rising levels of CO<sub>2</sub> on climatic change. In the absence of scientific consensus, political consensus, especially international consensus, is hard to achieve. However, if governments wait for scientific near-certainty, it will often be too late for them to act at all either because of the inertia of the natural phenomena, or because of the time lags associated with policy development and international negotiation. "(Van Lennep, Secretary-General of the OECD "The Environment Challenges for the 80s)

(3.12.). The solving of the environmental problem requires the summoning up of the international political will

" I am sure it is clear to everyone that it will not be easy for our nations collectively to Marshall the political will necessary to deal with these issues. In the absence of scientific consensus, political consensus, especially international consensus, is hard to achieve.

However, if governments wait for scientific near-certainty, it will often be too late for them to act at all either because of the inertia of the natural phenomena, or because of the time lags associated with policy development

and international negotiation. "(Van Lennep, Secretary-General of the OECD "The Environment Challenges for the 80s)

#### **4. OVERVIEW; COMPARISON OF THE 1988 CONFERENCE STATEMENTS, 1988 SCIENCE COUNCIL OF CANADA. THE STANDING COMMITTEE ON THE ENVIRONMENT AND THE 1992 CLIMATE CHANGE CONVENTION IN RELATION TO THE APPROACH TO THE PRECAUTIONARY PRINCIPLE**

To attempt to extend the understanding of the social learning that has occurred in Canada in the crucial years leading up to the framing of the *Framework Convention on Climate Change*, we will examine the transition that occurred between the official and the NGO recommendations contained in the proceedings from the international conference, *The Changing Atmosphere*, held in Canada in 1988, and the action plan in the Atmosphere section of Agenda 21/ the binding commitments contained in the Climate Change Convention.

[the Montreal Protocol, and the Canadian proposals to the climate change discussion at the New York Prep Com, and follow-up meeting should also be included]

the following documents and sections from documents will be examined

Recommendation from the Changing Atmosphere, 1988;

Recommendations from the Changing Atmosphere submitted by the NGOs 1988

Atmosphere section in Agenda 21 1992

Climate Change Convention 1992

##### **4.0. Overview**

*Humanity is conducting an unintended, uncontrolled, globally pervasive experiment whose ultimate consequences could be second only to a global nuclear war. (Conference statement, 1988)*

Although we are examining the precautionary principle and the impact of the precautionary principle on the commitment to action to address the global warming issue, it should be acknowledged that the precautionary principle is inextricably linked to the "Environmental assessment" principle, "the full life cycle analysis" principle, the "non-transferring of harmful activities or substances" principle, "polluter pay principle", all enunciated in the documents emanating from UNCED.

Before tracing the precautionary principle as it manifests itself in the documents, and before placing the different sections into the "social learning project" functions (SEE APPENDIX), we will first reflect on a property, of the precautionary principle, which was enunciated in the UN mandate to set up the World Commission on Environment and Development (Brundtland Commission). In the mandate the global community was to "elaborate strategies and measure to halt and reverse the effects of environmental degradation ..." (reported in Agenda 21, section 38.1)

One of the questions that has to be addressed in relation to the precautionary principle, is "is the global community 'halting and reversing the effects of environmental degradation' by stating generally that it will address

the problem, without making a commitment for targets and time-lines? Would this mandate to halt and reverse form the basis for the precautionary principle? Could the global community be committed to adhering to the precautionary principle if the documents contain an enunciation of the precautionary principle but there is no commitment to halt or reverse the effects of environmental degradation? Is the only way of carrying out the precautionary principle to enunciate and act upon targets and time-lines?

Up until the end of the February session of the negotiations for the Framework Convention, targets for CO<sub>2</sub> were included in the Proposed Framework Convention on Climate Change:

section 4.2.1. started with the following: The developed country Parties shall adopt national policies and take corresponding measures on the limitation of anthropogenic emissions of greenhouse gases and the protection and enhancement of greenhouse sinks and reservoirs. These developed country policies and measures will have the effects of as a first step, stabilizing individually or jointly emissions of Carbon dioxide in general by the year 2000 at the 1990 level...

After February, the same section of the Framework Convention read, or at least the final version read as

(a) Each of these Parties shall adopt national policies and take corresponding measures on the mitigation of climate change, by limiting its anthropogenic emissions of greenhouse gases and protecting and enhancing its greenhouse gas sinks and reservoirs. These policies and measures will demonstrate that developed countries are taking the lead in modifying longer-term trends in anthropogenic emissions consistent with the objective of the Convention, recognizing that the return by the end of the present decade to earlier levels of anthropogenic emissions of carbon dioxide and other greenhouse gases not controlled by the Montreal Protocol would contribute to such modification, and taking into account the differences in these Parties' starting points and approaches, economic structures and resource bases, the need to maintain strong and sustainable economic growth, available technologies and other individual circumstances, as well as the need for equitable and appropriate contributions by each of these Parties to the global effort regarding that objective. These Parties may implement such policies and measures jointly with other Parties and may assist other Parties in contributing to the achievement of the objective of the Convention and, in particular, that of this sub-paragraph;

(b) In order to promote progress to this end, each of these Parties shall communicate, within six months of the entry into force of the Convention for it and periodically thereafter, and in accordance with Article 12, detailed information on its policies and measures referred to in sub-paragraph (a) above, as well as on its resulting projected anthropogenic emissions by sources and removals by sinks of greenhouse gases not controlled by the Montreal Protocol for the period referred to in sub-paragraph (a), with the aim of returning individually or jointly to their 1990 levels these anthropogenic emissions of carbon dioxide and other greenhouse gases not controlled by

the Montreal Protocol. This information will be reviewed by the Conference of the Parties, at its first session and periodically thereafter, in accordance with Article 7;

Generally, the reasons for moving from the strong targets was the United States insistence on a Convention with no specific time lines or targets. The United States position was characterized by one member of NGO community in the following way:

The United States — with 25% of global carbon dioxide emissions, remained the main culprit in watering down the text. ... the United States — urged by the coal lobby — ensured that the convention lacked any legally binding commitment to stabilize or reduce emissions of carbon dioxide and other greenhouse gases." (Dubash, N, and Hajost, S., Network, June, 1992, p. 11)

The climate change convention conveys an ambivalent message about the need to implement the precautionary principle, whereas the 1988 Conference and the 1991 parliamentary committee appear to convey a consistent message about the need to implement the precautionary principle. The atmosphere chapter of Agenda 21 appears to be in an intermediary position between ambivalence and consistency. These documents appear to reflect the different frames described in the introduction.

In the conference statement from 1988, and in the NGO statement of 1988, and in the Standing committee of 1991 the recommendations form a consistent whole which appears to reflect the deep concern by the participants for the serious environmental impacts from global warming and ozone depletion. In the Science Council document and in the Framework Convention, however there appears to be an uncomfortable [uneasy] alliance between environmental concern— "Concerned that human activities have been substantially increasing the atmospheric concentrations of greenhouse gases" and economic growth — "the Parties should co-operate to promote a supportive and open international economic system that would lead to sustainable economic growth." This ambivalence is also reflected in the potentially irreconcilable incompatibility between advocating adherence to the precautionary principle and the admonition to consider the impact on economic development that would be required to cease if the precautionary principle were to be adhered to.

Unfortunately, in all legal environmental documents, conventions and charters in contrast to recommendations coming from a gathering of concerned representatives, there appears to always be strong statements that appear to reflect genuine concern for addressing the urgency of the problem that are weakened by the "notwithstanding" clauses that are always present to be ferret out for appropriate self-interest. A comparison between the clear statements made at the international conference in Toronto in 1988, the "Changing Atmosphere" and the ambivalent statements from the Climate Change Convention reflect the contrast between a unifying statement of concern and a potentially irreconcilable conflict between interest and concern.

One underlying theme that pervades these documents, is that in one case there is willingness to accept the certainty or if not the certainty then a willingness to actually use the precautionary principle — not having to wait for

scientific certainty to act —, and in the other, there is a willingness to state the "uncertainty", and then state the precautionary principle without acting upon the precautionary principle. In the preamble of the Convention is a statement noting that there are many uncertainties in predictions of climate change, particularly with regard to the timing, magnitude and regional patterns thereof, " Subsequently in the text is the enunciation of the precautionary principle. If the precautionary principle were adhered to in the document itself, stronger actions to address the "threats of serious irreversible damage" would not have to wait for "scientific certainty." In the climate change issue, because of the scientific uncertainty of many of the outcomes of anthropogenic activity on climate, the precautionary principle which was enunciated in most of the documents from UNCED is particularly significant. Unfortunately, the precautionary principle has been weakened in the Climate Change Convention. It is less strong than the one in the Rio declaration.

In order to protect the environment, the precautionary approach shall be widely applied by States according to their capabilities. Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Principle 15, Rio Declaration)

3. "The Parties should take precautionary measures to anticipate, prevent or minimize the causes of climate change and mitigate its adverse effects. Where there are threats of serious or irreversible damage, lack of full scientific certainty should not be used as a reason for postponing such measures, taking into account that policies and measures to deal with climate change should be cost-effective so as to ensure global benefits at the lowest possible cost. To achieve this, such policies and measures should take into account different socio-economic contexts, be comprehensive, cover all relevant sources, sinks and reservoirs of greenhouse gases and adaptation, and comprise all economic sectors. Efforts to address climate change may be carried out co-operatively by interested Parties." (Climate Change Convention, 1992)

A comparison of these two enunciations of the precautionary principle indicate that the principle has been considerably weakened in the Climate Change Convention where it has moved from "shall" to "should", and where there is no mention made of the need to prevent environmental degradation. The Rio Declaration, though adopted by the global community by consensus, is not legally binding, whereas the Convention, is legally binding. However, in using the term "should" in a legally binding document the framers have perhaps given it no more status that it had in a non-legally binding document with "shall"

There are a number of constraints present in the Convention on Climate Change that were absent in the recommendations from the 1988 Convention. First of all, in 1988, there was a willingness to go beyond the "sovereign right to exploit resources" to perceive of the problem in global terms, and to opt, through international standards, for a form of international environmental governance. In the Climate change convention, the "sovereign

right to exploit resources" (albeit with the traditional trans-boundary proviso) is enshrined:

Recalling also that States have, in accordance with the Charter of the United Nations and the principles of international law, the sovereign right to exploit their own resources pursuant to their own environmental and developmental policies, and the responsibility to ensure that activities within their jurisdiction or control do not cause damage to the environment of other States or of areas beyond the limits of national jurisdiction,

This appears to be somewhat qualified in the fourth principle of the Climate Change Convention by indicating that states have the sovereign right not "to exploit their own resources" but to "sustainable development."

The Parties have a right to, and should, promote sustainable development.

Another constraint, is the discouraging of strong unilateral environmental action. In the climate Change convention, not only has there been a reluctance to go beyond relatively established state environmental standards to high international standards, but also there has been an admonition to individual states which may seek high environmental standards that could be construed with interfering with international trade:

5. The Parties should co-operate to promote a supportive and open international economic system that would lead to sustainable economic growth and development in all Parties, particularly developing country Parties, thus enabling them better to address the problems of climate change. Measures taken to combat climate change, including unilateral ones, should not constitute a means of arbitrary or unjustifiable discrimination or a disguised restriction on international trade.

A further example of the ambivalence between "concern and interest" appears to be present in the following paragraph of the Climate change convention. The first part of the paragraph appears to place a strong obligation on individual states to take measures "to mitigate" or "limit" anthropogenic emissions and "to protect and enhance sinks." Yet at the same time, advocate "strong and sustainable economic growth," at a time when sustainable development may not be sustained growth.

(a) Each of these Parties shall adopt national 2 policies and take corresponding measures on the mitigation of climate change, by limiting its anthropogenic emissions of greenhouse gases and protecting and enhancing its greenhouse gas sinks and reservoirs. These policies and measures will demonstrate that developed countries are taking the lead in modifying longer-term trends in anthropogenic emissions consistent with the objective of the Convention, recognizing that the return by the end of the present decade to earlier levels of anthropogenic emissions of carbon dioxide and other greenhouse gases not controlled by the Montreal Protocol would contribute to

such modification, and taking into account the differences in these Parties' starting points and approaches, economic structures and resource bases, the need to maintain strong and sustainable economic growth, available technologies and other individual circumstances, as well as the need for equitable and appropriate contributions by each of these Parties to the global effort regarding that objective. These Parties may implement such policies and measures jointly with other Parties and may assist other Parties in contributing to the achievement of the objective of the Convention and, in particular, that of this sub-paragraph;

In 1988 in the NGO recommendations there was a call for the need to provide development opportunities for the poor, and the NGOs linked need with the environmental threat. Although it is implied that the NGO recommendation refers primarily to "humanitarian" development rather than "increasing"—exploitative development (Delegate from Senegal, personal communication, New York Prep Com, 1992). The NGO recommendations does not explicitly make this distinction.

It is imperative for governments and the international community to sustain the agricultural and marine resource base and provide development opportunities for the poor in light of this growing environmental threat to global food security. (Conference statement, 1988)

The commitment to future generations is also indicative of this ambivalence: in the preamble there is a statement indicating that the signatories from the global community are "Determined to protect the climate system for present and future generations".

Yet, in principle 1. it is indicated that the commitment is not in the form of a legally binding mandate but of a discretionary principle — "the Parties should protect the climate system for the benefit of present and future generations of humankind, on the basis of equity and in accordance with their common but differentiated responsibilities and respective capabilities."

The question that the segment of the global community, that is concerned about global warming, may be left with could be "will the implementation of the Climate change Convention reflect the high ground in the document — actions to address the global warming issue, or will the document be used to devise and justify a new set of pseudo "techno-eco fixes" — such as the cutting down of old growth trees and replacing them with fast growing tree plantations.

### 3.5. A THOROUGH AND TRANSPARENT REVIEW OF THE OECD GUIDELINES FOR MULTINATIONAL ENTERPRISES

The OECD Guidelines for Multinational Enterprises are up for review this year.

#### 3.5.1. Given the enormous influence Trans National Corporations have

on investments, trade, environmental and social policies globally, we call upon the OECD to promote strict international performance standards for such companies. The Guidelines should be brought into coherence with the requirements of sustainable development as outlined in Agenda 21.

3.5.2. The review must be a cross-ministerial exercise and with regard to the OECD Secretariat, the Environment Directorate must be fully involved from the very beginning.

3.5.3. We call for a review process that is transparent and accessible for citizens' organizations, and in particular we call for consultation procedures of environmental, consumer, human rights, workers Organizations, both from inside the OECD as well as third countries.

3.5.4. The Guidelines should include confirmation that they also apply to the operations outside the OECD-countries of MNE's with their headquarters inside an OECD-country.

3.5.5. All OECD countries should set up formal contact points to facilitate and monitor the implementation of the guidelines.

1993 REPORT TO BUSINESS COUNCIL FOR SUSTAINABLE  
DEVELOPMENT  
JULY 10 1993  
DRAFT: FOR COMMENT ONLY

JOAN RUSSOW  
Sessional Lecturer  
Global Issues in Sustainability  
Environmental Studies

## INTRODUCTION;

Although there were systemic constraints which prevented UNCED from fully addressing the urgency of the global situation, there were many significant acknowledgements and principles which emerged from UNCED. (See Annex 1 for suggested "Systemic Constraints Preventing Change,"). The UNCED Documents, such as the non-legally binding Agenda 21 and Rio Declaration were agreed to by consensus by the member states of the United Nations. Although Agenda 21 and the Rio Declaration are not legally binding they hopefully will carry significant weight as "soft" law or as documents of moral suasion. Within these documents are a set of significant principles (see Annex ).

In this report, I will examine principles from the UNCED documents, describe what some institutions are doing to implement these principles and make suggestions about where, I think, the Business Council could make a significant contribution.

## **1. COMPLYING WITH THE ROLE ENVISIONED FOR BUSINESS AND INDUSTRY IN ENVIRONMENTAL TRAINING**

### **1.1. LIMITED YET SIGNIFICANT ROLE FOR INDUSTRY IN TRAINING IN ECOLOGICALLY SOUND EMPLOYMENT**

In chapter 36 of Agenda 21, a very important distinction is made between promoting "education," promoting "public awareness," and promoting "training." It appears to be clear in Agenda 21 that non-governmental organizations, community-based groups, women's groups and aboriginal groups are called upon to assist educational authorities in reorienting education. The role of industry is ascertained to be limited to specific areas of business and industrial and training programs.

" Educational authorities, with appropriate assistance of non-governmental organizations, including women's and indigenous peoples' organizations should promote all kinds of adult education programmes for continuing education in environment and development, basing activities around elementary/secondary schools and local problems. The authorities and industry should encourage business, industrial and agricultural schools to include such topics in their curricula. The corporate sector could include sustainable development in their education and training programmes". (Agenda 21, Chapter 36.5 I

In the section of Agenda 21 that addresses the " promoting of public awareness " industry is included not as the dispenser of "education" but as the recipient of needed education.

" Countries and regional organizations should be encouraged, as appropriate, to provide public environmental and development information services for raising the awareness of all groups, the private sector and particularly decision makers." (Agenda 21, section 36.10 c)

In the section of Agenda 21, that addresses the "promoting of training, an important role for industry is envisioned.

"To strengthen national capacities,... in training, to enable governments, employers and workers to meet their environmental and development objectives and to facilitate the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know -how" ( Agenda 21, 36.13 c)

The Business Council could make a significant contribution not by attempting to determine the philosophical underpinnings of Education, but in facilitating the transfer and assimilation of new environmentally sound, socially acceptable and appropriate technology and know -how within industry.

### *1.2. The Business council could promote "Principle-based education among its members"*

Here is an outline of a course I will be giving for teachers in the Faculty of Education on Principle-based education

#### ED B 408 Contemporary Issues in Education: Principle-based education

In 'principle-based education,' principles related to preventing the destruction of the environment, the escalation of war, the violation of human rights, the disregard for social justice and the perpetuation of inequity have been extracted from internationally endorsed documents. These internationally endorsed principles become the foundation for an educational program.

Often in "education about issues," in the name of objectivity, a "both-sides" approach is advocated. Issues are presented as reflecting different values, and because of the difference, opposing views are considered to be legitimately introduced. In this "both-sides" approach often students are encouraged to explore positions which may be in contradistinction to principles that have been endorsed by the global community. The justification for this "both sides" approach is often the need to counteract indoctrination through "value-based" education .

A distinction, however, could be made between indoctrination and principle-based<sup>1</sup> education. In indoctrination the values that are presented are usually those that comprise the belief system of the educator, whereas in principle-based education the principles around which the lessons are developed are drawn not from an educator's particular belief system but from international law.

In principle-based education, the foundation of the course is based on principles derived from international agreements, such as the following:

"Universal Declaration of Human Rights," International Covenant of Social, Cultural Rights; Stockholm Conference on the Human Environment; UN Conservation of Natural Heritage, 1972; Convention on International trade in Endangered Species of Wild Fauna and flora (Washington), 1973; UN Charter of Economic Rights and duties of states 1974; OECD recommendations on the analysis of environmental consequences of significant projects 1974; the World Charter of Nature, 1982; Paris Convention for the prevention of Marine Pollution from Land-Based Sources Global Biodiversity Strategy 1986; Montreal protocol on substances that deplete the ozone layer 1987; Convention on the Rights of the Child 1989; Convention for the Control of trans-boundary movements of hazardous wastes Basel Convention 1989; the Caracas Declaration 1992; Biodiversity Convention, Climate Change Convention and Agenda 21, 1992 )

1 "Principle-based education" was introduced in 1985 in Russow, J. "A Method of teaching Human Rights;" In this publication, the concept of "principle-based issue education" and the method of "Issue-principle analysis" were introduced. In this publication, "the violation of Human Rights" was extended to include the destruction of the environment, the escalation of war, the disregard for social justice and the perpetuation of inequity.

In this course, the nature, the implication, the educational processes, and the implementation of principle-based education will be explored in the following way:

- through description of the philosophical underpinnings of principle-based issues education
- through documentation of fundamental principles that emerged from UNCED and from other international conventions, declarations, conferences and agreements (Russow, J. "200 + principles from UNCED documents: Implications for Global Action." 1992)
- through explanation of an approach to principle-based education. In this approach, the instructor begins with principles, and then, with the students, examines issues that emerge from these principles. The following is an outline of a range of possible processes that never to be followed sequentially.
  - Location of principle within "International principle interactive diagram"
  - Statement of principle
  - exploration of principle

- emergence of issues within principle
- actual cases related to principle
- application of principle to actual cases
- adjustment of principle in response to cases
- hypothetical case analysis
- application of principle to hypothetical cases
- adjustment of principle in response to hypothetical cases
- clarification of principle
- determination of action to support principle
- engagement in action
- justification of action

After examining the issues emerging from the principles, the class expand, refine or extend the initial principle.

- through preparation of interactive international principle diagram. Through this international principle diagram students will be able assess which principles relate to issues have been globally endorsed, ratified, and enforced, which principles are globally endorsed and ratified but not enforced. Also through this diagram students will be able to begin to examine the problem of discrepancy between what is said and what is done. ( or between rhetoric and action) ( See Russow, J and White, D. (1992) Ideagraphic mode of Analysis and Synthesis of Issues: paper commissioned by the Greater Victoria School Board)
- through a series of class discussions and lesson plans based on 'issue-principle analysis," related to a wide range of local and global concerns. Thinking about the complexity and interdependence of issues will be encouraged, as well as the need to attempt to find tentative resolutions based on the full examination of the principles and issues.
- through experimentation with the following prepared materials
  - a document containing a selection of fundamental principles that emerged from UNCED and from other international conferences and agreements, and a series of class discussions and lesson plans based on 'issue-principle analysis," centred around these principles
  - an "international principles diagram" which will expand on the diagram "what is or is not protected?," a diagram that was an integral part of "a Method of Teaching Human Rights"(Russow, 1985). Through this international principle diagram students will be able assess which principles related to issues have been globally endorsed, ratified, and enforced, which principles are globally endorsed and ratified but not enforced. Also through this diagram students will be able to begin to examine the problem of discrepancy between what is said and what is done. ( or between rhetoric and action)
  - a series of " 'Cradle to grave, ' or 'life-cycle' Approach Dissemination Diagrams" on various industries. This 'life-cycle/cradle to grave' approach was fully endorsed by the global community in the Agenda 21 document at UNCED.

Through these diagrams, students will be able to understand the complexity of the interconnections involved in the introduction of an industrial activity into an ecosystem, and thus the implications of engaging in a particular industrial activity. It is only when students can see the "cradle to grave" or "full life cycle" approach that they will be able to assess whether the introduction will or will not violate internationally endorsed and ratified principles. (See Uranium Cycle diagram)

- a series of interconnected computer graphic programs, which connect a series of complex charts of various issues. Through this program the students will be able to examine the complex interaction of global issues, and then through a graphic selection program access complex diagrams of individual issues. Through this series of interlocking diagrams, students will be able to appreciate the interdependence of issues, and the confluence of aspects within each issue.

1.2. The business Council could also be involved with developing course material for education of managers.

Here was a course proposal that I co-developed with a professor in Public Administration for a course for MBA course on the management and the environment. (See Annex 2 for outline of proposal)

## **2. ESTABLISHING ENVIRONMENTAL PROVISIONS WITHIN THE CHARTERS OF INCORPORATION OF TRANSNATIONALS ALONG WITH THE POWER TO REVOKE CHARTERS IF THE CONDITIONS OF THE CHARTER WERE NOT BEING MET**

"to promote a 'culture of safety' in all countries ..." (Agenda 21, 7.60, Disasters)

Richard Grossman (1993), an environmental lawyer from the United States has traced the history of the granting of charters to corporations in the US. He indicates that

there was an early tradition in the United States for "citizens [making] certain that legislators issued charters, one at a time and for a limited number of years. They kept a tight hold on corporations by spelling out rules each business had to follow by holding business owners liable for harms or injuries and by revoking charters. (6)

The Business Council could initiate the introduction, in business charters, of environmental provisions which comply with principles from international documents, monitor the compliance with these principles and call for the revoking of charters if the provisions were not being complied with. The 1994 Conference on Public Interest and Environmental Law will be focusing on this issue.

### **3. ESTABLISHMENT OF CRITERIA FOR AND PREPARATION OF LIFE CYCLE ANALYSIS OF SUBSTANCES AND ACTIVITIES**

One of the principles enunciated in Agenda 21 was that there should be life cycle analysis. If this principle is to be acted upon, serious consideration should be given to a full analysis of the environmental impacts of each stage of the processing and production of substances.

Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits ( 20.20 e Hazardous wastes)

"[promote efficient use of materials and resources, taking into account all aspects related to life cycles of products.] 9.15 e

"risk reduction involves broad-based approaches to reducing the risks of toxic chemicals, taking into account the entire life cycle of the chemicals. (19.45, Toxic chemicals)

" Governments and international organizations, together with the private sector, should develop criteria and methodologies for the assessment of environmental impacts and resource requirements throughout the full life cycle of products and processes." (Agenda 21, 4.20)

In the past few years many industries have adopted environmental policies. In some cases, these policies may include the full operation— life-cycle — of the industry and in other cases these policies are marginal to the full life cycle of the industry. A significant role for the Business Council could be to set up an independent arm's length body to carry out a full life cycle analysis of products, activities, substances etc.. This life cycle could involve a full assessment of the environmental impact of each stage and of "all aspects" of production.

### **4. ENCOURAGING PRINCIPLE-BASED DECISION MAKING RATHER THAN ROUNDTABLE INTEREST-BASED DECISION MAKING**

One of the outcomes of the Brundtland report in Canada was that Canada institutionalized the multi-sectoral interest-based roundtable to make decisions about "sustainable development" or "sustainability— economic, social and environmental." It appears that this approach has only become prevalent in Canada and that Canada has been advocating the adoption this approach in the international sphere of decision making.

Although a multi-sectoral approach appears to be all-inclusive, its inclusivity depends on the nature of the sectors, on the selection process to determine the nature of the sectors, on who determines the nature of the sectors, on who is selected to represent the sectors, on the method of selecting the individuals representing the sectors, and on whether the sectors are interest-based or conceptually based

... Underlining an interest based multi-sectoral approach is the presumption that the best way to make decisions is through negotiated outcomes rather than reasoned outcomes (distinction made

in Science Council publication, 1984, "Regulating the regulators") with each member functioning on the basis of self-interest. This model of decision making — in an arena of competing interests — often leads to the compromising of principles and possibly to the lowest common denominator. This model of decision making could also be described as the "manufacturing of consensus model" where each sector for practical and participatory purposes eliminates the extreme positions — the positions which could be more principled and could lead to a better overall decision.

This approach is based on the premise that "balanced" decisions will emerge through consensus within an arena of competing interests. One outcome of this approach is that this arena of competing interests could be seen to be in violation of "conflict of interest" legislation. For years those who have been seen to have a conflict of interest have been excluded from the decisions making process [from panels, juries, boards. The multi-sectoral interest-based approach appears to almost glorify conflict of interest.

In a conceptually based or principle-based decision making approach the members are not participating because they have a particular vested interest but because they wish to arrive at an overall decision based on the highest tenable principles.

## **5. ADVOCATING THE NEED FOR PRECAUTIONARY, NOT ONLY MITIGATIVE ENVIRONMENTAL IMPACT ASSESSMENT REVIEW**

A precautionary review is one that attempts to prevent environmental degradation and cultural inappropriateness of a project by examining the potential environmental and cultural impacts of a project to determine whether the project should be allowed to proceed; the outcome of a precautionary review could be a decision to prevent the project from proceeding. A mitigative review, however, is one that attempts to lessen the environmental degradation and cultural inappropriateness of a project which has already been permitted to proceed; the outcome of a mitigative review would not be a decision to prevent the project from proceeding.

Throughout Agenda 21 there is reference to environmental impact assessment; in some cases it is not clear whether preventive or mitigative environmental impact assessment is envisioned.

Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42 Settlement )

" Develop improve and apply environmental impact assessments to foster sustainable industrial development (9.15 b. Atmosphere)

" Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the

assessment of the impacts of relevant policies and programmes on biological diversity” (15.5 k Biological diversity)

" Development of public education programmes directed at decision makers and the general public to encourage awareness and understanding of the relative benefits and risks of modern biotechnology, according to ethical and cultural considerations." (16.16 b, Biotechnology)

In the following sections, it is clear that a precautionary environmental impact assessment is envisioned:

" a precautionary and anticipatory rather than a reactive approach is necessary to prevent the degradation of the marine environment. This requires inter alia, the adoption of precautionary measures, environmental impact assessments, clean production techniques, recycling, waste audits and minimization, construction and/or improvements of sewage treatment facilities, quality management criteria for the proper handling of hazardous substances, and a comprehensive approach to damaging impacts from air, land and water” (17.22. Marine)

“States, in accordance with the provisions of the United Nations convention on the Law of the Sea on protection and preservation of the marine environment, commit themselves, in accordance with their policies, priorities and resources, to prevent, reduce and control degradation of the marine environmental so as to maintain and improve its life-support and productive capacities. ” (17.23 Marine)

To this end, it is necessary to

" apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it;" ( 17.23 a Marine)

" Ensure prior assessment of activities that may have significant adverse impacts upon the marine environment”; (17.23 b Marine)

' In order to promote and strengthen international cooperation in the management, including control and monitoring, of trans-boundary movements of hazardous wastes, a precautionary approach should be applied.” (20.33 Hazardous wastes)

"States, in cooperation with relevant international organizations, where appropriate, should ...b) encourage the London Dumping convention to expedite work to complete studies on replacing

the current voluntary moratorium on disposal of low-level radioactive wastes at sea by a ban, taking into account the precautionary approach, with a view to taking a well informed and time decision on the issue” (22.5 Radioactive wastes)

" Governments should take the lead in establishing and strengthening, as appropriate, national procedures for environmental impact assessment, taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction” (20.20 e Hazardous wastes)

“ Governments, according to their capacities and available resources and with the cooperation of the United Nations and other relevant organizations, as appropriate, should promote and support the integration and operation, at the regional and local levels as appropriate, of institutional and interdisciplinary groups that collaborate, according to their capabilities, in activities oriented towards strengthening risk assessment, risk management and risk reduction with respect to hazardous wastes” (20.25 a Hazardous wastes)

See Annex 3 for An example government's failure to make the distinction between preventive and mitigative environmental assessment reviews.

## **7. Advocating the polluter pay principle even when it might require retroactive compensation**

In both the hazardous waste section and the solid waste section of Agenda 21 the polluter pay principle was advanced

“ Governments should include in national planning and legislation an integrated approach to environmental protection, driven by prevention and source reduction criteria, taking into account the 'polluter pays' principle, and adopt programmes for hazardous waste reduction, including targets and adequate environmental control” (20.20 b Hazardous Wastes)

" Governments should ...(b) apply the 'polluter pays' principle, where appropriate, by setting waste management charges at rates that reflect the costs of providing the service and ensure that those who generate the wastes pay the full cost of disposal in an environmentally safe way” (21.42 b Solid wastes)

The business Council could advocate that when it can be shown that through non-compliance with statutes, and acts industry has caused environmental harm, any request for compensation by industry should take into consideration past environmental costs. For example, section 60 of the Forest Act of B.C. provides for the suspension of tree farm licensees if the licence holder, through non-compliance with the Act, has caused harm to the natural environment. Throughout B.C. environmentalists have been documenting

and submitting evidence of non-compliance to the Forest Act. The Fisheries Department has documented evidence of violation by the forest industry of section 33 of the Fisheries Act. Yet, this section of the Act has never been enforced. The cost of the environmental harm that has arisen from non-compliance with the act should be taken into consideration when the forest industry requests compensations for areas withdrawn from their tree farm licence.

### **8. Questioning the exclusion of atomic wastes from "hazardous" wastes or dangerous material categorizations**

In Agenda 21, atomic wastes are not included in the section of Hazardous wastes. For years atomic wastes have been excluded from international documents addressing the production, transportation and disposal of hazardous wastes. This special status has very serious implications for example, in the recent ruling of the Court, re: the calling for an environmental assessment review of Nuclear armed and nuclear powered vessels, the judge was able to state that an order in council bypassing an environmental review of these visits under the Environmental Assessment Review Process, was justified because it did not violate any existing statute such as the Canadian Environment Protection Act (which does not include hazardous wastes under hazardous wastes section). (See Annex 4, for a comment on the role of the IAEA as both a promoter and regulator of Atomic Energy)

Note also that atomic

Perhaps the Business Council of Sustainable Development could suggest that atomic wastes be included in hazardous wastes [along with the suggestion that nuclear energy should be phased out... I'm sure that would be a popular suggestion in France — I have heard that at least 6 of the civil reactors in France have cracks in them -- again hear say, contact John Carlier, vice president of the "Collectif Environ, a Dimension, Inter." Paris for details if you are interested, in "names and places" ]

### **9. Advocating the true assessment of Environmental costs**

In Agenda 21 there was several statements indicating the need to assess the true environmental costs.

Adopt policies that minimize if not altogether avoid environmental damage, whenever possible (7.42 a Settlement ) social costs of environmental

[Continue research and other work aimed at developing methodologies and criteria for incorporating the social costs of the environmental and other impacts caused by industrial production, as well as the treatment and disposal of wastes generated, into the prices of the final products;] (9.15 d)

" a lack of awareness of the environmental costs incurred by sectoral and macroeconomic policies and hence their threat to sustainability (14.7 a. agriculture)

(It is necessary to (17.5 Marine) " promote the development and application of methods, such as national resources and

environmental accounting, that reflect changes in value resulting from uses of coastal and marine areas, including pollution, marine erosion, loss of resources and habitat destruction

Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits” ( 20.20 e Hazardous wastes)

It also appears that the need to assess the true environmental costs is also a preoccupation of the Auditor General of Canada [misplaced citation]

The Business Council could seriously consider advocating that its members be obliged to take into consideration and make available to the public the full environmental costs of the production activities and substances

#### **10. ADDRESSING THE PROBLEM OF OVERCONSUMPTION; DILEMMA CAN BUSINESS/INDUSTRY STILL FUNCTION IN "ECO-EFFICIENCY" ( HARRIS, TERM COINED BY BCSD) AND DISCOURAGE "OVERCONSUMPTION"**

Problem of the relationship between production and consumption is currently being addressed within the OECD. The Environment representative of OECD also requested information related to over-consumption, and to alternative ways of reducing consumption.

In Agenda 21 there was several references criticizing current mode of consumption, unsustainable consumption or over-consumption [even though the US desperately tried, and in some cases succeeded in eliminating reference to "consumption"]. In one exchange in Rio the US Reilly indicated that over-consumption in the US contributes to needed development in the South. I have both the hard copy version of pre-Rio Agenda 21 with the bracketed sections — most of them at the instigation of the US- and the computer version of the Rio version. It is interesting to compare what was still included in brackets in New York and what was eliminated in Rio. The following statements are ones that were altered or eliminated in Rio:

[ one of the most serious problems now facing the planet is that associated with historical patterns of unsustainable consumption and production, leading to environmental degradation, aggravation of poverty and imbalances in the development of countries.]” (4.3 Changing consumption patterns)

["Health and development are intimately interconnected. both insufficient development leading to poverty and inappropriate development resulting in over-consumption, coupled with an expanding world population, can result in severe environmental health problems in both developing and developed nations. ]( 6.1 Health)

[While poverty largely results in certain kinds of environmental stress one of the most serious problems now facing the planet is that associated with historical patterns of unsustainable

consumption and production, leading to environmental degradation, aggravation of poverty and imbalances in the development of countries] ( 4.3.)

[ Special attention should be paid to the demand for natural resources generated by unsustainable consumption and to the efficient use of those resources consistent with the goal of minimizing depletion and reduction pollution. Although consumption patterns are very high in certain parts of the world, the basic consumer needs of a large section of humanity are not being met. This inequitable distribution of income and wealth results in excessive demands and unsustainable lifestyles among the richer segments, which place immense stress on the environment. The poorer segments, meanwhile, are unable to meet food, health care, shelter and educational needs. Change consumption patterns will require a multi-pronged strategy focusing on demand, meeting the basic needs of the poor, and reduction wastage and the use of finite resources in the production process. ] 4.5 note: section put in brackets by U.S. " States should pay special attention to efficient use of natural resources consistent with the goal of minimizing depletion and reducing pollution. This would help countries to meet their peoples food health care shelter and educational needs. The poor suffer from environmental degradation that can deepen the problem of development in particular as they struggle with agricultural problems and problems of health, hygiene which are endemic to the poor. At time environmental degradation caused by the consumptive patterns of others can intensify the environmental problem the poor face. Poverty is closely linked to environmental stress." ( U.S Suggestion for alternative to 4.5)

The following are statements that were retained in the final Rio version:

- **Increase in global population**

"The growth of world population and production combined with unsustainable consumption patterns places increasingly severe stress on the life-supporting capacities of our planet. ..." (5.2, Demographic dynamics)

- **Extent of air, water and land pollution**

" In many locations around the world the general environment ( air, water, and land), workplaces and even individual dwellings are so badly polluted that the health of hundreds of millions of people is adversely affected. This is, inter alia, due to past and present developments in consumption and production patterns and lifestyles, in energy production and use, in industry, in transportation etc. with little or no regard for environmental protection. " ( 6.40, Protection of health)

- **Nature of inequity between "developed" and "undeveloped" states**

" In industrialized countries, the consumption patterns of cities are severely stressing the global ecosystem, while settlements in the developing world need more raw material, energy, and economic development simply to overcome basic economic and social problems." (7.1. Settlement )

- **Extent of environmental damage from waste accumulation**

" The environment is threatened in all its biotic and abiotic components: animals, plants, microbes and ecosystems comprising biological diversity; water, soil and air, which form the physical components of habitats and ecosystem; and all the interactions between the components of biodiversity and their sustaining habitats and ecosystem. With the continued increase in the use of chemicals, energy and non-renewable resources by expanding global population, associated environmental problems will also increase. Despite increasing efforts to prevent waste accumulation and to promote recycling, the amount of environmental damage caused by over-consumption, the quantities of waste generated and the degree of unsustainable land use appear likely to continue growing." (16.22 Biotechnology)

- **Unprecedented Increase in environmentally persistent wastes**

" Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally persistent wastes at unprecedented rates. The trend could significantly increase the quantities of wastes produced by the end of the century and increase quantities four to fivefold by the year 2025." (21.7 Solid wastes)

- **Consumptive patterns**

"Achieving the goals of environmental quality and sustainable development will require efficiency in production and changes in consumption patterns in order to emphasize optimization of resource use and minimization of waste. In many instances, this will require reorientation of existing production and consumption patterns that have developed in industrial societies and are in turn emulated in much of the world." (4.15 Changing consumption patterns)

"Measures to be undertaken at the international level for the protection and enhancement of the environment must take fully into account the current imbalances in the global patterns of consumption and production" (4.4 Changing consumption patterns)

" Developing countries should seek to achieve sustainable consumption patterns in their development process, guaranteeing the provision of basic needs for the poor, while avoiding those unsustainable patterns, particularly in industrialized countries, generally recognized as unduly

hazardous to the environment, inefficient and wasteful in their development processes. This requires enhanced technological and other assistance from industrialized countries..." (4.8 c Changing consumption patterns)

" to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity "( 4.7.a Changing Consumption Patterns)

" to develop a better understanding of the role of consumption and how to bring about more sustainable consumption patterns."(4.7.b Changing Consumption Patterns)

It would appear that the consumption and development link has to be also examined in relation to "north" development, such as cash crops in "south"

The Business Council could give valuable assistance to OECD in their deliberations about "over-consumption"

#### **11. CALLING FOR THE BURDEN OF PROOF FROM THOSE THE OPPONENTS OF AN INTERVENTION HAVING TO DEMONSTRATE HARM TO THE PROPONENTS OF THE INTERVENTION HAVING TO DEMONSTRATE SAFETY**

A version of the shifting of the burden of proof was delineated in the World Charter of Nature. UN Resolution 37/7 (1982) endorsed by all UN states except the US.

Section 11 b Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature and where potential adverse effects are not fully understood, the activities should not proceed.

#### **12. PROMOTING ENVIRONMENTAL PROVISIONS IN TRADE AGREEMENTS AND DISMISSING AS INAPPROPRIATE THE EXCLUSION OF ATOMIC WASTES**

##### **•Increased generation of nuclear wastes**

" Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste ( as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. The high-level waste contains about 99 percent of the radionuclides and thus represents the largest radiological risk". (22.1. Radioactive wastes)

1. (GATT Working group on Export of Domestically prohibited goods and other Hazardous substances report by the Chairman of the working Group July 2 1991)

GATT

(GATT Working group on Export of Domestically prohibited goods and other Hazardous substances report by the Chairman of the working Group (restricted) July 2 1991)

[Note that the only country which did not agree to this document] was the U.S. The U.S. submitted a "communication" proposing the following changes" ; the U.S. changes will be noted in Italics. ]

Report by Chairman of the working group on Export of Domestically prohibited goods and other hazardous substances [ note linking with " non-transference of goods that are harmful to the environment or to human health] principle in Rio Declaration

At present, although the attached text has been generally agreed by delegations, the country [US] making the reservation remains unable to accept it without amendments.

## Decision on Products Banned or Severely Restricted in the Domestic Market

### Preamble

Desiring to further the objectives and principles of the GATT  
Having regard to the provisions of the GATT as they apply to the products covered by this Decision;

Desiring further to encourage the development of international rules on trade in products that are banned or severely restricted in the domestic market of a contracting party, as well as hazardous wastes, on the grounds that they are dangerous to human, animal or plant life or health, or the environment;

Desiring further to ensure that such rules do not create unnecessary obstacles to international trade nor duplicate the work of other international organizations;

Recognizing the need for complementary action in GATT regarding trade in products covered by this Decision, while taking into account the important contribution that is being made by international organizations which have competence in the areas concerned.

Noting the importance of notification, information exchange systems, prior informed consent procedures and certification systems developed by other international organizations in exchanging information and in assisting contracting parties in deciding whether to permit importation of the products concerned.

Recognizing that every contracting party must assume full responsibility for decisions regarding its own imports, but that the co-operation of exporting contracting parties may be necessary in cases where the importing contracting party's control procedures are not yet fully developed;

Bearing in mind that no contracting party should be prevented from taking measures to ensure the quality of its export products, subject to the requirement that such measures are not applied in a manner that would constitute a means of arbitrary or unjustifiable discrimination between contracting parties where the same conditions prevail, or a disguised restriction on international trade;

Mindful of the need for governments to pay the fullest attention possible to the protection of the environment;

Hereby decide as follows:

## Article 1

### Coverage

#### 1.1. for the purpose of this Decision

(i) A banned product means any product that has been:

(a) prohibited from sale or use, including those cases in which prohibition results from expiration of the approved period of use;

or

(b) refused approval for sale or use; or

c) withdrawn from sale or use

(ii) A severely restricted product means:

a product for which virtually all sales and /or uses have been banned but for which certain specific sales and/or uses remain authorized.

With regard to pharmaceuticals, this includes only those

(a) which are approved and subsequently subjected to restrictions that excluded their use in a substantial proportion of potential target population of patients having regard to its safety, and /or

(b) which contain a substance whose dangerous properties require extraordinarily narrow content limitations.

1.2. This Decision applies to products, substances and wastes (hereinafter referred to as " the products concerned") which are determined by a contracting party:

(i) to present serious and direct danger to human, animal or plant life or health or the environment in its territory, and which for that reason are banned or severely restricted in the domestic market of that contracting party by governmental regulatory action, except:

(a) fissionable and radioactive materials; and

(b) arms, ammunition and implements of war supplied directly or indirectly to a military establishment

Atomic wastes

## 11 CRITICISING LIMITED VIEW OF APPLICATION OR RELEVANCE OF AGENDA 21 AND OTHER UNCED DOCUMENTS

" It was clear that GATT Contracting Parties welcomed warmly the Rio Declaration and the progress that has been made by the UNCED in fostering further multilateral cooperation, and were determined that GATT should play its full part in ensuring that policies in the fields of trade, the environment and sustainable development are compatible and mutually reinforcing. ( Agenda-21 follow-up Activities in GATT at its meeting on 14-25 June 1993)

Although GATT claims to "welcome" the Rio Declaration there are two principles in the Declaration which could have significant impact of trade which may not be that welcoming to the business community:

### Precautionary Principle

" Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." ( Rio Declaration, 1992).

### Not-transferring-environmentally-harmful-activities or substances principle

States should effectively cooperate to discourage or prevent the relocation and transfer to other states of any activities and substances that cause severe environmental degradation or are found to be harmful to human health ( Principle 14, Rio Declaration)

The Business Council for Sustainable Development could assist GATT in understanding the implications of the two above principle.

Also in this document ( Agenda-21 follow-up Activities in GATT at its meeting on 14-25 June 1993), it is indicated that the follow-up will consist primarily in addressing those matters raised in chapter 2 of Agenda 21 ( trade liberalization— 2, intro, A; trade and environment supportive — 2, B; propositions and principles in 2.21, 2.22 (a),(b),(h) and (k). ... In November 1993, the Council of Representatives will hold a meeting devoted to this ... UNCED follow-up.

I have enclosed a list of almost 200 principles, not from Chapter 2, which are related to trade and environment. Perhaps the Business Council for Sustainable Development could bring to the attention of GATT before its November meeting, that there are many significant principles beyond chapter 2 of Agenda 21.

## **11. ASSESSING WHETHER PRACTICES THAT HAVE BEEN CRITICIZED BY ECOLOGISTS AND LAUDED BY RESOURCE INDUSTRIES ARE IN FACT ENVIRONMENTALLY AND ECONOMICALLY SUSTAINABLE**

5.1. "Undertaking to analyze whether the current practices of logging are in fact environmentally and economically sustainable, and if they are not too seriously look into alternatives." (Business Council of Sustainable Development)

## OECD

Contradictions "sustainable economies" "sustainable growth and employment" "sustainable development" (not used "sustainable environment").

Council of the OECD met on 2 and 3 June 1993 at Ministerial level... and the following communique was released:

"Ministers are committed to a concerted strategy for growth and employment. It consists of the following planks, described in detail in this communique

- ... monetary and fiscal policies will exploit the opportunities that may exist...without jeopardizing the objectives of price stability and medium term budget consolidation;
- ..structural reform policies, including labour market policies , will aim for vigorous, competitive and efficient development of OECD economies, exploiting opportunities offered by technological progress and open international competition;
- ... intensive efforts will be made to continue to liberalize trade, to abide and further strengthen multilateral disciplines and as the first priority to achieve a substantial , comprehensive and balanced outcome of the Uruguay Round by the end of the year. which would be a very powerful contributor to bolstering confidence, growth and employment both in OECD Members and elsewhere.

Promoting sustainable growth and employment: the major challenge for the 1990s

## YET

In the same communique the environmental policy is described as the following:

19. Genuinely sustainable development over the long term requires worldwide co-operation. OECD member countries intend, even in this period of economic downturn, to continue to play a leading role in the field of sustainable development, including in their commitment to follow up to the outcome of the United Nations Conference on Environment and Development (UNCED). They commit their governments to take effective action aimed at:

- achieving, at the national, regional and international levels, more effective integration and compatibility of environmental and all other relevant policies.

In this regard they welcome the overall progress made by the OECD in this field, including the programme of environmental performance reviews. Ministers ask the OECD to pursue its follow-up to UNCED, and in this regard, to consider the **feasibility of analyzing the relation between consumption and production patterns and sustainable development**; [ this phrase was highlighted by the Environmental representative (personal communication, June 28). the representative also indicated that OECD would be focusing on "over-consumption", and requested information ]

- More effective use of the variety of available economic instruments, in combination with regulatory and voluntary measures taking into account of national circumstances, to address global, regional and national environmental problems -- with the goals of cost-effective, viable results, including reduction of greenhouse gas emissions, through national and international agreed actions;
- promoting environmental protection through various forms of international co-operation, including relevant international legal instruments; and
- promoting national and international efforts in the development and diffusion of technologies aimed at protecting and restoring the environment.

### **Annex 1; systemic Constraints preventing change**

The following "systemic constraints," may have prevented the global community at UNCED from addressing the urgency:

- the continued willingness to enshrine the sovereign right to exploit natural resources.
- the unwillingness to move beyond sovereign barriers to international environmental governance
- the failure to recognize that the situation is so urgent that international environmental governance ,standards and regulations have to be necessary
- the refusal of states to accept the rule of international law
- the reluctance to establish stringent international environmental standards and technological regulations
- the unwillingness of states to allow for a stringent monitoring program
- the reluctance to recognize that the urgency of the current global situation requires the summoning up of the international political will to move from "should" to "shall"
- the obsession with consensus which may lead to the lowest common denominator rather than striving through collaboration for the highest tenable principles
- the decision making process being conceived as an arena of competing interests
- the designation of failure made by those states, institutions and individuals who do not even live up to the moderate principles established by consensus
- the reluctance to redefine what constitutes development in an ecologically sound way
- the unwillingness to redefine development in terms of ecologically sound practices; such as
  - (i) the degree to which a state has been able to integrate with the ecosystem through ecological sound practices causing its human activity to have little deleterious impact on the environment
  - ii) The degree to which there is an equitable distribution of resources
  - iii) the extent to which a state refrains from contributing to global ecological or military harm

iv) The degree of condemnation, and avoidance of over-consumption

v) the ability to minimize the human impact on the environment through stabilization of population

vi) the degree of compliance with the enshrining of positive rights (right to ecologically sound work, to food, to shelter as well as with negative rights)

(vii) the ability to live within the carrying capacity of the ecosystem; in which case the US could possibly be the least developed

- the stereotyping of countries into categories of "developed, underdeveloped, and developing" rather than designating behaviours and attitudes as being "developed, underdeveloped and developing";
- the simplistic distinction between North (environment) and South (development)
- the presumption that technological transfer should always pass from "North" to "South"
- the revelation of a problem and the presentation of a solution which could have more disastrous or equally disastrous consequences as the problem (nuclear)
- the continued justification and rationalization about the use of ecologically unsound practices in the guise of technological fixes
- the condoning of technological fixes suggested as solutions:
- the continued condoning of research and development into rectifying the harm done through ecologically unsound practices rather than discontinuing ecologically unsound practices (the Green Revolution syndrome)
  - the presence and use of international short term economic provisions which justify the abandoning by sovereign states of high ecological standards. (present in GATT regulations, and evident in Chapter 2 of Agenda 21 "Social and Economic Dimensions.")
- the reluctance of GATT to consider the applicability of any chapters other than Chapter 2
- the persistence of the situation whereby the power to prevent environmental harm or to preserve environmental heritage resides in those whose interest it is to benefit economically from the environment. and that in whose interest it is to benefit economically from the environment tend to ignore ecologically sound practices
- the persistence of the co-option, often through government funding, of groups, whose role should be to act as the conscience of the official decision makers
- the persistence of the situation where those who should be speaking out are constrained because of professional commitments, and where those who are willing to speak out are not heard because the press fails to report their statements
- the sanctioned use of "words of delusion" that either delude the public into thinking that what is unsafe, is safe, or delude the public into thinking that there is the political will to eliminate unsafe practices.
- the sanctioned use of loophole vague terms like "as appropriate" or of loophole provisions like *without prejudice to international trade*

*principles*. For example in the following section on consumption They should therefore review the purchasing policies of their agencies and departments so that they may improve, where possible, the environmental content of government procurement policies, *without prejudice to international trade principles*. ( 4.23, Consumption)

- the sanctioned use of the "notwithstanding clause" device. This device allows for the indulging in strong statements about deep concern and the need for significant change and then including a notwithstanding clause that negates the strong statement.

" Implement, as a matter of urgency, *in accordance with country-specific conditions and legal systems*, measures to ensure that women and men have the same right to decide freely and responsibly on the number and spacing of their children and have access to the information, education and means, as appropriate, to enable them to exercise this right *in keeping with their freedom, dignity and personally held values, taking into account ethical and cultural considerations*.

(3..8 j Combating Poverty)

- the sanctioned use of oxymorons like "the environmentally sound management of hazardous wastes" (20.22 Hazardous wastes) or "the promoting the safe and environmentally sound management of radioactive wastes" (Chapter 22 Radioactive wastes)

- the sanctioned use of term like "harmonizing" which usually leads not the highest tenable principles but to the lowest common denominator

- the reluctance to deal with essential issues such as the link between "Nuclear civil reactors and Nuclear Arms Industry" or the Link between Poverty and lack of universal " secondary" as well as "primary" health care system (3.6. e Combating Poverty)

- the reluctance to address the environmental degradation caused by military operations

("Systemic Constraints preventing change," Russow J. & White, D. in progress)

### **1. 3. Some fundamental principles that would probably be agreed to by Environmentalists as being principles that should form the basis of Environmental education:**

- The ecosystem has inherent rights in itself beyond human purpose (Charter of Nature, 1982)

- the realization that the traditional consumptive patterns of development have contributed to poverty, to the inequitable distribution of resources, to overconsumption, to the violation of human rights and to the potentially irreversible degradation of the ecosystem

- the realization that the threats to the biosphere which sustains all life on this planet have increased in rate, magnitude and scale that inaction is negligent. The international community has enough information about the pending state of ecological irreversibility that it must act immediately.

- The ecosystem of which we are a part shall be protected and preserved; ecologically unsound patterns of development shall be condemned and the inequity of development must be addressed and rectified. The mandate to limit growth must prevail
- The precautionary principles shall be extended to require those who wish to intervene in the ecological commons to have to justify their intervention and demonstrate the safety of their intervention. The full environmental costs shall be considered in any proposed development project that may cause ecological harm
- Development activities that benefit the few while compromising the biological inheritance, and quality of life of the many must be condemned as being inherently and ethically wrong
- Most of the third world debt was accumulated as a result of development that was inequitable and detrimental to the ecosystem; remedial and restorative measures shall be undertaken to address the inequity and ecological harm. The third world debt shall be forgiven and redirected for the purpose of addressing inequity and of restoring the ecosystem. While all are responsible for improving environmental quality, those who disproportionately consume the majority of the Earth's resources and pollute the natural environment shall bear the bulk of the costs of ecological restoration and protection.
- States shall not have the sovereign right to exploit resources within their territories. All actions within states must comply with high international ecological standards
- International ecological standards shall be in place so that no short term individual pursuit of self-interest, or short sighted national or international regulations ( GATT) could jeopardize the environment. The purpose of these standards is to address the individual and multinational pursuit of self-interest and to prevent the consumption and exploitative use of the environment and not to penalize local communities that wish to function in an interdependent way with the ecosystem. The economic development necessary to eliminate poverty shall not be a mandate to abuse the environment for either short-term gain or economic growth.
- The international community shall condemn and shall disallow the exporting of products deemed to be unsafe in a state where there are advanced testing procedures to other states with less advanced testing procedures. No products or activities shall be

transferred to other states if the transfer could cause harm to health or to the ecosystem.

- The continued build-up of the military complex must cease, and the use of military forces as a means of resolving conflict must be rejected. A radical reduction of the military budgets of the world must occur, and the funds released for ecological and humanitarian purposes.

- The decision making process shall be clearly defined, transparent, accessible and equitable. Criteria in decision making shall be revealed, and the public and affected communities should be involved at the time of formulation of the terms of reference and throughout the process.

Solutions should strive for the highest tenable principles not the lowest common denominator. (Issue under discussion should be reflected upon for a prolonged period of time in order to achieve an optimum solution, rather than simply a compromise)

- Behaviour and attitudes rather than countries should be categorized as "developed, " "developing" or "underdeveloped." The contribution of those people who have been "truly developed" in that they have succeeded in living in interdependence with the ecosystem shall be recognized and their advice sought"

(principles submitted to Canadian Environmental Educators for consideration. These principle were derived from Russow, "Composite Charter" July, 1992, from statements and contributions by NGO to the Earth Charter, at the Global forum, 1992)

## **Annex 2 Draft proposal for MBA course in Environment (pre-UNCED)**

### **INTRODUCTION**

Increasing awareness of the urgency of the global environmental situation has generated a frantic search for solutions. There have been pressures on governments, institutions, individuals and industries to constrain economic growth and to change unsustainable patterns of consumption and resource use. These pressures are multi-directional, both externally and internally derived. The response to these pressures has manifested itself in a) compliance response (an abundance of newly framed environmental laws and regulations at the international, national and local government levels), b) a self-regulatory response ("fox guarding the coop") (a proliferation of proclamations, declarations, charters, codes devised by industries to convey the impression that not external but only internal regulations are required); c) : technological fix

response a plethora of new products and processes ( reflecting a fundamental belief in the power of technology to solve all) that will rectify the harm created by ecologically unsound products or processes thus permitting the continuation of those unsound products and processes. d) "MEA culpa syndrome" response. ( public confessions by industry about how they failed to consider the environment in the past; confessions accompanied by resolutions to be ecologically prudent) ...( environmental accountability)

As the multi-directional pressures mount there will be a concerted effort to calculate the full environmental costs of not giving primacy to the environment in the decision making process. The possibility of income-generating ecologically sound activity being more economically viable than some traditional but ecologically unsound resource extraction activities must also be considered.

In the face of multi-directional pressures to act in an ecologically sound way and of multiple responses proposed as solutions, what might the role of the manager be? In the past the managers' role has often been reactive rather than proactive with the managers' actions demonstrating the clarity of hindsight rather than the wisdom of foresight. In the following outline, a series of 12 or so seminars on the nature of the multi-directional pressures, on the various approaches to address these pressures, and on the "systemic constraints" are proposed.

### 1. PRESSURE FROM THE INDEPENDENT SCIENTIFIC COMMUNITY

In this seminar we will examine the pressure from the independent\* international scientific community through its predictions of actual and potential environmental consequences. We will also address the problem that many regulatory decisions are based on non-arm's length research funded and carried out by industry or funded by industry and carried out by Universities.

\*independent in that it does not have a vested interest in a particular industry

#### Bibliography:

Publication from Royal Society of Canada, Global Conference, held in Kingston, June 7-9, 1991; Global conferences.

## 2. PRESSURE FROM A MORE INFORMED ELECTORATE AND INFORMED ENVIRONMENTAL MOVEMENT

In this seminar we will examine the pressure from a more environmentally informed electorate, and the need to recognize that the traditional role of governance is changing; the electorate no longer expects the elected officials to govern without public consultation. The informed electorate expects to be able to influence and have input into the decision making process. We will also explore the need to move from token consultation where the informed electorate is involved essentially after the decisions have been made to participatory mechanisms where the informed electorate is an integral component of the decision making process.

## 3. a . PRESSURE FROM GOVERNMENT AGENCIES; REGULATIONS, MONITORING ENFORCEMENT

In this seminar we will examine the nature of the pressures reflected in international, national and provincial environmental legislation in place, and the need to eliminate the discrepancy between the rhetoric of laws and regulations on the one hand and the actions of monitoring and enforcement on the other hand. We will also discuss the need to revise and reform the basis and criteria for "environmental assessment reviews" and the need to change the onus of proof from those objecting to the proposal having to demonstrate harm to those proposing the proposal having to demonstrate safety, and the implications of shifting the onus of proof. and the infrastructures in place to enforce and monitor these laws and regulations.

B.C. Government Consultation Process

## 3. b PRESSURE FROM NON-GOVERNMENTAL ENVIRONMENTAL ORGANIZATIONS TO FORCE COMPLIANCE WITH REGULATIONS

In this seminar we will examine the nature of the pressure from non-governmental environmental organizations and the need to recognize that often it is members of the environmental groups that have a less specialized but more integrated experience in environmental issues. We will also address the need for managers to be informed about the extent of potentially harmful consequences that could result from each technology, process and product so as to be able to assess the extent of the provisions that are purported to address these consequences. Bibliography: Enforcement, RBA

#### 4 . PRESSURE FROM GOVERNMENT-SPONSORED AND SUPPORTED PUBLIC HEARINGS, ROUND TABLES

In this seminar we will examine the nature of the pressures reflected in government-sponsored public access to the decision making process, and the need to involve the public at significant stages of the decision making process such as at the time of the formulation of the terms of reference. We will also address the problem of informed public intervention versus obstruction and the problem of selection of the participants in government structured consultative bodies.???intervention { these consultative bodies are often weighted on the side of industry because the environmentalists are often perceived to be only one stakeholder, whereas the "exploitative" uses are perceived to have many stakeholders. ( consumptive versus non-consumptive uses). We will also assess the different decision making approaches used within these consultative bodies, such as conflict resolution, resolution dispute mechanism, "principle based decision making, " "highest tenable principle, " and the impact of the confrontational system evidenced by high profile environmental law suits.

#### Bibliography:

a content analysis of documents reflecting a)the composition of the boards, round tables etc., b)the mechanism for selecting the participants, c)the nature and time of the involvement in the process, and d) the willingness by government and industry to act upon the recommendations.

#### 5. PRESSURE FROM ASSOCIATIVE SEGMENTS IN SAME INDUSTRY AND ASSOCIATIVE INDUSTRIES

In this seminar we will examine the nature of the pressures from associative segments within the same industry and among linked industry, and the need to for full integration of environmental concerns in all corporate policy and decision. We will also address the implications of an ecologically sound industry using as a resource, products that themselves were not produced in an ecologically sound manner

## 6. PRESSURE FROM INSTITUTIONAL INVESTORS WHO WISH TO INVEST IN ECOLOGICALLY SOUND INDUSTRY

In this seminar we will examine the nature of the pressures for environmental change coming from investors who wish to invest in an ethical and ecologically sound way and the type of ethical and ecologically sound investment systems that are in place. We will also evaluate the criteria that is used to determine ethical and ecologically sound investment. [will evaluate the criteria that are used by investments companies to determine what constitute ethical investments.]

## 7. PRESSURE FROM SMALL SHARE HOLDERS WITHIN INDUSTRY

In this seminar we will examine the nature and range of pressures from shareholders in the company, and the need to make the shareholders aware of the environmental implications of current and proposed technologies, and processes involved in production. We will also address the need for shareholders to condemn the indulging in an end of pipe correction and to support the build-in-solution in decision making from beginning.

## 8. PRESSURE FROM CONSUMERS THROUGH CONSUMER BOYCOTTS

In this seminar, we will examine the nature of the pressure from International, national and local boycotts of ecologically unsound products practices and processes. We will also explore the implications of advocating boycotts that could have a detrimental effect on an industry that is itself ecologically sound.

## 9. PRESSURE FROM THE MEDIA

In this seminar we will examine the nature of the pressure from editorial comment, letters to the editor, position pieces and special features, and the need to analysis the ability of the newspapers to retain detachment in the light of the newspapers connection with industry. We will address the issue of the control of the media and the implications for objective reporting on the environmental issues that could jeopardize media interests; and the nature of the media influence in shaping public perceptions.

## 10 PRESSURE FROM PERSONAL CONTACTS WITH INDIVIDUALS AND WITH COMMUNITY GROUPS TO WHICH INDIVIDUALS FROM INDUSTRY BELONG

In this seminar we will examine the nature of the pressures from a range of categories of individuals, institutions, service clubs etc. to which individual members of industry belong.

We will also address the power of special interest groups and lobby groups who influence industry from behind the scenes.  
Bibliography:

#### 11. PRESSURE FROM THE INTERNATIONAL COMMUNITY THROUGH INTERNATIONAL LAW AND TRADE REGULATION

In this seminar we will examine the nature of the pressure from international environmental standards and from international trade regulations and the need to ensure that established environmental regulations that may be perceived to interfere with the free flow of trade will not be sacrificed. We will also address the problem of international trade regulations interfering with high state environmental standards and the problem of low state environmental standards not being required to be raised to higher international standards.

#### 12. PRESSURE FROM WITHIN CORPORATIONS

In this seminar we will examine the nature of pressure from within industry from upper, middle and lower management. We will also examine the accommodation of dissent in relation to the establish environmentally policy, and the role of the environmental whistle blower.

Bibliography: Public Administration documents

#### 13. RESPONSE 1.

Improved information and analysis. Resource accounting: full environmental accounting; "polluter pay principle"; economic instruments and property rights. Cost benefit analysis revised to include valuation of natural capital.

#### 14. RESPONSE 2.

Accountability to multiple "stakeholders"

#### CONCLUSION:

Traditionally industry has had to contend with only bidirectional pressure and accountability to maximize profit for shareholders, and fulfill government technical regulations, now industry is having to confront multi-directional environmental pressures and accountability . Industry's response was initially

to attempt to find loopholes in government laws and regulations, or to contest what appeared to be too high environmental standards; then industry entered into a response phase of reluctant compliance with government laws and regulations. Industry, because of a range of new pressures from consumers, soon recognized the need to appear "environmentally friendly"; this response involved a flurry of new environmentally friendly new logos, slogans and products. Soon industry, having to respond to a wider range of environmental concerns and realizing that eventually industry would be losing community support, recognized a new need: the need to appear "environmentally enlightened"; this response involved a flurry of environmental departments or sections within the industry, of declarations and charters embodying industry's commitment to the environment, and of a facade of environmental concern. As a result of all these measures an "environmental industry" appeared. This industry was and is in place to provide environmentally-friendly technological fixes for the ecologically unsound practices that drive industry. In all the above responses the pressures were essentially external; even when pressures to change come from within industry by shareholders, employees, and different levels of management, the pressures in a sense could still be deemed to be external in that industry has not internalized the values that would be needed to have a truly ecologically sound industry. The internalizing of environmental values, including those of equity and social justice, would require industry to recognize the primacy of the environment. There would have to be a shift in language and a change in perception. The onus of justification would have to change from those objecting to industry's intervention having to justify why they object, to industry recognizing that industry's interventions cause to withdrawing from the environmental heritage of the commons and that industry must justify this withdrawal. It will only be when industry has internalized the multiple pressures, and is willing to accept the primacy of environmental safety and environmental preservation, and is willing to ground their actions in principle.

The transition from the bidirectional pressure to multi-directional pressure may be bringing about the dissolution of the traditional roles and responsibilities of managers. Managers whose line of responsibility was well defined within the traditional industrial unidirectional model, might find a new sense of responsibility to multi-directional complex, fluid, indefinable, indeterminate body of pressures from consumptive interest groups and non-consumptive commons concerns .

## **Annex 1 An example of failing to make the distinction between preventive and mitigative environmental assessment reviews.**

[The Canadian government has refused to undertake an environmental assessment review of the Kemano Completion project, even though the Canadian government has made an international commitment "to ensure that decisions [about projects] are preceded by environmental impact assessments" and "to take into account the costs of any ecological consequences (Agenda 21,7.42). Canadian Law has also committed the Canadian government "to carry out an environmental assessment review to determine if the potentially adverse environmental effect that may be caused by a proposal are significant (S.12, EARP).

The Canadian government has also refused to assess the environmental and cultural impacts of the Kemano Completion project on native communities, even though the Canadian government has made an international commitment to indigenous people "to recognize that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate" {Agenda 21, 16.3 a (ii)}.

On January 19,1993, Premier Harcourt issued a press release "Premier Announces Review of Kemano Completion Project." Premier Harcourt's statement was misleading because he did not make a distinction between a "precautionary" and a "mitigative" review. A precautionary review is one that attempts to prevent environmental degradation and cultural inappropriateness of a project by examining the potential environmental and cultural impacts of a project to determine whether the project should be allowed to proceed; the outcome of a precautionary review could be a decision to prevent the project from proceeding. A mitigative review, however, is one that attempts to lessen the environmental degradation and cultural inappropriateness of a project which has already been permitted to proceed; the outcome of a mitigative review would not be a decision to prevent the project from proceeding.

The terms of reference of the proposed B.C. government's public review of Kemano Completion are *not* to determine whether the project should proceed but to assess the options for mitigating impacts associated with the Project." There is a significant distinction between undertaking to carry out an environmental assessment review of the Kemano Completion project to determine if the project should proceed, and undertaking a "public review" of the impact of the Kemano II project after the decision has been made to allow the project to proceed.

The Cheslatta Carrier nation, displaced by the Kemano I project, is advocating a review that, if carried out, would probably fully justify immediate mitigation of the impacts of the Kemano I project, and justify the prevention of the Kemano Completion project. In their proposed review, the terms of reference should include but not be limited to the following:

- a thorough investigation into all environmental, economic, social and cultural impacts of Kemano 1 , and prescribe immediate mitigation;
- a thorough review of the terms, conditions and circumstances surrounding the granting of Alcan's 1950 Nechako Water licence including a thorough review of the 1949 water licence 'hearings' held at Wistaria and Victoria

- a thorough review of the 1987 Nechako settlement Agreement, including into terms and conditions and 'mitigative' measures, and the circumstances that led to this settlement
- a full disclosure of all federal and provincial documents and involvement relating to the Kemano projects;
- the commissioning of an independent cost/benefit analysis of the Kemano projects;
- the commissioning of an independent environmental impact assessment of Kemano 2;
- a throughout investigation into possible violations of the Federal Fisheries Act and the provincial Water Act;
- a thorough investigation into power sale contracts between Alcan and B.C. Hydro;
- an investigation into whether Alcan is a 'public utility';
- a thorough investigation into the impact of the reduced water flows on the Nechako River on the concentration of municipal agricultural and industrial effluent;
- a thorough investigation into the past and present management of the Nechako Watershed;
- a thorough investigation of Environcon Ltd and Triton Environmental Consultants Ltd. (April 1993, Cheslatta Nation )

If the proposed Cheslatta review were carried out it could result in the restoration of the environmental degradation of Kemano I, and in the redress for the cultural impacts of Kemano 1. Their review could also result in the prevention of the Kemano Completion project. As pointed out by the Cheslatta band the cost of compensation for any loss that Alcan may have incurred for its preparatory work for Kemano Completion will be far less than the cost of past (Kemano I) and future (Kemano II) environmental degradation and cultural displacement. Any public review that does not fully investigate the impact of Kemano I, and does not have within the terms of reference the possibility of preventing the Kemano Completion project from proceeding is making a mockery of the precautionary principle and of the public process.

Annex 3

### **THE "NOT-TOO-HIDDEN AGENDA" OF THE INTERNATIONAL ATOMIC ENERGY AGENCY (IAEA) AT UNCED: NUKESPEAK, AND SEDUCTIVE DEVICES, DOCTRINES, DOGMAS, STRATEGIES AND FALLACIES**

By Fred Knelman and Joan Russow

Dr Fred Knelman is the Vice President of the Whistler Foundation for a Sustainable Environment, and Joan Russow, was the delegate for the Whistler Foundation at the New York Preparatory Committee for UNCED and at the Earth Summit at Rio. The Whistler Foundation and the Nuclear Age Peace Foundation had circulated a Declaration that was signed by 37 Nobel Laureates; this declaration called for the phasing out of Nuclear energy. They requested permission to read this declaration at one of the plenary session at Rio Centro; permission was denied.

The International Atomic Energy Agency (IAEA) was initially set up in the 1960's to regulate Nuclear energy; they have, however, become one of the

strongest proponents of nuclear energy. A fundamental regulatory principle of the "separation of function" is that "the agency entrusted for regulating a technology cannot be the same agency that promotes the use of that technology"(Knelman, 1975). IAEA , through its UNCED document entitled "Nuclear Techniques and Sustainable Development." acted as a major proponent, not only of the current use, but of the increased use of nuclear energy.

Agenda 21-- the 600 page far-reaching action-plan document from UNCED, was adopted unanimously by the global community represented at the Earth Summit in Rio. In Agenda 21 the following concern about radiation was expressed:

The deterioration of environmental quality, notably air, water and soil pollution owing to toxic chemicals, hazardous wastes, radiation and other sources, is a matter of growing concern. ( Chapter 16. subsection 12),

The extent of the consequences of the nuclear industry were also identified in Agenda 21:

Annually about 200,000 m<sup>3</sup> of low-level and intermediate- level waste and 10,000 m<sup>3</sup> of high-level waste ( as well as spent nuclear fuel destined for final disposal) is generated world wide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides increases. (Chapter 22, subsection 1)

Yet at one of the plenary sessions, Mr. Hans Blix, Director-General of the IAEA, was given permission to present a document advocating nuclear energy as being a safe alternative energy for the future. The International Non-Governmental Organizations, (NGOs), however, recognized that the fundamental regulatory principle had been violated, and gave IAEA, the dubious honour of being presented with the International NGO Community's "Most Preposterous Proposal Award" "for presenting nuclear power as the environmental solution in energy and successfully keeping its problems out of the documents."

We would like to highlight some of the SEDUCTIVE DEVICES, STRATEGIES, DOCTRINES, DOGMAS and FALLACIES that have made the IAEA worthy of this honour. The examples will be drawn from IAEA document which was prepared for UNCED. Also references will be made to other UNCED Documents such as Agenda 21 and the Rio Declaration-- the Earth Charter-- 1992, and the Canada's National Report for UNCED, 1992

The seductive devices, strategies and fallacies used by the IAEA all draw upon the fundamental language of 'nukespeak.'" Knelman (1986, 1992) has expanded on the euphemistic nature of Nukespeak: ( term first used in Hilgartner S., R. Bell, and R. O'Connor 1982) ‘

The rule is sanitize by euphemism: political euphemism is of course older than nuclear power. How many of us recognize the "elimination of unreliable elements"? There are forbidden words in the language of civil nuclear power. For example, the words "accident", "pollution" or "disease" are never used. Accidents are either "transients," "events," "significant events," "anomalies," occurrences," or "abnormal occurrences." In the extreme, they become "normal abnormalities," i.e. truth becomes lies. Explosions are "events of rapid disengagement" or "prompt criticality." Waste dumps are "residue areas." Thermal pollution becomes "thermal effects" and pollution becomes "impacts." Disease becomes "health effects"; This is a euphemism for cancer and genetic malformations. And missing plutonium, which is the link to clandestine acquisition of nuclear explosives is "material unaccounted for" or simply MUF! (Knelman, 1986.) Other names relating to nuclear accidents are criticality, nuclear excursions, abnormal evolution, normal aberration, plant transients, unnecessary ignition sources. "Nukespeak" is perpetuated through "nuclear acceptance campaigns" by the PR departments of the nuclear establishment, designed to find "palatable synonyms" for "scare words" through the use of "truth squads" in order to remove "undue public concern", create "pro-energy climate" where "technically qualified persons" would agree that nuclear power poses "no significant threat" and could be entrusted" for the timely detection of potential abnormalities, or there is "no evidence" of such threat ( as though lack of evidence is proof of assertion) and the promises that turned into lies i.e. that nuclear power would be "too cheap to meter" providing society with "boundless energy" and save us from "freezing in the dark"; this is the language of Orwell's 1984, where peace is war and truth is a lie." ( Knelman, 1992).

### **Seductive devices, doctrines, dogmas, strategies and fallacies**

#### **• The "blatant misrepresentation or expedient omission" device**

This device involves the convenient exclusion of any part that could be detrimental to one's position.

The IAEA through expedient omission (possibly for advantageous "clarification") has left out a significant section in Agenda 21 which does not include nuclear energy in the list of "safe" technologies for the future. To "clarify" Agenda 21, the IAEA in its UNCED document stated the following:

"The UNCED Agenda 21 notes the need for a transition to environmentally sound energy systems, which will entail major changes in the patterns of energy production and consumption" (IAEA Document, p.5, 1992)

In the Atmosphere chapter of Agenda 21, the following [safe] and sound technologies are advocated:

cooperate to increase the availability of capacity, capabilities and relevant technologies ...for utilizing and producing environmentally [safe and] sound renewable energy resources, such as solar, wind, geothermal, hydropower and biomass,... Each resource should be utilized in a manner that ... minimizes environmental stress and health impacts, .... (Section 9. Subsection 9 g Agenda 21, 1992)

Thus, we see that in the Energy section of Agenda 21, Nuclear energy is not mentioned as being one of the [safe] or sound technology.

- **The "co-opted terms" strategy**

This strategy involves the stipulating of a new definition for a term that would jeopardize one's own argument.

In the Rio Declaration the following precautionary principle was advocated:

Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." ( Rio Declaration, 1992).

In the following statement, the IAEA redefines the important precautionary principle that was agreed to in the Rio Declaration, 1992.

The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary (IAEA Document , p. 2, authors emphasis)

The Rio principle, however, if enacted and truly adhered to, would bring about a moratorium on new nuclear power plants while phasing out currently existing ones.

- **The "comparison of convenience" device**

This device involves the narrowing down of alternatives so that whatever aspect is compared will appear favourable to the proposed alternative.

In the following statement from the IAEA document, the IAEA narrows the alternatives used for comparison to those which would appear to be favourable within the terms of reference of their comparison. Thus, for example, they compare the relatively low volume of nuclear wastes to the much larger volume of wastes from fossil fuels. However, it is the volume of wastes multiplied by their toxicity that is significant. Merely comparing

volumes is a "comparison of convenience." The same false comparison is used to compare fuel requirements for the same energy output.

A nuclear plant would require 27 tonnes of slightly enriched uranium each year, which corresponds to a few truckloads. The corresponding quantity of natural uranium is 160 tonnes. a coal fired plant would need 2.6 million tonnes of coal each year... which corresponds to the load carried by 5 trains, each transporting 1400 tones every day  
an oil fired plant would require 2 million tonnes of fuel oil per year, which is about 10 supertanker loads." (IAEA document, 1992, p.12)

The nuclear establishment never fails to compare coal and nuclear as competing energy sources, always claiming the inherent superiority of nuclear . Usually this is accomplished by failing to include the entire fuel cycle over its full life of impacts, social and environmental. They conveniently exclude "safety" factors, "production of wastes," "disposability of wastes," "degree of potential for bioaccumulation,;" lifetimes of wastes, toxicity and proliferation problems associated with nuclear wastes.

Yet no bombs are built of coal, no terrorist is interested in hijacking coal or in the clandestine acquisition of coal weapons, coal plants do not have to be decommissioned and mothballed after some 30 to 50 years of operation, their hazardous wastes do not have to be guarded for 100,000 years, coal dust is easier to contain than radon and coal plants do not require liability subsidies by acts of parliament" ( Knelman, 1992)

**• The "lull and lure of the technological fix" syndrome ( the "misleading assurance" device or the fallacy of "technological omnipotence")**

This syndrome, device or fallacy involves the revealing of the seriousness of the problem and the offering of a "solution" which is usually worse than the problem

The proponents of a potentially dangerous act indicate that they recognize the danger and focus on one area for which they can offer a technological fix

In the following statement from the Radioactive Wastes section of Agenda 21, into which it appears that the IAEA had input, the following situation is recognized:

Annually about 200,000 m<sup>3</sup> of low-level and intermediate-level waste and 10,000 m<sup>3</sup> of high-level waste ( as well as spent nuclear fuel destined for final disposal) is generated worldwide from nuclear power production. These volumes are increasing as more nuclear power units are taken into operation, nuclear facilities are decommissioned and the use of radionuclides

increases. The high level waste contains about 99 percent of the radionuclides and thus represents the largest radiological risk." ( Agenda 21, Radio Active wastes, 21.1.).

In the IAEA document the authors affirm the certainty of the technological fix.

There is nevertheless a consensus among experts that safe geological disposal of high level wastes, including spent nuclear fuel, is technically feasible. ( IAEA Document, p.17)

The view of experts in the field is that safe technological solutions exist for managing the waste. (IAEA Document, 1992, p. 15)

Knelman (1992) points out that

The assumption behind the notion of permanent disposal of High level wastes deep in a stable geological formation is false because this assumption relies on the mistaken belief that anything we do technologically can be permanent This assumption of permanence is particularly false when we are dealing with the lithosphere over some 100,000 years and when we must first disturb the geological structure by digging a very deep hole. AECL(Atomic Energy of Canada Limited) has dug a deep hole near Lac du Bonnet in Manitoba which is totally inappropriate for such so-called "permanent" disposal. For one thing you must, in all events, avoid water. Yet, The AECL hole must be soaked Walt Patterson, a nuclear critic described this AECL research as follows: A drunk has lost his keys and is discovered by a police officer crawling around a street light. When questioned, the drunk admitted that he had lost his keys in front of a dark building, a block away. When asked why the drunk was then searching around the street light, the drunk said " you see, officer, the light is better here" and as Dr Martin Resnik off, an expert on geological waste disposal has put it " the earth does not stand still. In other words, experts in the relevant fields do not agree. (Knelman, 1992, in progress)

• **The "rhetoric of notwithstanding clause" doctrine.**

This doctrine allows for the indulging in strong statements about deep concern and the need for significant change and then including a notwithstanding clause that negates the strong statement.

In the Rio declaration (1992) there is a strong statement about third world dumping:

States should effectively cooperate to discourage or prevent the relocation and transfer to other States of any activities and substances that cause sever environmental degradation or are

found to be harmful to human health.” (Principle 14 Rio Declaration, 1992)

(

There are, however, disturbing "notwithstanding clauses" that appear such as in the following statements:

“Develop regulatory and non-regulatory measures and procedures aimed at preventing the export of chemicals that are banned, severely restricted, withdrawn or not approved for health or environmental reasons, *except when such export has received prior written consent from the importing country or is otherwise in accordance with the PIC procedure*; ( Section 19. subsection 53 f ,” (Agenda 21, 1992)

In the following statement in the IAEA document, the IAEA energetically adopts the spirit of the " rhetoric of notwithstanding clauses"

“The IAEA in 1990 promulgated a Code of Practice on the International Trans-boundary Movement of Radioactive Waste as a basis for harmonization of national legislation and policies. The code lays down the conditions and principles for international waste transfers, such as that movement must be made in a manner consistent with the international safety standards, that there must be prior notification and consent of the sending, receiving and transit States, and that each State involved should have a regulatory authority...”( IAEA Document, 1992, p. 20

- **The "flamboyant absurdity" doctrine or dogma**

This doctrine or dogma carries the concerns of one's opponents to the point where the regulations governing the opponents concerns should become the standard by which other potentially lesser concerns will be addressed.

The IAEA appears to advocate that, what is considered to be the most dangerous industry, just because it is dangerous, has developed stringent standards, and that they who contribute to possibly the greatest uncontrollable hazard are the ones who should assist the community in dealing with other hazards.

The basic principles for radiation protection and safety in all applications and activities in nuclear science and technology are precautionary and are so well founded in science and so widely accepted that they are now also being regarded as a source of guidance in controlling pollutants and impacts arising from other human activities. Their wider application would undoubtedly contribute towards sustainable development. (p.2)

- **The "justification through dire consequences of alternatives" device**

This device involves the revealing of the dire consequences of the current practices and offering one own practice as the salvation for the problem

In the following statement the IAEA cites the dire consequences of the other alternatives to justify their proposed alternative:

The problem of acid rain, which is linked to emissions from the burning of fossil fuels, has been recognized for decades..... . the primary concern about the continued and increasing use of fossil fuels is the problem of CO<sub>2</sub> emission and the potential impact on world climate..... World conference on the Changing Atmosphere... need to reduce CO<sub>2</sub> emission (IAEA document, p. 5)  
climate change in connection with fossil fuels (p. 9)

#### •The "benevolent outcome exploitation" strategy

This strategy involves the selection of the outcome which the opposition to the proposed alternative would advocate and the subsequent attempt to demonstrate that the proposed alternative, which the opposition would condemn, would be the best way of achieving that outcome.

In the following statements from the IAEA document, the IAEA focuses on the desired outcomes of reducing acid rain and limiting greenhouse gas to justify the selection of their proposed alternative:

“Several governments have already made commitments to reduce carbon emission, while recognizing that this will be hard to achieve except through drastic policy decisions in the energy sector.” (IAEA Document, 1992, p.6)

“Nuclear power plants in normal operations cause very little environmental detriment and are beneficial when they replace plants which would emit CO<sub>2</sub>, SO<sub>2</sub>, and NO<sub>2</sub> (p. 12). In this respect they would help to reduce acid rain and limit greenhouse gas emissions” (IAEA Document 1992 , p. 12)

To accomplish the above, IAEA and other nuclear proponents are recommending the construction of some 4000 to 5000 new commercial nuclear power plants. The combination of the multi-trillion cost and the time required for construction renders this proposal no less than bewildering. By the 6 to 10 year period required for construction, other sources of climate-altering gases would wipe out all gains. Secondly at 1/7th to 1/10th the above cost, a much greater reduction in CO<sub>2</sub> and other climate-altering gases can be achieved through simple available conservation and efficiency measures.

#### • The "flaunting and condoning of the vicious circle principle" strategy

This strategy is best explained by the economic principle that "bad money drives out good." The opportunity costs of nuclear power are unacceptable and prohibitive. Thus, the money spent to subsidize nuclear power is at the expense of the funds required to solve the energy problem with safe alternatives, and consequently, because the research into alternatives will not be effectively carried out, the safe alternatives will not be able to adequately replace the non-renewable forms of energy.

"In the 1992 report to UNCED, following was stated:  
Nuclear energy has safety risks associated with the entire uranium cycle, from mining through processing to the ultimate disposal of high-level radioactive wastes. In addition, there are safety risks associated with the reactors used to generate electricity from uranium. And the use of fossil fuel to drive conventional thermal generation produces carbon dioxide and waste heat. (Canada's National report UNCED pp.46- 47)  
From a domestic consumption point of view, the least environmentally damaging energy option is energy efficiency." (Canada's National report UNCED p. 47)

Despite the above statement, the document concludes::

New, cleaner technologies such as solar energy may help, but the hard fact is that to a large extent we will have to rely on either thermal, hydro, or nuclear energy in the future. In addition, energy projects for both export and domestic supply provide jobs and economic wealth to the country, and are especially important in some regions of Canada" ( p. 47. Canada's National report UNCED June, 1992, authors' emphasis)

The Canadian government has invoked the "vicious circle principle" by cutting subsidies to conservation efficiency and renewals. Canada is thus playing an important role in facilitating this not too hidden agenda by using many strategies, devices, doctrines, etc.

## **CONCLUSION:**

The "nukespeak" and the seductive devices, strategies, syndromes used by the Nuclear Industry involve the language of delusion and distortion. Hopefully, through the continued revealing and categorizing of these words of delusion we could, in some small way, counteract the impact of the not too-hidden-agenda of the IAEA, and the rest of the nuclear establishment and their government supporters.

1993 Panellist: I will be presenting a paper "A Call to action: UN Proclamation for Translating Rhetoric into Action. At the International Conference, "Stop the Destruction of the World" in Paris in June

I was on a panel and presenting a paper A Call to action: UN Proclamation for Translating Rhetoric into Action. At the International Conference, "Stop the Destruction of the World" in Paris in June

I was organized by a group, **Trilogia Analítica** originated in Brazil by Norberto Keppe. The lectures were held downtown Paris at the Sorbonne until the Sorbonne determined that the group was a cult. What I remember about the group is that it APPEARED to be a group of professionals in different fields who were disenchanted with the status quo they had representatives primarily from Russia Brazil Finland and France drawing from a number of professions psychologists, psychiatrist, medical doctors artist and musicians and entrepreneurs. The members all stayed in a chateau that they purchased outside of town. I had stayed with Servas for a couple of days they arranged for me to stay in a convent. I arrived at the convent and noticed right away that there were cots without blankets and then I saw one in the corner. It was June and not too cold. I later found a place to stay in Paris with a woman who was with a Peace group International Institute for reconciliation. I was invited to the castle for an event and was talking with a Brazilian who owned a lot of property in the Amazon. One day he told me that his employees came up to him smiling but their children ran away from him. He realized how they really felt about him, he gave away all of his land and joined the group. Every day for special sessions.

After being told that they could not be associated with the Sorbonne The conference moved to an auditorium in Pigalle; there was an incredible Brasilia drumming group that gave a workshop on stimulating Brazilian culture against the onslaught of US influence. One night a famous flautist came specially from Sweden to play with the drumming group.

( ) **THAT** in June 1993, I attended the World Heritage Committee meeting, and I intervened and commented on the discrepancy between preamble and the operative clauses in the Convention on the Protection of Cultural and Natural Heritage. I had gone to UNESCO to raise the issue that in the preambular clauses of the convention there is a commitment to preserve sites of universal value, whereas in the operational clauses it is the responsibility of the state to determine which sites are universal value. It was clear to those concerned about sites in Canada, that the Canadian government along with provincial governments succumb to corporate pressure to not protect these areas. I asked if I could speak as an observer from Canada, and was granted the floor. I described the problem in Canada, where in British Columbia world heritage sites that are of universal value are being destroyed because of corporate vested interests, and thus the important commitment in the preambular clause is not being fulfilled.

After I spoke, a woman leapt to her feet and declared that I was not the official Canadian observer and that she was. I did not realize that the term "observer" was an official term designating the government representative, and as it was the first day of the meeting of the committee the president was not aware of the identity of the official representative, I returned later on in the week to the committee meeting, and was approached by the official Canadian government observer, and she told me that she had been on the phone with Harcourt and

Mulroney, and that a decision had been made to establish the Tatatcheni as a world heritage site.

### CONVENTION INTERVENTION AT THE WORLD HERITAGE COMMITTEE MEETING UNESCO JUNE 1993

#### CONVENTION FOR THE PROTECTION OF THE WORLD CULTURAL AND NATURAL HERITAGE (PARIS, 23 NOVEMBER 1972) (CPCNH)

Noting that the cultural heritage and the natural heritage are increasingly threatened with destruction not only by the traditional causes of decay, but also by changing social and economic conditions which aggravate the situation with even more formidable phenomena of damage or destruction, (CPCNH)

Considering that deterioration or disappearance of any item of the cultural or natural heritage constitutes a harmful impoverishment of the heritage of all the nations of the world, (CPCNH)

Considering that protection of this heritage at the national level often remains incomplete because of the scale of the resources which it requires and of the insufficient economic, scientific and technical resources of the country where the property to be protected is situated, (CPCNH)

Recalling that the Constitution of the Organization provides that it will maintain, increase and diffuse knowledge, by assuring the conservation and protection of the world's heritage and recommending to the nations concerned the necessary international conventions (CPCNH)

Considering that the existing international conventions recommendations and resolutions concerning cultural and natural property demonstrate the importance, for all the peoples of the world of safeguarding this unique and irreplaceable property, to whatever people it may belong, (CPCNH)

Considering that parts of the cultural or natural heritage are of outstanding interest and therefore need to be preserved as part of the world heritage for [mankind] as a whole, (CPCNH)

Considering that, in view of the magnitude and gravity of the new dangers threatening them, it is incumbent on the international community as a whole to participate in the protection of the cultural and natural heritage of outstanding universal value, by the granting of collective assistance which, although not taking the place of action by the State concerned, will serve as an effective complement thereto, (CPCNH)

Considering that it is essential for this purpose to adopt new provisions in the form of a convention establishing an effective system of collective protection of the cultural and natural heritage of outstanding universal value, organized on a permanent basis and in accordance with modern scientific methods, (CPCNH)

#### 1. Definitions of the Cultural and the Natural Heritage

##### Article 1

For the purposes of this Convention, the following shall be considered as "cultural heritage" monument: architectural works, works of monumental sculpture and paintings, elements or structures of an archaeological nature, inscriptions, cave dwellings and combinations of features, which are of outstanding universal value from the point of view of history, art or science: (CPCNH)

groups of buildings: groups of separate or connected buildings which, because of their architecture, their homogeneity or their place in the landscape, are of outstanding universal value from the point of view of history, art or science;  
sites: works of man or the combined works of nature and of man, and areas including archaeological sites which are of outstanding universal value from the historical, aesthetic, ethnological or anthropological points of view. (CPCNH)

#### Article 2

For the purposes of this Convention, the following shall be considered as "natural heritage": natural features consisting of physical and biological formations or groups of such formations, which are of outstanding universal value from the aesthetic or scientific point of view; geological and physiographical formations and precisely delineated areas which constitute the habitat of threatened species of animals and plants of outstanding universal value from the point of view of science or conservation;

natural sites or precisely delineated areas of outstanding universal value from the point of view of science, conservation or natural beauty (CPCNH)

#### Article 3

It is for each State Party to this Convention to identify and delineate the different properties situated on its territory mentioned in Articles 1 and 2 above (CPCNH)

## II National Protection and International Protection of the Cultural and Natural Heritage

#### Article 4

Each State Party to this Convention recognizes that the duty of ensuring the identifications, protection, conservation, presentation and transmission to future generations of the cultural and natural heritage referred to in Article 1 and 2 and situated on its territory, belongs primarily to that State. It will do all it can to this end, to the utmost of its resources and where appropriate with any international assistance and co-operation, in particular, financial, artistic, scientific and technical, which it may be able to obtain. (CPCNH)

#### Article 5

To ensure that effective and active measures are taken for the protection, conservation and presentation of the cultural and natural heritage situated on its territory, each State Party to this Convention shall endeavour, in so far as possible, and as appropriate for each country:

a) to adopt a general policy which aims to give the cultural and natural heritage a function in the life of the community and to integrate the protection of that heritage into comprehensive planning programmes; (CPCNH)

b) to set up within its territories, where such services do not exist, one or more services for the protection, conservation and presentation of cultural and natural heritage with an appropriate staff and possessing the means to discharge their functions: (CPCNH)

c) to develop scientific and technical studies and research and to work out such operating methods as will make the State capable of counteracting the dangers that threaten its cultural or natural heritage; and (CPCNH)

d) to take the appropriate legal, scientific, technical, administrative and financial measures necessary for the identification, protection, conservation, presentation and rehabilitation of this heritage; and (CPCNH)

e) to foster the establishment or development of national or regional centres for training in the protection, conservation and presentation of the cultural and natural heritage and to encourage scientific research in this field. (CPCNH)

#### Article 6

1. Whilst fully respecting the sovereignty of the States on whose territory the cultural and natural heritage mentioned in Articles 1 and 2 is situated, and without prejudice to property rights provided by national legislation, the States Parties to this Convention recognize that such heritage constitutes a world heritage for whose protection it is the duty of the international community as a whole to co-operate. (CPCNH)

2. The States parties undertake, in accordance with the provisions of this Convention, to give their help in the identification, protection, conservation and preservation of the cultural and natural heritage referred to in paragraphs 2 and 4 of Article 11 if the States on whose territory it is situated so request (CPCNH)

3. each State Party to this convention undertakes not to take any deliberate measures which might damage directly or indirectly the cultural and natural heritage referred to in Articles 1 and 2 situated on the territory of other States parties to this Convention (CPCNH)

#### Article 7

For the purpose of this Convention, international protection of the world cultural and natural heritage shall be understood to mean the establishment of a system of international co-operation and assistance designed to support States Parties to the Convention in their efforts to conserve and identify that heritage. (CPCNH)

### III Intergovernmental Committee for the Protection of the World Cultural and Natural Heritage

1. An intergovernmental Committee for the Protection of the Cultural and Natural Heritage of Outstanding Universal Value, called "the World Heritage Committee", is hereby established within UNESCO. It shall be composed of 15 States Parties to the Convention, elected; by States Parties to the Convention meeting in general assembly during the ordinary session of the General Conference of the UNESCO. the number of States members of the Committee shall be increased to 21 s from the date of the ordinary session of the General Conference following the entry into force of this Convention for at least 40 states. (CPCNH)

2. Election of members of the Committee shall ensure an equitable representation of the different regions and cultures of the world. (CPCNH)

#### Article 11

1. Every State party to this Convention shall, in so far as possible, submit to the World Heritage Committee an inventory of property forming part of the cultural and natural heritage, situated in its territory and suitable for inclusion in the list provided for in paragraph 2 of this Article. This inventory, which shall not be considered exhaustive, shall include documentation about the location of the property in question and its significance. (CPCNH)

3. The inclusion of a property in the World Heritage List requires the consent of the State concerned. The inclusion of a property situated in a territory sovereignty or jurisdiction over which is claimed by more than one State shall in no way prejudice the rights of the parties to the dispute. (CPCNH)

4. The Committee shall establish, keep up to date and publish, whenever circumstances shall so require, under the title of "List of World Heritage in Danger", a list of the property appearing in the World Heritage list for the conservation of which major operations are necessary and for which assistance has been requested under this Convention. This list shall contain an estimate of the cost of such operations. The list may include only such property forming part of the cultural and natural heritage is threatened by serious and specific dangers, such as the threat of disappearance caused by accelerated deterioration, large-scale public or private projects or rapid urban or tourist development projects; destruction caused by changes in the use or ownership of the land; major alternations due to unknown causes; abandonment for any reason whatsoever; the outbreak or the threat of an armed conflict; calamities and cataclysms; serious fires, earthquakes, landslides; volcanic eruptions; changes in water level, floods, and tidal waves. The Committee may at any time, in case of urgent need, make a new entry in the List of World Heritage in Danger and publicize such an entry immediately. (CPCNH)

#### Criticism of Maini representation

( ) THAT in 1993, I was selected by the British Columbia Environmental Network (BCEN) to attend the CEN meeting in PEI

#### COMMENT

At the 1993 meeting of the CEN in PEI, I moved a resolution proposing that the International Affairs Caucus do an independent report Card on Canada's compliance or non-compliance with UNCED. This resolution was passed unanimously by those present at the IAC meeting. I have been working on this report. I have extracted a series of principles and have determined what would constitute compliance with these principles in the Canadian context.

( ) **THAT** in 1993, I obtained the November 1993 document entitled "Environmental Assessment Review of NAFTA, and that I pointed out at public meetings the discrepancy between what was in the actual NAFTA agreement and what the Canadian government claimed was in the agreement [In article 103 of the NAFTA agreement, only three International Instruments were stated as taking priority over NAFTA: CITIES, Montreal Protocol on Ozone Depletion, and the Basel Convention [the few International environmental agreements ratified by the US] and the primacy of other International agreements would be subject to negotiation. The Canadian government had claimed in its 1993 document that Canada's International obligations would take primacy over NAFTA. I argued publicly that the Canadian government had misled the Canadian public about the primacy of international obligations.

( ) **THAT** from 1992 to 1997, I have criticized the Federal Government for failing to enact the necessary legislation to comply with international

obligations related to the Framework Convention on Climate Change and the Convention on Biological Diversity

( ) **THAT** in 1992 to 1994 , I sought, through the courts to overturn the injunction in Clayoquot Sound; that I argued that the Judge had failed to take into consideration Canada's international obligations and that the BC government was bound by the Convention on Biological Diversity and the Canadian government was in contravention of its obligations because of the actions in BC. I also argued that an injunction in an equitable remedy that moves with time and circumstance, and that the intention of an injunction was to prevent irreparable harm not to prevent those who strive to prevent irreparable harm from preventing harm.

APPEAL FROM FILE # C916306

APPEAL NO. VO1984

IN THE SUPREME COURT OF BRITISH  
COLUMBIA COURT OF APPEAL

BETWEEN:	MACMILLAN BLOEDEL	PLAINTIFF (RESPONDENT)
	JOAN RUSSOW	RESPONDENT (LEAVE TO APPEAL APPLICANT)

**TABLE OF CONTENTS:**

**PART I -STATEMENT OF FACTS  
PP. 5 — 8 (#1— #17). TAB 1**

**PART II. REASONS FOR APPEAL  
PP. 9— 12 (#18 — #24). TAB 2**

**PART III. MEMORANDUM OF ARGUMENT:**

**A. In the hearing of August 26, 1993, there was a failure to bring to the attention of the Honourable Mr. Justice Hall that the granting of the injunction could contribute to non-compliance with international obligations of Canada and its Courts, and that, in the September 15, 1993 application to rescind the injunction, the Honourable Mr. Justice Drake erred in his assessment of the relevance of international law. PP. 13 — 47 (#25 — #122). TAB 3**

- Performance of the treaty in good faith by ensuring the necessary conditions are in place for its performance of the treaty(Article 31, Convention of Law of Treaties) • International customary law affirmation of requirement to enact the necessary legislation • Affirmation of a requirement to enact necessary legislation prior to signing • Provisions for implementing legislation when subject under Provincial jurisdiction • All levels of Canadian governments, whether federal or provincial, and whether legislative, executive or judicial should endeavour in good faith to comply with treaties • Principles of guidance from relevant cases from High Court of Australia • Applicability of section in the Convention on the Law of Treaties on not defeating purpose of treaty from moment of signing (Article 18) • Applicability of the states being bound not to create the impossibility of performance Article 61 • Consideration of legally binding Conventions • Failure of federal government to ensure that the treaty obligations would be • Labour Convention case distinguished • Evidence of consultation with Provinces • Criteria derived from the Labour Convention Case for what would constitute "Consultation" with province • Biodiversity and Climate Change issues considered under residuary powers • Criteria for inclusion under section 91 residuary powers • Canada has been obliged not to invoke internal law to justify failure to perform international obligations • Canada has been in non-compliance since June 1992 because B.C. forest practices have been in contravention of provisions in the Conventions, and has defeated the purposes of the Conventions • B.C. government applying for an injunction and the Courts granting this injunction which had the result of permitting the continuation of practices that are in violation of the Biodiversity and Climate Change Convention, the courts have inadvertently encouraged non-compliance with international law • Canada is bound throughout its territory [including the provinces and territories] • Applicability of section in the Convention on the Law of Treaties on internal law not being invoked to justify non-compliance with obligations • Failing to identify Biodiversity, failure to carry out an environmental assessment, and failure to invoke the precautionary principles and protect carbon sinks •

Canada, through B.C. 's not fulfilling its duty to identify, protect and conserve natural heritage of outstanding universal value, such as Coastal temperate rainforest areas like Clayoquot Sound • Canada since 1972 has failed to discharge its obligation to protect the natural heritage of outstanding universal value for future generations • IUCN condemnation of forest practices and lack of adequate preservation of coastal temperate rainforests • Applicability of the Common Law Doctrine of Legitimate Expectations • Expectations related to fulfilling of obligations under globally adopted United Nations Agreements and resolutions • Non-compliance with globally adopted agreements: Caracas Declaration and Agenda 21

***B. This case also addresses the contempt for statutory law that has been demonstrated by industry, and in particular MacMillan Bloedel, in its non-compliance with statutory law, and by governments in their failure to enforce statutory law, particularly in relation to tree farm license (in the manner of a profit a prendre property right claimed by MacMillan Bloedel)***

**PP. 48 — 53 (#123— #136). TAB 4**

- B.C. has not only used internal law — the granting of injunctions to justify non-compliance to international obligations but has failed to invoke its own internal law to prevent violations of international obligations • MacMillan Bloedel in violation of statutory law • Evidence of violations of forest Act and failure of government and courts to enforce statutory law failure to invoke Sections of the Forest Act
- MacMillan Bloedel was aware of alternative economically viable methods of selection logging which would have enabled Mac Milan Bloedel to have fulfilled its obligations under the Forest Act and thus its obligations under the TFL which they claim bestows a property right • MacMillan Bloedel has been convicted under section 33 of the Federal fisheries Act for depositing deleterious substances which caused destruction to fish Habitat • Evidence of type of violations occurring throughout TFL •

Summary of the findings of the Tripp report which was entitled *The Application and Effectiveness of the Coastal Fisheries forestry guidelines in selected cut blocks on Vancouver Island* • Evidence of violations of the Forest Act, collected by the Valhalla Wilderness Society • Evidence through Forest Watch that MacMillan Bloedel violating Forest Act in Clayoquot • Failure to assess the costs of past ecological damage in assessing compensation for taking areas out of TFL • Non-fulfillment of condition of the granting of the license is that logging has to be "sustained"; evidence from leaked document from Inventory Branch of the Ministry of Forests demonstrating MacMillan Bloedel overestimating inventory by over 40% in Queen Charlottes cut block • Given that MacMillan Bloedel has been in violation over the years of many sections of the Forest Act, Waste Management Act and the Fisheries Act, MacMillan Bloedel has not fulfilled the conditions of the TFL under the Forest Act, and thus the contracting party has failed to perform its part of the contract. In this case it would be inappropriate to recognize that MacMillan Bloedel has a property right in the nature of a "profit a • Evidence the Court would recognize that a right cannot be claimed by one who has not fulfilled the responsibilities contingent upon that right.

**C. The appeal will rely upon a realistic and objective evaluation of equity. In particular the use of an equitable remedy such as an injunction to justify non-performance of provincial and federal statutory law and to justify non-performance of international legal obligations, and international customary law.**

**PP. 54 — 58 (#136— #147). TAB 5**

Evidence will be submitted that the injunction is an equitable remedy that has been misapplied in the Clayoquot case. Equity could never countenance the destruction of life rearing capacity and life forms in its trust on a massive scale with no genuine regard for future generations • The remedy [of injunction] of course, is an equitable one. "The exercise of the equitable jurisdiction is not to be restricted by the straitjacket of rigid rules but is to be based on broad principles of justice and convenience, equity regarding the substance and not merely the facade or the shadow. It moves with time and circumstances. (Justice J.A. Norris) • The requirement to preserve our environmental heritage and the requirement to save a representative sample of natural ecosystems for future generations have been recognized and have become part of international customary law • An equitable remedy— an injunction, is being used to prosecute citizens of criminal contempt when the justification for the granting of this equitable remedy is still being questioned by the courts • The "impossibility avoidance" or "the avoidance of a disappearing object principle": (not having object disappear while object is under consideration). This principle is enunciated as follows: claimant will not find at the end of a successful trial that the subject matter is gone • Embodiment of a principle of international customary law which is eloquently stated in the Vienna Convention on the Law of Treaties (Article 18 and 61): a state is obliged to "not defeat the object and purpose of a treaty prior to the entry into force" and not to make performance of the treaty impossible • The granting of the injunction would be in violation of the above principle because proceeding with logging when the logging could and would defeat the purpose of any treaty protecting the "ecological rights" within the public trust would defeat the purpose of the treaty • Implications of the principle ("impossibility avoidance" or "the avoidance of a disappearing object principle") should be considered in relation to the Public Trust Doctrine (Friends Patrai Doctrine) • Requirement to take into account the costs of any ecological consequences is a particularly relevant consideration in assessing "irreparable harm" in injunctions • An advisory opinion from the International Court of Law is going to be sought to determine whether Canada, through the actions of B.C. has been in violation of the Biodiversity Convention since the signing of the Convention in June 1992. Until this case is heard nothing should be done on crown lands which could diminish the value of the public trust rights • Since MacMillan Bloedel has been in violation of statutory law as well as international law it should not be able to benefit from the granting of an equitable remedy such as an injunction • Violations of guarantees in the International Covenant on Civil and Political Rights have occurred in the Clayoquot injunction trials (one Judge in response to a Clayoquot Arrestee's citing of a section from the International Covenant on Civil and Political Rights was "that sounds like some international something or other") • When all domestic remedies fail redress can be sought through the Optional Protocol of the International Covenant on Civil and Political Rights

**PART 1 -STATEMENT OF FACTS**

1. This is an application for Leave to Appeal Mr. Justice Drake's judgment in which he dismissed the Appellant's application to rescind the injunction that was extended by Mr. Justice Hall.

2. August 26, 1993 Mr. Justice Hall dismissed the two applications and granted the application of MacMillan Bloedel to extend the injunction.

3. September 15, 1993 Dr. Betty Kleiman and Joan Russow made an application to rescind the Clayoquot injunction.

4. September 17, 1993 Mr. Justice Drake dismissed the application.

5. October 21, 1993 Russow served a notice of leave to appeal Mr. Justice Drake's decision on MacMillan Bloedel.

6. November 8, 1993 MacMillan Bloedel filed a "Notice of appearance"

7. December 1993 Russow received correspondence from John Hunter, lawyer for Mac Millan Bloedel about participating in the Appeal that would be heard in Vancouver in late January. Russow informed MacMillan Bloedel that she was presenting a paper at the IUCN Annual General Meeting as a member of the IUCN Commission on Education and Communication, and consequently it would be impossible for her to be part of the appeal at that time.

8. Ron Adams, Clerk of the Appeal Court in Victoria, informed Joan Russow that she was under no obligation to appear at that time, and that even, if the injunction were overturned, she could still appeal Judge Drake's decision.

9. Ron Adams, Clerk of the Appeal Court in Victoria also informed Joan Russow that there was no particular time limit for proceeding with the leave to appeal application, and that only if MacMillan Bloedel sought to set aside the appeal would she be required to proceed expeditiously with the leave to appeal.

10. July 21, 1994 Russow filed a praecipe for a Leave to Appeal hearing and served it on MacMillan Bloedel. The proposed date for the Chambers hearing August 16

11. July 22, 1994 John Hunter sent a FAX in which he stated that he would be away on August 16 and wished to change the date and proposed alternatives later on in August. Joan Russow phoned him and expressed concern about the possibility of MacMillan Bloedel's applying for a new order prior to hearing the arguments presented in the Leave to Appeal, and asked him when MacMillan Bloedel would be proceeding with the application to extend the order. He declined to divulge that information. Russow then suggested that someone should appear in his place. She expressed surprise that he would be contesting the Leave to Appeal application, given that in the September 15 application he had stated that the proper place for the submission to be heard was in the Court of Appeal, and given that at the September 15 application he also stated that the issue of applicability of international law had never been raised:

the central point raised by the applicants as to the international law aspects of this, and the applicants are quite correct that no point was made before Mr. Justice Hall as to the international commitments that may have been made by Canada in Rio de Janeiro, by any council.  
(John Hunter, Transcripts of September 15, Application

He said that he would consult with his clients but would probably formally apply for an extension. No formal request for an extension was made.

12. August 5, 1994. MacMillan Bloedel served a Notice of Motion seeking to have the application of Appellant Joan Russow for Leave to Appeal be adjourned generally. (See response by Joan Russow in Affidavit, dated August 10, and sworn August 15, 1994)

In the Notice of Motion John Hunter stated that, "The injunction as extended by Mr. Justice Hall expires on August 31, 1994. No application to extend the injunction has been filed and I do not currently have instructions to bring such an application. Such an application may be brought, and I am prepared to ensure that Ms. Russow is advised if such an application is brought. On the other hand, such an application may not be brought."

13. August 7, 1994 with the above assurance, Russow canceled a trip so that she would be able to propose to John Hunter that she could accommodate John Hunter's initial request to adjourn the Leave to Appeal to a future date.

14. August 8, 1994 Given that John Hunter had written in his affidavit that he did not have "instructions to bring such an application [an application to extend the injunction], Russow contacted the office of John Hunter and proposed that if he would agree to adjourn the application to set aside the Leave to Appeal generally then she would agree to adjourn her application for a Leave to Appeal to August 23, one of the dates originally requested by John Hunter.

**EXHIBIT: A** Letter written by Russow to Hunter

15. August 8, 1994 Russow received correspondence from Davis & Company, the firm to which John Hunter belongs:

Mr. Hunter is away from the office until August 22, 1994 and in his absence Mr. Peter Voith is handling this matter, and Mr. Voith, however, is out of the office until August 9, 1994 at which time your fax will be brought to his attention.

**EXHIBIT: B** Response from Peter Voith

Russow had understood that the reason that Mr. Hunter had wanted to change the date of the hearing was that he believed:

it would be of assistance to the judge hearing this application if I were able to participate as counsel for MacMillan Bloedel to advise of any details in this course proceedings which may not be apparent from this Affidavit" (John Hunter, Affidavit, August 4, 1994).

16. August 9, 1994 10:15 a.m. There was no reply from Mr. Voith, and Russow continued to prepare her affidavit for the August 12th hearing of MacMillan Bloedel's application. Russow phoned at 10: 15 on Tuesday morning and was informed by Karen, John Hunter's secretary, that Voith had been there since 9:00 but with clients. Russow received a phone call from Shirley, Mr. Voith's secretary who said that he would be responding to my request later on in the afternoon. When Russow said that it was important for her to know as soon as possible because she had to file not only the Leave to Appeal book but also an affidavit for the August 12 application (both of which Russow would have had to have ready to submit on Wednesday, August 10), Shirley stated that he would be responding within 20 minutes. When Russow repeated "within twenty minutes" Shirley countered with it is his decision and he will respond as soon as possible.

At 11:00, Russow received a FAX indicating that he would be prepared to adjourn the Application to adjourn the Leave to Appeal generally, and would proceed with Russow's Leave to Appeal on August 23, as requested.

**EXHIBIT: C** Letter agreeing to adjourn Leave to Appeal Application to August 23, 1994

17. August 10 1994 Dr. Betty Kleiman, submitted a letter stating the reasons that she had not been able to be part of the Appeal, and expressed the wish that Merv Wilkinson serve in her place:

**EXHIBIT: D** Letter from Betty Kleiman. Re: Appeal  
**PART II - REASONS FOR SEEKING LEAVE TO APPEAL**

18. The issues of law that are raised in this application are of great import, and bring into question serious discrepancies between the legal obligations undertaken by Canada internationally, and the discharging of these obligations in Canada, both federally and provincially. This application also raises the issue that a positive duty is placed on states to enact the necessary legislation so as to enable the performance of treaties which have been signed by the Federal government with the endorsement of the government of British Columbia. In addition, this appeal will also raise questions of legal responsibility for non-compliance with and non-enforcement of international and statutory law, and with the implications arising from the non-performance of those legal responsibilities. Serious legal issues about the direction being taken within the administration of the law of equity will also be considered on this appeal. In particular, the issue that an equitable remedy— an injunction, is being wrongfully used to prosecute citizens for criminal contempt.

19. The implications of international law were not considered by either of the applicants, namely Greenpeace Canada and Valerie Langer, who were seeking to rescind the injunction before Mr. Justice Hall, on August 26.

At the September 15 hearing, before Mr. Justice Drake in this matter, John Hunter lawyer, for MacMillan Bloedel, affirmed that Mr. Justice Hall had not considered the international commitments:

Now the last thing I wanted to say, just to address the central point raised by the applicants as to the international law aspects of this, and the applicants are quite correct that no point was made before Mr. Justice Hall as to the international commitments that may have been made by Canada in Rio de Janeiro, by any council. (Transcript of application from September 15, 1993).

20. The international law and other grounds for rescinding the injunction, presented by Dr. Betty Kleiman and Joan Russow in the September 15 submissions, were not more than cursorily considered and were not given a fair hearing.

On September 15, 1993 Dr. Betty Kleiman and Joan Russow made an application to rescind the Clayoquot injunction order dated August 26 and

pronounced by Mr. Justice Hall on the following grounds outlined in the oral submission and the exhibits submitted to Judge Drake.

1. Failure to bring to Mr. Justice' Hall's attention that the granting of the injunction could contribute to non-compliance with international obligations
2. Failure to bring to Mr. Justice Hall's attention that the Clayoquot TFL's, are rights in the light of a "profit a prendre", which is a conditional right, and entails a complementary responsibility. Non-compliance with statutory law and previous convictions by the forest company, MacMillan Bloedel, should have been taken into consideration when the equitable remedy of an injunction was granted
3. Failure to bring to the judge's attention that the injunction is an equitable remedy moving with time and circumstances.

On September 17, 1993, Mr. Justice Drake ruled:

Mr. Hunter informs that an application for leave to appeal from the order of Mr. Justice Hall is afoot and is set down for hearing in the Court of Appeal on Tuesday next... In these circumstances, there is no point in dealing with the extensive submission of the applicants, interesting as they were (From p. 2-3 transcript of judgment, September 17).

21. John Hunter also submitted to the judge a copy of an article on international law by L.C. Green in which the 1937 case, *Attorney-General for Canada v Attorney-general for Ontario*. Supreme Court of Canada A.C. 1937, pp. 326 -354 [Labour Convention Case] was submitted as evidence that B.C. was not bound by international law. There was no opportunity to distinguish this case from the present case because Hunter submitted the written document to the judge without orally introducing the case into his submission. In the appeal, the relationship between the Federal and Provincial governments in response to International legally binding treaties in the Labour Convention case will be distinguished from that in response to the UNCED Conventions. In addition, there was no opportunity to raise the "Franklin Dam" decision from the High Court of Australia (High Court of Australia, Australian Law Reports 1983 PP 625-831). Constitutional law [Australian conservation case] which is particularly relevant to the discussion of the relevance of international law to the "inquiry" into the justification of granting the injunction. The Franklin Dam case deals with the following issues:

Protection of natural and cultural heritage — Prohibition of dam construction authorized by Tasmania Whether with Commonwealth power External affairs power. Whether mere existence of treaty enough Whether treaty "obligation" necessary Convention for Protection of the World Cultural and Natural Heritage (UNESCO).

The Franklin Dam case will be examined in the Appeal.

22. It should be noted as a preliminary comment that in the Hunter's submission to Judge Drake there was a reference to L.C. Green:

MR. HUNTER

And it may be of assistance to your lordship to have an excerpt from Elsie[L.C.] Green's work on International Law, Canadian Perspective, and I want to read a portion of what Professor Green has to say about treaty rights and I don't think there's any suggestion there that there has been a treaty but taking its at its extreme --

COURT: Well, there has to be some statutory recognition before the court.

MR. HUNTER: that is the point. And it starts at the bottom of 288 and goes to 289, but that is the simple point, there has to be statutory recognition and there has not been statutory recognition of anything that went on at Rio. I don't know what went on at Rio, ... and in the absence of legislation international matters are not of any relevance to this application. (Transcripts of submission from John Hunter, September, 15, 1993)

John Hunter mentioned Green and the page numbers 288-289 but did not actually cite from Green. The Judge had been subsequently given the aforementioned pages from Green by Hunter. The actual citation from Green was not in the transcripts. Green stated on pp. 288-289 that:

In Canada treaties are not self-executing and do not constitute part of the law of the land merely by virtue of their conclusion. Treaties require implementing legislation in order to change domestic law. (Canada v. (AG0 Labour Conventions Case. [1937] per Lord Atkin: "Within the British Empire there is a well-established rule that the making of a treaty is an executive act, while the performance of its obligations, if they entail alteration of the existing domestic law requires legislative action. [note this case will be examined further on pages...])

This assertion is, however, substantially altered by two significant further statements by Green:

Canada will not normally become a party to an international agreement which requires implementing legislation until the necessary legislation has been enacted [cite references, including 1982 document circulated by External Affairs "Canadian Reply to Questionnaire on Parliaments and the Treaty-making power"]

The full context of this statement comes from the 1982 "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power"; it is an External Affairs Department communique which was put together in 1982 to assist the External Affairs Officers in explaining the division of powers and constitutional conventions in Canada in relation to international obligations:

Many international agreements require legislation to make them effective in Canadian domestic law. The legislation may be either federal or provincial or a combination of both in fields of shared jurisdiction. Canada will not normally become a party to an international agreement which requires implementing legislation until the necessary legislation has been enacted.

In concluding this section which was referred to by John Hunter, Green, makes a very significant remark, which suggests that Canada is bound by the treaty prior to the enactment into national law:

the fact that a treaty has been signed and ratified but not yet enacted into national law does not preclude the international liability of the signatory under the treaty.

23. It will be submitted that John Hunter, lawyer for MacMillan Bloedel erred in stating that "nothing that happens in Rio affects the law of British Columbia until the province of British Columbia acting through its legislature determines that it shall affect the laws of British Columbia"(Hunter, Transcript, September 15 p. 22):

In my submission it would have been inappropriate to make such a point because that is not a relevant consideration and the reason it is not relevant consideration is that nothing that happens in Rio affects the law of British Columbia until the province of British Columbia acting through its legislature determines that it shall affect the laws of British Columbia. And it may be of assistance to your lordship to have an excerpt from L.C. Greens work on International Law, Canadian perspective [ note in this piece there was reference to the 1937 labour case (Attorney-General for Canada v Attorney-general for Ontario. Supreme Court of Canada A.C. 1937. [Labour Convention Case] pp. 326 -354 and to the External Affairs document "Canadian Reply to Questionnaire on Parliaments and the Treaty-making power"].

24. It will also be submitted that Mr. Justice Drake failed to consider the complexity inherent in the legal issues related to international obligations when he ruled " international agreements and resolutions, these not being expressed in Canadian law are not relevant" (Mr. Justice Drake, Transcript of Judgment, September 17, p. 3).

Mr. Justice Drake in his judgment made the following comment about international agreements and resolutions:

However, I will simply say, as far as their merits are concerned, that the argument relating to international agreements and resolutions, these not being expressed in Canadian law, are not relevant to this inquiry." (Mr. Justice Drake, Transcript of Judgment, September 17, p. 3).

Even though the order of Mr. Justice Hall will be expiring on August 31, 1994, it is important that this leave to appeal his order be granted so that the issues raised in the September 15 application to rescind this injunction could be fairly and judiciously considered and so that the September 17 judgment by Mr. Justice Drake could be reevaluated. If this order, and if the decision by Mr. Justice Drake is not challenged, they will be used in subsequent similar cases, as precedents. PART III - ARGUMENT

**A. In the hearing of August 26, 1993, there was a failure to bring to the attention of the Honourable Mr. Justice Hall that the granting of the injunction could contribute to non-compliance with international obligations of Canada and its Courts, and that, in the September 15, 1993 application to rescind the injunction, the Honourable Mr. Justice Drake erred in his assessment of the relevance of international law.**

25. It will be submitted that Canada, as a signatory, is bound to perform any treaty in good faith by ensuring the necessary conditions are in place for the performance of the treaty.

Under the Vienna Convention on the Law of Treaties, adopted in 1969; signed by Canada, acceded to by Canada on 1970, and in force 1980, Canada, as a signatory to this Convention has been obliged to ensure the performance of treaties in the following ways:

- (i) "to establish conditions under which justice and respect for obligations arising from treaties can be maintained" (Preamble)
- (ii) to demonstrate, through the process of ratification (accession) of a Treaty, that the State has "established on the international plane its consent to be bound by a treaty" (Article 2)
- (iii) to observe that "every treaty in force is binding upon the parties to it and must be performed by them in good faith. (Article 26)
- (iv) to interpret a treaty by agreeing that "A treaty shall be interpreted in good faith in accordance with the ordinary meaning to be given to the terms of the treaty in their context and in the light of its object and purpose. (Article 31)

Consequently, Canada, through acceding to and ratifying treaties has undertaken to perform treaties in good faith, has established on the international plane its consent to be bound, and to establish conditions for the maintaining of justice and respect for obligations under treaties.

26 This principle is reinforced throughout international customary law and extended to include the enacting of the legislation and laws necessary to ensure performance of treaty obligations.

The requirement to enact enabling legislation is evident in the International Covenant on Civil and Political Rights. International customary law places a duty on states to adopt such legislative, judicial or other measures as may be necessary to give effect to international treaties.

In the International Covenant on Civil and Political Rights—adopted 1976, signed and acceded to by Canada and in force in 1976, the principle of "duty-to-adopt-legislative ...measures" is enunciated;

Where not already provided for by existing legislative or other measures, each State Party to the present Covenant undertakes to take the necessary steps in accordance with its constitutional processes and with the provisions of the present Covenant, to adopt such legislative or other measures as may be necessary to give effect to the rights recognized in the present Covenant.

The principle is then further elaborated in the UN Resolution 37/7 World Charter of Nature (1982):

The principles set forth in the present Charter shall be reflected in the law and practice of each State, as well as at that international level (Article 14).

27. This principle is further entrenched in External Affairs policy in Canada by the constitutional convention of ensuring that necessary legislation is enacted before signing international treaties.

In an External Affairs document, "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power", which deals with Canada's responsibility related to international obligations, it is stated that Canada will "not normally become party to an international agreement until the necessary legislation has been enacted by the provinces."

In the "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power", the following references are made to international law and federal and provincial legislation:

If the existing laws of Canada (including Provincial and Federal Statutes, as well as the general rules of common law and the civil code of the Province of Quebec) do not confer upon the Government of Canada the capacity to discharge the obligations it proposes to undertake in a treaty, then it will be necessary for the appropriate legislative body, federal or provincial, to enact legislation to enable Canada to discharge its treaty obligations.

28. The "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power" appeared to ensure that the treaty would be performed either by enacting the necessary legislation prior to becoming a party:

Canada will not normally become a party to an international agreement which requires implementing legislation until the necessary legislation has been enacted or by passing implementing legislation:

The point we wish to make here is that in Canada implementing legislation is only necessary if the performance of treaty obligations cannot be done under existing law or thorough executive action.

In either case, it would appear that Canada has indicated in this document that the necessary legislation will be in place in order to perform the obligations under the treaty.

In an internationally legally binding document such as the Biodiversity Convention, and the Framework Convention on Climate Change, either the enabling legislation was in place prior to signing the treaties, or Canada is bound to enact legislation to enable Canada to perform its Treaty obligations in such a way as to ensure that it will not defeat the purpose of the treaty. This external affairs convention has to also be considered in conjunction with article 18 of the Vienna Convention on the Law of Treaties. Canada it would appear would not be able to defeat the purpose of the treaty from the moment of signing, and in order to comply with this provision Canada would have to ensure that the necessary legislation would be in place to prevent Canada from defeating the purpose.

29. In the appeal the following questions related to obligations will be examined;

- i. If Canada followed the usual constitutional convention as indicated in the above provision, Canada will not normally become a party until the necessary legislation has been enacted. Thus, we can assume from the federal point of view the Federal government believed that the necessary legislation to ensure that Canada would not defeat the purpose of the Convention on Biological Diversity and of the Climate Change Convention. If prior to the moment of signing these conventions in June 1992 if the Federal government was not certain that the necessary legislation was in place to prevent the defeating of the purpose of the Conventions, then implementing legislation would have to have been in place in June 1992.
- ii. In the appeal it will be contended that the Biodiversity Convention and the Climate Change Convention are relevant to the injunctions given by Canadian courts to lumber companies. Canada, by its own conventions is liable to comply, in its judicial, executive and legislative actions.

30. The principles of ensuring legislation enacted or implementing necessary legislation for performance of treaties are further placed in a provincial context when the matters in the treaty are usually deemed to be within provincial jurisdiction.

The 1982 "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power" further indicated in reference to the ratification and accession to treaties:

A multilateral treaty dealing with matters within provincial jurisdiction would be signed by Canada only after consultation with the provinces had indicated that they accepted the basic principle and objectives of the treaty. Assurances would be obtained from the provinces that they are in a position, under provincial laws and regulations, to carry out the treaty obligations dealing with matters falling within provincial competence, before action is taken by the Government of Canada to ratify or acceded to such a treaty.

Canada thus only proceeds to ratify a treaty when the provinces have been consulted and the provincial laws and regulations are in place to carry out the treaty obligations.

31. The Applicant, Joan Russow contends that all levels of Canadian governments, whether federal or provincial, and whether legislative, executive or judicial should endeavour in good faith to comply with the Biodiversity Convention, the Framework Convention on Climate Change, and the UN Convention for the Protection of Cultural and Natural Heritage. An injunction is judge-made law. Just as Canadian legislators must ensure that their statutes reflect their international treaty obligations, so must judicially made law, such as injunctions. Arguments must be aired in the Court as to this injunction's contravention of international treaty obligations. The proof readily exists that the Biodiversity Convention and the Framework Convention on Climate Change are violated by the activities of MacMillan Bloedel in Clayoquot Sound. The threat to biodiversity from clearcutting in Clayoquot Sound was clearly recognized and found as fact by the scientific panel appointed by the Harcourt government to review their logging plans for Clayoquot Sound. The panel also recognized that the standards of international law should serve as a minimum (First Report from the Clayoquot Sound Scientific Panel, March 1994).

No branch of government and no other law-making authority has a higher obligation than judges to apply the whole of the law and ensure that their own judge made injunctions are complying with the international obligations of Canada. This examination for compliance with international law was not conducted for the series of injunctions which have been granted to MacMillan and Bloedel in Clayoquot Sound.

32 If the provinces have followed the External Affairs convention then they would have assured the federal government that the necessary legislation either was or would be in place to ensure not only the fulfillment of obligations under the treaty but also the prevention of activities that could defeat the purpose of the treaty. If so, it can be presumed that the provinces will be equally responsible for fulfilling the obligations. The implications of this constitutional convention will be considered further in relation to the subsequent section dealing with the Labour Convention case which examines constitution provisions and treaties.

33. With internationally legally binding document such as the Biodiversity Convention or the Framework Convention on Climate Change it is necessary for the appropriate legislative body, federal or provincial, to enact legislation to enable Canada to discharge its treaty obligations, and in particular, from the moment of signing the Conventions in June 1992 so that nothing will defeat the purposes of the treaties.

34. It will be argued in appeal that in Canada the existence of a treaty obligation (under the legally binding Conventions on Biological Diversity and Climate Change) is sufficient to give rise to an "external affair." The legal issues to be addressed in this appeal have been eloquently addressed in a series of Commonwealth cases: including the cases from the High Court in Australia where the constitutional division of powers between the Commonwealth (Federal Government) and the State (Province) were examined, and the responsibility of the Commonwealth government to ensure compliance to the international obligations was recognized. The discussion

of these cases and the principles that have been used will follow; the discussion will be further extended in the Appeal if in the Leave to Appeal Application on August 23, 1994 the Chambers deems that the principles and decisions, given the similar federal structure of the Australian Constitution, from the High Court of Australia are applicable. The Labour Convention case from Canada was referred to by the dissenting judge in the following case: Commonwealth of Australia and Another v State of Tasmania and Others of (C6 of 1983) High Court of Australia, Australian Law Reports 1983 pp. 625-831 Constitutional law (Franklin Dam Case). Note that in the 1937 Labour Convention Case, the Federal government referred to the Australian Case.

It was held in the Commonwealth of Australia and Another v State of Tasmania and Others of (C6 of 1983) High Court of Australia, Australian Law Reports 1983 pp. 625-831 Constitutional law (Franklin Dam Case): Note that in the 1937 Labour Convention Case, the Federal government referred to the Australian case.

1. Existence of a treaty obligation (as there was under the Convention) was sufficient (though not necessary) to give rise to an external affair; there was no additional, independent requirement that the subject-matter of the treaty be of international concern.

Note: Article 34 UN Convention on the Preservation of Cultural and Natural Heritage the following provisions shall apply to those federal or non-unitary states

a) with regard to the provisions of this Convention, the implementation of which comes under the legal jurisdiction of the federal or central legislative power, the obligations of the federal or central government shall be the same as for those States Parties which are not federal states.

b) With regard to the provisions of this convention, the implementation of which comes under the legal jurisdiction of individual constitutional system

The following was also held in the Franklin Dam Case by Mason:

Article 34 of the convention, the Federal clause, does not relieve Australia from performance of its obligations under the convention. Para (a) of the article makes it clear that in the case of a central legislative power possessing legal jurisdiction to implement the provisions of the convention. the state party to the convention has an obligation to implement the provisions of the Convention.

35. The role of the courts to determine particular provisions was also addressed in the Franklin Dam case:

In *Airlines of NSW Pty Ltd v New South Wales (No. 2)* (1965) 113 CLR 54, Barwick CJ said (at 86) that "... where a law is to be justified under the external affairs power by reference to the existence of a treaty or convention, the limits of the exercise of the power will be set by the terms of that treaty or convention, that is to say, the Commonwealth will be limited to making laws to perform the obligations or to secure the benefits which the treaty imposes or confers on Australia. Whilst the choice of the legislative means by which the treaty or convention shall be implemented is for the legislative authority, it is for this court to determine whether particular provisions, when challenged, are appropriate and adapted to that end."

the same view was expressed by Starke, Evatt and McTiernan JJ in *Burgess* (at 658, 688) and Menzies J in *Airlines of NSW (No2)* at 141.

Parliament's power to legislate so as to give effect to a treaty conforms to the approach which this court has adopted in deciding whether legislative controls designed to achieve an end within power are themselves within power. (p696)

36. In the *Franklin Dam* case it was held that the country has the responsibility of giving effect to the principle of international customary law:

Whether failure on the part of Australia to enact domestic legislation incorporating the rules in the convention ... the Convention did not impose an obligation in specific terms to enact domestic legislation of a particular kind. It may be said that the legislation was valid because it gave effect to the principles of customary international law as declared by the Convention. But if Australia became a party to a convention which enacted a new set of rules in relation to the territorial sea and the contiguous zone, but that convention did not attract sufficient support to constitute its provisions as principles of customary international law. domestic legislation giving effect to it would none the less still constitute a valid exercise of the power. [citing *New South Wales v Commonwealth (the Seas and submerged Lands case)* (1975) 135 CLR 337; 8 ALR

37. In *Commonwealth of Australia and Another v State of Tasmania and Others* (C6 of 1983) High Court of Australia, Australian Law Reports 1983 pp 625-831 the Court decided that all domestic law must conform to the treaty:

The law must conform to the treaty and carry its provisions into effect. The fact that the power may extend to the subject matter of the treaty before it is made or adopted by Australia, because the subject matter has become a matter of international concern to Australia, does not mean that Parliament may depart from the provisions of the treaty after it has been entered into by Australia

and enact legislation which goes beyond the treaty or is inconsistent with it.

38. In the Franklin Dam case (1983), the principles established in the *Koaita v Bjelke-Petersen* (1982) 56 ALJR 625: 39 ALR 417 (Koowarta Case), were referred to in the deciding opinion. These principles, cited below in the Australian Commonwealth case, are particularly relevant to the external affairs power of the Federal Government in relation to Provincial Governments:

39. In the Koowarta case the following principle was upheld that becoming a party to a convention entails the undertaking of actions that would discharge obligations under the Convention:

In the *Koowarta v Bjelke-Petersen* (1982) 56 ALJR 625: 39 ALR 417, decided as to the scope of the external affairs power because the correctness of Koowarta was common ground between the parties. There the validity of ss 9 and 12 of the Racial Discrimination Act 1974 (CTH) was upheld as an exercise of the power conferred by s 51 (xxix) of the Constitution on the footing that the enactment of the two sections was a discharge of Australia's obligation under the International Convention on the Elimination of all Forms of Racial Discrimination. By becoming a party to that convention, Australia undertook to prohibit and eliminate racial discrimination in all its forms by appropriate means, including legislation. ...

Effect to an obligation imposed by international convention  
section gave effect to an obligation imposed by an international  
convention

40. In the Koowarta case the following principle was upheld that entering into a genuine treaty, the state assumes international obligations to enact domestic laws:

The Majority opinion was voiced by the following judges:

Stephen J. at 418.

There existed a quite precise treaty obligation on a subject of major importance in international relationships, which called for domestic implementation within Australia

Mason J. at 418

It would seem to follow inevitably from the plenary nature of the external affairs power that it would enable the parliament to legislate not only for the ratification of a treaty but also for its implementation by carrying out any obligation to enact a law that Australia assumed by the treaty

Brennan J. at 418

If Australia in the conduct of its relations with other nations accepted a treaty obligation with respect to an aspect of Australia's internal legal order, the subject of the obligation thereby because (if it was not previously) an external affair, and a law with respect to that subject was a law with respect to external affairs.

41. The Labour Convention case was used by the dissenting judges at 434 but was not considered to be a relevant precedent. Even one of the Judges, Wilson, who alluded to the case stated at p. 480 that "The decision in that case, though not the accuracy of the observation to which I have referred was subjected to a good deal of criticism." The Majority of the Judges in the Koowarta case followed the principles enunciated in the *R v Burgess: Ex parte Henry* (1936) 55 CLR 608.

42. In the Koowarta case the changed role of international agreements was examined.

Stephen at 452 identified the changed role as being "national governments' increased concern regarding domestic observance of internationally agreed norms of conduct":

"So long as treaties departed little from their early nature as compacts between princes, having no concern with domestic affairs, the conflict was muted: but in the century international conventions have come to assume a more extensive role. They prescribe standards of conduct for both governments and individuals having wide application domestically in areas of primarily regional concern, the very areas which, in federations, have tended to be entrusted to the legislative competence of the regional units of governments. This has necessarily exacerbated the problem which federations encounter in the implementation of international treaties while emphasizing the need for regional units in federations to recognize the legitimacy of national governments' increased concern regarding domestic observance of internationally agreed norms of conduct. "

Thus, areas of what are of purely domestic concern are steadily contracting and those of international concern are ever expanding (Stephen at 453).

post war growth in consensual international law (Stephen at 454)

What has occurred is rather a growth in the content of "external affairs." This growth reflects the new global concern for human rights and the international acknowledgment of the need for

universally recognized norms of conduct particularly in relation to the suppression of racial discrimination (Stephen at 454)

43. In the Koowarta case there was also the recognition of the importance and binding nature of international customary law:

Stephen at 456:

Even where Australia not a party to the Convention, this would not necessarily exclude the topic as a part of its external affairs. It was contended on behalf of the Commonwealth that, quite apart from the Convention, Australia has an international obligations to suppress all forms of racial discrimination because respect for human dignity and fundamental rights and thus the norm of non-discrimination on the grounds of race, is now part of customary international law, as both created and evidenced by state practices and as expounded by jurists and eminent publicists.

44. In the Koowarta case there was also the enunciation of the principle that if there exists a precise treaty obligation on a subject of major importance there should be domestic implementation.

Stephen at 456:

In the present cases it is not necessary to rely upon this aspect of the external affairs power since there exists a quite precise treaty obligation on a subject of major importance in international relationships, which calls for domestic implementation within Australia.

Mason at 459:

It would seem to follow inevitably from the plenary nature of the power that it would enable the parliament to legislate not only for the ratification of a treaty but also for its implementation by carrying out any obligation to enact a law that Australia assumed by the treaty.

45. In the Appeal the R v Burgess: Ex parte Henry case of 1936 will be examined and compared to the Canadian Labour Convention case of 1937.

Even though judges acknowledged that in Australian Law treaties were not self-executing, they acknowledged the power to the Commonwealth to enact implementing legislation:

Mason 459 recognize that it is a well settled principle of the common law that a treaty not terminating a state of war has no legal effect upon the rights and duties of Australian citizens and

is not incorporated into Australian law on its ratification by Australia (Chow Hung Ching v R (1948) .... not self-executing' ... to achieve this result, the provisions have to be enacted as part of our domestic law, whether by Commonwealth or State statute. Section 51 (xxix, arms the Commonwealth Parliament with a necessary power to bring this about. So much was unanimously decided by the court in R v Burgess: Ex parte Henry (1936) 55 CLR 608.

There the power enabled the Commonwealth Parliament to legislate so as to incorporate into their law the provisions of the Paris Convention for the regulation of aerial navigation.

46. The recognition of the disturbing outcome of the fragmentation of power in relation to international treaties was made in the R. v Burgess case:

Mason at 459 stated:

The consequence of the failure [ of the R. v Burgess: Ex parte Henry (1936)] would have been to leave the decision on whether Australia should comply with its international obligations in the hands of the individual States as well as the Commonwealth, for the commonwealth would then lack sufficient legislative power to fully implement the treaty. The ramifications of such a fragmentation of the decision-making process as it affects the assumption and implementation by Australia of its international obligations are altogether too disturbing to contemplate. Such a division of responsibility between the Commonwealth and each of the States would have been a certain recipe for indecision and confusion, seriously weakening Australia's stance and standing in international affairs. Fortunately, the approach in Burgess has since been confirmed by R v Poole; Ex parte Henry (no.2) 1939 61 CLR...

47. The appropriateness of ensuring that state responsibilities will be discharged. was recognized in the Koowarta Case:

Mason at 462. stated:

doubtless the framers of the Constitution did not foresee accurately the extent of the expansion in international and regional co-operation which has occurred since 1900. ...There is no reason at all for thinking that the legislative power conferred by s 51 (xxix) was intended to be less than appropriate and adequate to enable the Commonwealth to discharge Australia's responsibilities in international and regional affairs.

48. It will be contended in the appeal that as in Australia, Canada must be able to commit the whole of Canada to giving effect to obligations:

In the Koowarta case, Mason at 463 stated:

Increasing emphasis is given in the United Nations and in regional organizations to the pursuit by international treaties of idealistic and humanitarian goals. It is important that the Commonwealth should retain its full capacity through the external affairs power to represent Australia, to commit it to participation in these developments when appropriate and to give effect to obligations thereby undertaken. `

49. In the Koowarta case, Mason at 466 and 467 recognized that Australia in common with other nations is bound to enact domestic legislation to enable the implementation of treaties:

Broadly speaking the test which they favoured was whether in substance the legislation carries out or gives effect to the Convention. (At 466)

On the broad view which I take of the power it extends to the implementation of the International Convention on the on the Elimination of all forms of Racial Discrimination. It is an international treaty to which Australia is a party which binds Australia in common with other nations to enact domestic legislation in pursuit of the common objective of the elimination of all forms of racial discrimination.

But I would go further and say that even on the more cautious expression of the scope of the power by Dixon in Burgess, it would extend to the implementation of the convention.

50. In the Koowarta case, Mason at 468 affirmed the imposition of and obligation and the consequences of not performing the obligation:

At the level of international law, the means chosen to attain this end was the formulation of the Convention. It imposes on each of the many parties to it an obligation to eliminate racial discrimination in its territory. The failure of a party to fulfill its obligations becomes a matter of international discussion, disapproval, and perhaps action by way of enforcement.

51. In the Koowarta case Murphy at 471 discussed "the obligations to take legislative measure...

52. Murphy at 472 dissolved the distinction between internal and external affairs:

Preservation of the world's endangered species, maintenance of universal standards of human rights. are for Australia as well as other nations, internal as well as external affairs.

53. Murphy at 473 also affirmed the entitlement of the people to have legislation enacted that will fulfill obligations under a treaty:

the people of the States are entitled as well as obliged to have the legislative and executive conduct of those affairs which are part of Australia's external affairs carried out by the Parliament and executive Government of Australia.

54. A country could be in breach of an obligation imposed on it, if it failed to enact law. In the Franklin Dam in 1983, issues were raised related to external affairs power. In the appeal this issue will be discussed in relation to the Canadian/B.C / international legal obligations context:

55. In the Vienna Convention on the Law of Treaties which Canada adopted in 1969 there was the affirmation that, in addition to the duty to ensure that the necessary legislation has been enacted prior to signing a treaty, there is an obligation not to defeat the purpose of treaties.

Under Article 18 of the Vienna Convention on the Law of Treaties, Canada is obliged to not defeat purpose and object of international conventions from the moment of signing the treaty or convention.

Canada signed (June 5, 1992) and ratified (December, 1992) two legally binding Conventions: The Convention on Biological Diversity and the Framework Convention on Climate Change. Under Article 18 of the Vienna Convention on the Law of Treaties (1969), Canada is obliged to "not defeat the object and purpose of a treaty prior to the entry into force"; this provision in the Vienna Convention on the Law of Treaties would indicate that as of June 1992 Canada was bound not to defeat the purpose and object of both the Convention on Biological Diversity and the Framework Convention on Climate Change.

56. States are also bound not to create a situation which would make it impossible to fulfill the obligations under a treaty.

Canada is bound not to create a situation, such as the reduction and the loss of biodiversity in the coastal temperate rain forest ecosystems, the disappearance of significant carbon sinks, or the fragmentation of sites of outstanding universal value. All these situations would make it impossible to fulfill its obligations under the conventions.

#### Article 61

##### Supervening impossibility of performance

1. a party may invoke the impossibility of performing a treaty as a ground for terminating or withdrawing from it if the impossibility results from the permanent disappearance or destruction of an object indispensable for the execution of the treaty."
2. Impossibility of performance may not be invoked by a party as a ground for terminating, withdrawing from or suspending the

operation of a treaty if the impossibility is the result of a breach by that party either of an obligation under the treaty or of any other international obligation owed to any other party to the treaty.

Canada, by not ensuring that the necessary legislation and enforceable law were in place to prevent activities that could defeat the purpose of the Conventions, could permanently "destroy ... an object indispensable ..." such as the biodiversity in significant old growth stands or the carbon sinks of the old growth forest. The reduction and loss of biodiversity, as well as the elimination of carbon sinks of old growth forest could be contributing to a situation that would make it impossible for Canada to fulfill its obligations under the Conventions. By continuing with clear-cut logging and fragmenting currently unfragmented areas, Canada through B.C.'s practices of fragmenting old growth forests may be creating a situation where the object (the pristine old growth forest of outstanding universal value) could fail to fulfill the criteria for being identified as World Heritage Site under the UN Convention for the Protection of Cultural and Natural Heritage (1972).

57. In the appeal the acceptability of Canada's current policy of preserving 12% of the land as parks will be questioned.

Evidence will be submitted that internationally at meetings such as the IUCN Annual General Meeting, the representatives from Parks Canada, including the Assistant Deputy Minister, did not admit that the 12% solution was Canadian Policy.

When it was mentioned in a contact group meeting — a meeting to discuss resolutions, that if we commend B.C., in the resolution, for its current conservation proposals and for the CORE process, that we would be endorsing the "12 % solution." Biologist, Elliot Norse, laughed and stated "Surely no country is still linking conservation to percentages." The representatives from the Canadian government were not prepared to admit at that meeting that the "12 % solution" is Canadian and B.C. government policy.

Also, evidence will be submitted that will demonstrate that the current position of the IUCN on percentages and conservation, is that the linking should be avoided because it has no basis in biology or ecology, and that governments will use it as a minimum, and will justify preserving what has been referred to as "rock and ice" in lieu of significant ecosystems that are under demand from resources. (Comments made from the floor of the Annual General Meeting when a resolution linking percentages and conservation was being discussed.)

The reason that the position of the IUCN is significant is that the IUCN was the international organization that first linked the two in 1982, and continued to do this even up the Earth Summit. It has only been since the Earth Summit that the IUCN has recognized the way the percentage figures have been used. Groups like "Share B.C" have been using the linking of percentages to conservation to support the claim that "12% and no more." The notion of 12% can be used to legitimize the reduction of significant areas of biodiversity,

such as the Clayoquot, and thus contribute to the defeating of the purpose of the Biodiversity Convention.

58. In the appeal, the degree of consultation and the nature of the subject matter of the Attorney-General for Canada v Attorney-general for Ontario Supreme Court of Canada A.C. 1937. (Hereafter referred to as the Labour Convention Case) will be distinguished from the degree of consultation and the nature of the subject matter current matter to be dealt with in the appeal. This Labour Convention case has been purported to be the precedent to support the claim, by provinces, that they are not bound by international Conventions signed by Canada.

It would appear that the Labour Convention case turned on two legal points:

- (i) the fact that the provinces on the matter in that case were not consulted prior to Canada's undertaking obligations under international law; criteria were established for consultation.
- (ii) the designation of "labour" issues as not fulfilling the criteria for invoking Article 91 Constitutional powers

In the Biodiversity Convention and the Framework Convention on Climate Change both sets of criteria were adhered to in a way that would make the decision in the Labour Convention case no longer applicable.

59. It will be submitted that the degree of consultation surrounding the "International Labour Convention" — the subject matter in the Labour Convention case can be distinguished from the degree of consultation surrounding the Biodiversity and Climate Change Conventions and UNCED adopted documents. In the latter there is evidence that B.C. was consulted prior to both the signing and the ratifying of the Biodiversity and Climate Change Conventions, as well as prior to the adoption of Agenda 21.

In the "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power" there is reference to a constitutional convention to consult provinces prior to signing and ratifying Treaties and Conventions. It would appear that the Labour Convention case could be distinguished on the grounds that there was not consultation with the provinces during the negotiation process of the International Labour Convention. Unlike the Labour Convention, the negotiations surrounding the UNCED conventions, took place in Canada with the full consultation of the provinces. The provinces were fully consulted before the signing and ratifying of the Biodiversity and Climate Change Conventions. This commitment to consult is expressed as follows in the Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power", 1982:

The practice of the Canadian Government, in cases where the subject matter of an international agreement falls either wholly or partly within provincial jurisdiction is to consult each of the provincial governments. The process of

consultation is informal and is usually conducted by letters exchanged between the federal and provincial governments.

A multilateral treaty dealing with matters within provincial jurisdiction would be signed by Canada only after consultation with the provinces had indicated that they accepted the basic principle and objectives of the treaty. Assurances would be obtained from the provinces that they are in a position, under provincial laws and regulations, to carry out the treaty obligations dealing with matters falling within provincial competence, before action is taken by the Government of Canada to ratify or acceded to such a treaty. (Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power", 1982).

60. It should be noted that there appears to be a serious inconsistency within the "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power" document. On the one hand the document calls for consultation with the provinces prior to signing, along with the assurances that the necessary legislation has already been enacted, and yet the document still considers the applicability of the Labour Convention case which the "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power" claims has never been overturned.

In the "Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power" the following references were made to the Labour case:

The federal government is not entitled, merely because it has entered into a treaty, to legislate on matters that fall within the competence of the provinces. This is the effect of the Labour Conventions case. Attorney-General of Canada v. Attorney-General of Ontario (labour Conventions) (1937) A.C.

Although it has been argued that legislation to implement a treaty is within the federal power over the peace, order and good government of Canada, and that Section 132 should be interpreted in the light of changing circumstances, the Supreme Court of Canada has yet to rule on this question, which would involve a reconsideration of the reasoning in the Labour Conventions case. (Parliaments and the Treaty-making power —"Canadian Reply to Questionnaire on Parliaments and the Treaty-making Power")

61. In the Labour Convention case, criteria for being part of the decision-making process were proposed.

Several of the Counsels objected to the imposition of federal legislation to comply with international obligations because the provinces were not part of the decision. They cited the following aspects of being part of the decision: "cooperation", "obtaining advice", "obtaining consent" or "asking for approval":

- *Cooperation (at 327)*

...from her new international status Canada incurred obligations, they must, so far as legislation was concerned, when they dealt with Provincial classes of subjects, be dealt with by the totality of powers — by co-operation between the Dominion and the Provinces.

- *Obtaining advice* (at 340)

said that in treaties affecting subject-matters within the legislative competence of the Provincial Legislatures and bring into operation the provisions of s 132 of the BNA act the King should have his assent on the advice of his Provincial advisers as distinct from his dominion advisers.

- *Obtaining consent* (at 339)

The dominion has not brought the draft Conventions before the authority or authorities ' within whose competence the matter lies' and has not obtained the consent of those authorities as required by art 405., paras 5 and 7.

- *Asking for approval* (at 331)

It is ordinary constitutional practice to ask the approval of the body which will, in the event of the engagement being entered into, have the power to enact the legislation.

62. In the Appeal it will be shown that B.C., through consultations with the Federal Government at the ministerial level prior to the signing and the ratifying of the treaties, B.C. was consulted through the Federal governments engaging in "cooperation", "obtaining advice", "obtaining consent" or "asking for approval":

On August 8, 1994, the Strategic Planning Committee of the Council of Ministers of the Environment was contacted by Appellant and asked to forward a chronology of the Federal /Provincial Consultation process that occurred leading up to the Earth Summit and the signing of the UNCED Conventions (June, 1992), and leading up to the ratification of the UNCED Conventions (December, 1992).

63. It is expected that this chronology from their Strategic Planning Committee will have been made available in time to present it at the Leave to Appeal hearing. This evidence which will be submitted will demonstrate that in reference to the Biodiversity Convention and the Framework Convention on Climate Change, the provinces were consulted prior to the signing of the Convention (at numerous Ministerial meetings at the Prep Coms leading up to June, 1992) and prior to ratification (November 23, 1992 meeting prior to the ratification of the document in December of 1992).

64 It would appear that prior to signing and ratifying the Convention the Federal government consulted with the provinces and if the Federal government followed the External Affairs principle of ensuring that the necessary legislation was in place to enable performance of the treaty obligations under the Convention there had been opportunities during the consultation meetings to ensure that the necessary legislation was in place .

65. It would appear that B.C. played a significant role in the provincial endorsement of the UNCED Conventions by moving the endorsement at the November, 1992 Ministerial meeting, and by obtaining Cabinet support:

Jaime Alley, former representative for Corporate Affairs in the Ministry of the Environment said:

"That the provincial governments insisted on not being just another stakeholder in the consultation process but on having government to government consultation."

..."The province endorsed the ratification. We agreed with Canada to ratify it. There was provincial endorsement. The move to endorse the Conventions was made by John Cashore, the then B.C. Minister of Environment" Cashore then went to Cabinet, sought their support and endorsement of the ratification and then stated that the Cabinet had approved the Conventions to the CCME meeting.

"Barbara MacDougal, wrote to all provincial constitutional ministers seeking their advice prior to ratification" "There was continuous consultation you need to contact the CCME for details"

(Personal Communication, August, 1994)

66 In a document obtained through the Freedom of information Act there was evidence of the Provincial cabinet endorsement for the ratification of the Biodiversity and Climate Change Conventions:

**EXHIBIT:** E "UNCED follow-up: Endorsement of International Convention on Climate change and Biological diversity" November 4, 1992.

67. Through the "UNCED follow-up: Endorsement of International Convention on Climate change and Biological diversity" November 4, 1992, there has been the B.C. Provincial cabinet endorsement of the Biodiversity and Climate Change Conventions.

68. In the Appeal it will be contended that B.C. through a letter prior to August 1992, the then Constitutional Minister of B.C., the Hon Moe Sihota conveyed by letter to the Hon. Barbara McDougall, The Secretary for External Affairs, B.C.'s support for the Biodiversity and Climate Change Conventions.

On August 29 the Hon Barbara McDougall, Minister of State for External Affairs wrote to the Hon Moe Sihota Minister responsible for Constitutional Affairs to acknowledge B. C's support and to indicate that Canada plans to complete the ratification process by the end of 1992 (P. 05 of FAX of Exhibit E)

[The Appellant made an application (July 17, 1994) through the Freedom of Information Act for a copy of this correspondence.

69. In this Cabinet submission, dated November 4, 1992, the B.C. government affirmed that it was bound by the Biodiversity Convention and the Framework Convention on Climate Change:

Canada signed binding International Conventions on climate Change and Biodiversity  
.and indicated its support for ...a "Global Green Plan" for sustainable development, entitled Agenda 21.

70. In the event that the Appeal Court will not concur that the Labour Convention case can be distinguished on the basis of the argument that there was sufficient consultation prior to the signing and the ratification of the Convention on Biological Diversity and the Framework Convention on Climate Change, then a subsequent argument will be presented that the subject matter "Biodiversity " and "Climate Change" could come under the residuary powers of Section 91 of the Constitution. At the appeal, the Labour Convention case will also be distinguished on the ground that the decision in that case followed the Supreme Court case "In the Matter of Legislative Jurisdiction over Hours of Labour, [1925] Can. S.C. R. 505. where the Judge stated without discussion that "labour" issues" could come under the head of #13— "Property and civil Rights" or under # 16 "Local and Private Matters Within the Provinces." Thus, labour issues were not perceived to fulfill the categories outlined for justifying the invoking of residuary powers under Section 91. It will be submitted that the "International Labour Convention" — the subject matter in the Labour Convention case can be distinguished from the "Biodiversity," and "Climate Change." — the subject matter United Nations Convention on Environment and Development (UNCED).

71. In the Labour Convention case properties were set out for the designation of matters that could be deemed to come under residuary powers.

It would appear that "labour" issues' not warranting the invoking of residuary powers could be distinguished from "biodiversity" and "climate change issues because both the latter issues fulfilled most of the criteria or properties set down by the judges for determining inclusion in section 91. The subjects of "Biodiversity" and "Climate change" could be justifiably a subject that would not come under Section 92, and thus would fall to federal residuary powers. "Biodiversity" and "Climate Change" could be distinguished from labour on a number of grounds:

In the Labour Convention case Mr. Justice Atkin summarized the distinction between S 91 and S. 92 of the BNA act as follows:

section 91 under the general powers, sometimes called the residuary powers, given by s. 91 to the dominion parliament to make laws for the peace, order and good government of Canada in relation to all matters not coming within the classes of subjects by this act assigned exclusively to the legislatures of the provinces. p. 342 Atkin's judgment

In the Labour Convention case the criteria for determining whether the subject fell under section 92 were the following:

If the new functions affected the classes of subjects enumerated in s. 92 legislation to support the new functions was within the competence of the

provincial legislatures only. If they did not the competence of the Dominion Legislature was declared by s 91 and existed ab origin.

It was decided in this case that Labour relations would quite legitimately be placed under the subjects in section 92. "Property and civil rights in the province" which was assigned exclusively to the legislature of the provinces by head 13 of s92 of the BNA Act.

It was noted in the Labour case at 328 that there must be some grounds for taking the subjects out [of 13 of s 92). The Court was not satisfied that the federal government had established sufficiently the grounds for taking the subject of "labour issues" out of the subject area in section 92, as noted above in the 1925, Supreme Court case.

72. In the Labour Convention case, Counsels for the Attorney General of Canada and for the Attorney Generals for the provinces referred to a number of properties of a subject which would enable the subject to be designated as a new function and then come under the residuary powers of section 91. It was decided that "labour relations" did not fit into this category. In the appeal an attempt will be made to demonstrate that "biodiversity" and "Climate Change" are categories of subjects that could be deemed to invoke the residuary powers because these subjects would fulfill the properties advocated in the Labour Convention case, as well as in re: Regulation and Control of Radio Communication in Canada (Radio Case) (1932] A.C., p. 304 and in Re: The Regulation and Control of Aeronautics in Canada (Aeronautics Case) [1931] A.C. 1932, p. 54.

• *New subject:*

Counsel acting for the Attorney General of New Brunswick distinguished the Radio case on the ground that the subject matter in the radio case, in contrast to that of the Labour Convention Case, was a "new subject not embraced within the enumerated heads of s.92.(338.). It is quite likely that "biodiversity" and "climate change" would fall into this category. Biodiversity, and climate change are issues that transcend national, provincial and state boundaries are certainly new subjects that were not deemed to be limited to regional control.

73. It will be contended in the Appeal that Biodiversity and Climate Change because of the responsibility to not have activities under one jurisdiction impact on other jurisdiction would surely be considered to be activities that would come under "new subjects" and thus come under residuary powers of the federal government. If these two issues would be deemed as new subjects, then the federal government would be obliged to invoke its residuary powers and ensure that as of June 1992, no activities in Canada would defeat the purpose of these treaties. Consequently, federal government would be both entitled and bound to enact legislation that could override provincial legislation in the event that the provincial legislation would not be able to prevent the defeating of the purposes of the Conventions.

• *Matter of "such general importance"*

Further, the present legislation was not concerned with matters of such general importance as to justify the overriding of the normal distinction of powers in SS 91 and 92 (head note of Labour Convention case)

- *"Exceptional Circumstances"* Mr. Justice Atkin at 353

EXHIBIT F: AFFIDAVIT: Affirmation of the urgency of the global situation

EXHIBIT F\* Exhibit submitted in the September 15 Application and presented in transcripts

Statements from Royal Society, Science Council, presented before Mr. Justice Drake.

74. From the B.C. government's own "State of the Environment Reporting" document, 1993, the "importance" and "exceptional conditions" of biodiversity are stressed:

Biodiversity is the variety of life on the planet. It is important for a number of reasons. First, we have an ethical stewardship responsibility for other living things with which we share the planet. Second, high species diversity contributes to ecosystem stability. Third, biodiversity has immeasurable aesthetic value; provides food medicine and other products of enormous economic value; and generates critical ecosystem services essential to all life:

"

*Standard of necessity*" Mr. Justice Atkin at 353

75. From the B.C. government's own "State of the Environment Reporting" document the essence and necessity of Biodiversity is affirmed because of its links to other cycles

Biodiversity is essential to maintain ecosystem processes that support all life. these include; Maintaining the gaseous compositions of the atmosphere, climate control, regulating the hydrological cycle, generating and maintaining soils, cycling nutrients necessary for the growth of living things, and decomposing waste materials.

76 From the B.C. government's own "State of the Environment Reporting" document the B.C. government also recognized the importance of identifying species and its inability to assess the current state in B.C:

Genetic diversity enables species to adapt to changes in their environment over time. It is difficult and costly to measure genetic diversity and therefore difficult to assess its current state in B.C.

77. From the B.C. government's own "State of the Environment Reporting" document the importance of the biodiversity of coastal temperate rainforests is acknowledged

Trees in coastal temperate rain forests grow to very large sizes and exceptionally old ages. Such ecosystems have the highest standing biomass of any ecosystem on earth and provide for tremendous biodiversity. Coastal temperate rain forest occurs in a few scattered spots around the world, and are considered rare on a global scale. North America has the largest continuous tract of coastal temperate rain forest on earth, approximately half of which is in B.C.

- *Matters of national importance* at 335

Matters of national importance of such wide import as to affect the body politic of the dominion in the overriding way that was found in *Russell v the Queen.*, if they were taken out of the specific heads of s. 92, then Ontario is satisfied to see this legislation supported. (At 335 Labour Convention case)

In the press release issued at the time of ratifying the Biodiversity Convention. Prime Minister Brian Mulroney indicated Canada's commitment:

to [fulfill] Canada's commitment to ratify the Convention before the end of 1992. Canada is the first industrialized country to ratify both agreements. The Convention which emerged from last June's Earth Summit in Brazil, exemplify a global commitment to the principles of sustainable development ...as embodied in Agenda 21 and agreed to at the Earth Summit. the Convention on Biological Diversity provides a framework for conserving the planet's animal and plant life and maintaining their habitats.

#### WHAT IS CANADA'S POSITION ON THE BIODIVERSITY CONVENTION?

Canada supports the international effort to conserve biodiversity. Canadian representatives participated fully in negotiations of the Convention and the federal provincial and territorial governments all believe that the Convention is a good basis for tackling this international problem.

• *Extraordinary peril to the National life of Canada*" Mr. Justice Atkin at 353 The federal government in its background to this press release at the time of ratification of the Biodiversity Convention on December 4, 1992, also affirmed without Biodiversity, "humanity's ability to survive is threatened."

What is biodiversity: Biodiversity provides the very foundation for human life and life support systems. without healthy and stable biological resources, humanity's ability to survive is threatened.  
(Press Release on Ratification of the Biodiversity Convention, Dec. 4, 1992)

• Canada is continuing to play an active international role in discussion about the Convention. It has been actively involved in preparing for the implementation of the Convention, by participating in all the UN meeting on biodiversity since the Earth Summit.

• the federal, provincial and territorial government in Canada are proud of Canada's leadership on the issue of biodiversity conservation. As one of the first countries to sign the Convention and the first industrialized country to ratify it, Canada has demonstrated its commitment and leadership to the world. we must of course, continue to ensure that our performance at home lives up [to] that commitment

From these statements both by the provincial government and by the federal government, it would appear that "biodiversity" is of "general importance."

- *Not foreseen matters*

Robertson, KC indicated p.340 (arguing the federal position]

One of the things upon which the parties were able to agree at confederation in respect of matters not provided for not foreseen, was that they were to go to the Dominion. One of the outstanding dangers at the time of confederation and to-day, is that of sectional interests and prejudices and private interests interfering with the good government of Canada as a whole. Reliance is placed on the residuary powers as conferring the performance of treaty obligations: ... Radio case (1932] A.C. 304, 311, 313.

Residual powers for environmental issues which are all pervasive, similar argument could be for climate change. The principle that could apply is the consequences cannot be controlled by a particular jurisdiction within Canada let alone even within Canada. The impact of anthropogenic actions on biodiversity and climate change are not "restrict able" to traditional jurisdictional boundaries. Presumably the largest unit of jurisdictional power should be in control of the fulfillment of obligations under the Convention.

- *Importance which outweighs the civil right of the individual*

Robertson K.C. supporting the federal position indicated:

When a matter has attained an importance which outweighs the civil right of the individual, once it has reached that stage, then the civil right is lost sight of and the matter from an international aspect outshines it, and is the one to which attention should be directed. Here an international obligation has arisen and it is the duty of Canada to see that obligations are performed Canada alone can perform it and Canada, therefore, in these particular circumstances and while the obligation endures, is the body to legislate because it is an international obligation. Is not the proper view that once Canada has properly created international obligations then it is necessary for the peace, order and good government of the Dominion that Canada should perform it? p. 341

Note: the reference to the aeronautics case were not in the original submission. They were, however, referred to in the oral submission. The following references and a subsequent page of documentation was written into the leave to the appellant's appeal book but not fully referred in the court submission

Note: Applicability of Aeronautics case at 71, AC 1931  
cites propositions from Attorney General of Can. V Attorney General of B.C.  
AC 1930

1. the legislation of the parliament of the dominion, so long as it strictly relates to subjects of legislation expressly enumerated in s91, is of paramount authority

at 71

2. the general power of legislation conferred upon the subjects expressly enumerated must be strictly confined to such matters as are unquestionably of national interest and importance. And must not trench on any of the subjects enumerated in s92, as within the scope of provincial legislation,

unless these matters have attained such dimensions as to affect the body politic of the dominion.

4. there can be a domain in which Provincial and Dominion legislation may overlap, in which case neither legislation will be ultra-vires, if the field is clear, but if the field is not clear and the two legislations meet the dominion legislation must prevail

at 73

it is obvious therefore that there may be cases of emergency where the dominion is empowered to act as a whole" also by reason of the plain terms of s132

78. In the Appeal the relevance of Section 132 of the B.N.A. Act will be reconsidered in the light of the fact that it is the only section that does refer explicitly to obligations under treaties.

The Parliament and government of Canada shall have all powers necessary or proper for performing the obligations of Canada or of any Province thereof, as part of the British Empire, towards foreign countries arising under treaties between the Empire and such foreign countries. (Section 132, B.N.A.)

In the "Aeronautics case" s. 132 was still deemed to be relevant.

At 73, Mr. Justice Swank held that

by reason of the plain terms of s 132, where Canada as a whole having undertaken an obligation is given the power necessary and proper for performing that obligation

at 7070 also held:

The underlying objective of the BNA Act was to establish a system... the real object of the Act was to give the central Government those functions and almost sovereign powers by which uniformity of legislation might be secured on all questions which were of common concern to all provinces as members of a constituent whole

at 73 he stated

there may be cases where the dominion is entitled to speak for the whole...by reason of plain terms of S.132 where Canada as a whole having undertaken an obligation is given the power necessary and proper for performing that obligation.

In the 1992, United Nations Convention on Environment and Development (UNCED) Action plan, Agenda 21, in the Biodiversity Chapter 15, — a positive duty is assumed by governments adopting Agenda 21:

" At the same time, it is particularly important in this context to stress that states have the sovereign right to exploit their own biological resources pursuant to their environmental policies, as well as the responsibility to conserve their biodiversity and use their biological resource sustainably, and

to ensure that activities within their jurisdiction or control do not cause damage to the biological diversity of other States or of areas beyond the limits of national jurisdiction. " (15.3. Agenda 21).

It would appear that it would be possible in the light of "changing circumstances" that a Convention such as the Biodiversity Convention which deals with a phenomenon that does not respect proprietary divisions; that subject areas such as biodiversity and climate change would come under federal purview. In this context it could be argued that biodiversity because of the responsibility to not have activities under jurisdiction impact on other jurisdiction that biodiversity would come under section 132 which bestows upon the federal government overriding powers, in the light of changing circumstances — which in this case would be the pervasiveness of biodiversity. In 1867, no one was thinking of incurring environmental obligations.

79. At the Appeal, evidence will be presented to indicate the assessment of Canada's responsibility to other states for B.C.'s practices:

At the IUCN (World Heritage Union) 1994 Annual General meeting of the IUCN Commission on Environmental Law, the question of Federalism and International Law was raised. In particular, the Appellant raised the question about the responsibility under a treaty of the federal state when there is non-compliance within the sub-unit. As a specific example, Canada's responsibility for B.C.'s actions was raised. Several of the lawyers, some of whom had served as advisers to the International Court of Law or to the United Nations, concurred that Canada could be held responsible under the Conventions to other countries, if through B.C.'s actions Canada was in non-compliance with international legal obligations under the two Conventions signed at UNCED.

80. In the Appeal it will be noted that under the Convention of Law of Treaties, Canada has been obliged not to invoke internal law to justify failure to perform international obligations.

Under Article 27 of the Vienna Convention on the Law of Treaties, Canada is bound to not invoke Internal law to justify failure to perform a treaty:

A party may not invoke the provisions of its internal law as justification for its failure to perform a treaty.

Neither the internal law of the B.C. Government's land use decision regarding Clayoquot Sound, nor the internal law of judicial injunctions justifies failure to meet the provisions within the Conventions.

81. In the Appeal, it will be argued that as a result of MacMillan Bloedel's applying for an injunction and the Court's granting this injunction, the Courts have permitted the continuation of practices that are in violation of the Biodiversity and Climate Change Conventions. The Courts have inadvertently encouraged non-compliance with international law.

In addition, Canada, if not having notified otherwise, is bound by what occurs in B.C.

Under Article 29 of the Convention of Law of Treaties, "territorial scope of treaties", Canada is bound throughout its territory including all provinces and territories:

Unless a different intention appears for the treaty or is otherwise established, a treaty is binding upon each party in respect of its entire territory.

If Canada has expressed a different intention, then it is important that the other states of the world know that when Canada signs an international agreement in areas over which provinces have jurisdiction, the provinces are not bound. Citizens from countries that have endorsed the self-executing principle related to international law presume that if Canada signs and ratifies a treaty that the treaty obligations are binding on all the parts of the country including provinces and territories

**EXHIBIT:** G Affidavit from a citizen from the US — a country that has endorsed the self-executing principle.

82. It will be contended that Canada has been in non-compliance since June 1992 (UNCED) because B.C. forest practices have been in contravention of provisions in the Conventions, and Canada has thus defeated the purposes of the Conventions.

83. It will be submitted in the Appeal that it can be demonstrated not only that Canada through the practices of B.C. has been defeating the purpose of the Conventions signed in June, 1992 at UNCED, but also that Canada has been defeating the purpose of another Convention that is particularly relevant to Clayoquot and the injunction granted to MacMillan Bloedel: the UN Convention for the Protection of Cultural and Natural Heritage (1972).

The UN Convention for the Protection of Cultural and Natural Heritage was signed in 1972. Canada has been obligated to identify and nominate sites as being sites of "outstanding universal value." Canada and B.C. have been remiss in not identifying and nominating an extensive network of ancient coastal temperate rainforests, including Clayoquot Sound as being a natural heritage of "outstanding universal value."

84. From the B.C. government's own "State of the Environment Reporting" document the importance of the biodiversity of coastal temperate rainforests is acknowledged:

Trees in coastal temperate rain forests grow to very large sizes and exceptionally old ages. Such ecosystems have the highest standing biomass of any ecosystem on earth and provide for tremendous biodiversity. Coastal temperate rain forests occur in a few scattered spots around the world, and are considered rare on a global scale. North America has the largest continuous tract of coastal temperate rain forest on earth, approximately half of which is in B.C.

85. Canada has failed to comply with the Biodiversity Convention and the Climate Change Convention because B.C. since the moment of signing the Biodiversity and Climate Change Conventions has continued to log in an ecologically unsound way, such as clearcutting primary growth coastal temperate rain forests.

86. Canada has contravened the Convention because, B.C. since June 1992 has defeated the purpose of Biodiversity Convention by having failed to identify biodiversity

Under the Convention the parties are required "to identify biodiversity"

At the ratification of the Biodiversity Convention in the December 4, 1992, speech by Prime Minister Mulroney, he informed the public of about the state of identification of species in Canada and admitted that there were an equally large number not reported:

Canada is one of the largest countries in the world and is home to about 70,000 known species and many different habitats. However, many of Canada's ecosystems are threatened.

Biodiversity the web of life (environment Canada publication)

A total of just over 70,000 species of animals, plants and micro-organisms have been described or reported to occur in Canada. The same number remain undescribed or unreported by science. If viruses are added, the total is doubled to 290,000

Canada may claim to be complying with the Biodiversity Convention by indicating that they are developing a "Canadian Biodiversity Strategy" (see draft document June, 1994); however, even by its own admission:

the Status of Biodiversity is also not fully understood. As many as half of the estimated 140,000 species in Canada have not yet been identified.... and that only vertebrates and vascular plants are being evaluated.... . The status of most of Canada's species such as fungi, bacteria and invertebrates -- all of which play crucial roles in ecosystem function — is not fully known. ....

Yet Canada, through ecologically unsound practices in B.C. continue to log primary forest ecosystems that contain the biodiversity that will be lost before it is identified.

87 From the B.C. government's own "State of the Environment Reporting" document the B.C. government also recognized the importance of identifying species and its inability to assess the current state in B.C:

Genetic diversity enables species to adapt to changes in their environment over time. It is difficult and costly to measure genetic diversity and therefore difficult to assess its current state in B.C.

British Columbia had not sufficiently identified biodiversity at the time of signing the Convention, and British Columbia has continued to permit practices that contribute to the loss of biodiversity. In the event of the government's own admission that it is

virtually impossible to identify species; it should not defeat the purpose of the Biodiversity Convention by ensuring that the storehouses of biodiversity not be logged.

88. Canada since June 1992 has defeated the purpose of Biodiversity Convention through B.C.'s having failed to carry out an environmental assessment review of anything that could contribute to a reduction or loss of biodiversity,

The former Canadian Ambassador for the Environment to the United Nations, Arthur Campeau, who was the head of the Canadian Delegation at UNCED concurred that Canada had been in non-compliance with the Convention because of Canada's failure to carry out an environmental assessment review of anything that could contribute to a reduction or loss of biodiversity [such as clear-cut logging and other ecologically unsound practices]. (Personal communication, March 1994)

In jurisdictions where an environmental impact assessment has been carried out, practices, typical of those carried out currently in BC forests, have been assessed as being destructive of biodiversity. For example, a German biologist, Dr. Schutt, specializing in biodiversity indicated the following about "clearcutting":

The practice of clearcutting, followed by artificial reforestation has undoubtedly many technical and organizational advantages. In the course of time, however, soil scientists and ecologists found out that the practice of clearcutting automatically leads to considerable drawbacks:

- wounding of the soil surface through logging operations.
- Risk of erosion -High irradiation and higher climatic extremes alter the microclimate, the flora and the microflora and deteriorate the growing conditions for a number of valuable tree species. -
- Soil compression and a reduction of species richness
- An accelerated decomposition of organic matter occurs, combined with a wash out of nutrients, and the eutrophication of ground water, rivers and lakes occur (Dr. Schutt, Biological Department, University of Munich, Environmental Ethics Conference, 1992, Vancouver)

89. Canada since June 1992 has defeated the purpose of Biodiversity Convention through B.C. government's and its courts' having failed to avoid or minimize the threat of significant reduction or loss of biological diversity through their not invoking the precautionary principle which reads as follows:

..where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat (Convention on Biological Diversity)

As of June 1992, Canada undertook the obligation under the Biodiversity Convention to invoke the precautionary principle.

At the ratification of the Biodiversity Convention in the December 4, 1992, speech by Prime Minister Mulroney indicated his awareness of the loss of biodiversity and in particular the impact of modern forestry practices:

Biodiversity is being threatened directly and indirectly by human activity such as

(i) Destruction of wildlife habitat

the conversion of natural areas, on land and at sea, to other uses destroys disrupt animal and plant habitat. Such loss of habitat leads directly to the loss of species. ...

(ii) Over-exploitation of animal and plant species

(iii) Disturbances of natural ecosystems

Each of the world' ecosystems consists of a community of animals, plants and micro-organisms and the sunlight, water, soil and minerals they need to survive. These ecosystems exist in a delicate balance, with each piece of the puzzle playing a specialized role. Any disruption of the balance can cause a ripple effect of disruptions, threatening the entire ecosystem and individual parts of it...

(1v) Modern agricultural and forestry practices

...similarly, modern forestry often replants a single high-yielding tree species after logging a diverse forest ecosystem

Any human activity that has a negative effect on the environment has a negative effect on biodiversity.

Undoubtedly the "modern forestry practices" he was referring to were the silviculture regimes of clearcutting and replanting.

90. It will be brought to the attention of the judges in the Appeal that experts throughout the world recognize that the practice of clear-cut logging destroys biodiversity, and that if Canada were to invoke the precautionary principle, clear-cut logging and other ecologically unsound selective logging practices would be discontinued.

There is sufficient evidence that clear-cut logging destroys biodiversity as defined under the convention. Dr. Richard Mittermeier, President of Conservation International, has correctly, stated that the precautionary principle, if invoked, would justify the banning of clear-cut logging (Personal Communication, IUCN Annual General Meeting, 1994)

91. Canada, since June 1992, is in non-compliance with the Framework Convention on Climate Change through B.C.'s failure to conserve carbon sinks, and through B.C.'s destruction of sinks, Canada has defeated the purpose of the Convention.

B.C. since June 1992 has defeated the purpose of Climate Change Convention by having failed to protect carbon sinks; it has continued to permit the harvesting in significant carbon sinks like primary coastal temperate rainforest such as those of Clayoquot Sound.

Under the Framework Convention on Climate Change Canada is required to protect and enhance Greenhouse gas sinks and reservoirs:

Each of these Parties shall adopt national policies and take corresponding measures on the mitigation of climate change, by

limiting its anthropogenic emissions of greenhouse gases and protecting and enhancing its greenhouse gas sinks and reservoirs.

92. Canada, through B.C. 's not fulfilling its duty to identify, protect and conserve natural heritage of outstanding universal value, such as Coastal temperate rainforest areas like Clayoquot Sound, has since 1972 , when it signed the UN Convention for the Protection of Cultural and Natural Heritage, failed to discharge its obligation to protect the natural heritage of outstanding universal value for future generations under the United Nations Convention for the Protection of Cultural and Natural Heritage:

Each State Party to this Convention recognizes that the duty of ensuring the identification, protection, conservation, presentation and transmission to future generations of the cultural and natural heritage referred to in articles 1 and 2 and situated on its territory, belongs primarily to that State. (United Nations Convention for the Protection of Cultural and Natural Heritage, 1972)

In the UN Conference on Humans and Environment of 1972, the requirement to preserve our environmental heritage and the requirement to save a representative sample of natural ecosystems for future generations were being recognized:

The natural resources of the earth including the air, water, land, flora and fauna and especially representative samples of natural ecosystems must be safeguarded for the benefit of present and future generations (Principle 2)

Man has a special responsibility to safeguard and wisely manage the heritage of wild life and its habitat which are now gravely imperiled by a combination of adverse factors (Principle 4),

This international obligation was reaffirmed in the UN Resolution 37/7 (1982):

Reaffirming that man must acquire the knowledge to maintain and enhance his ability to use natural resources in a manner which ensures the preservation of the species and ecosystems for the benefit of present and future generations, (UN Resolution 37/7, 1982)

In 1988 the trend gravity of the situation for "generations to come" was recognized by the Science Council of Canada

## THE ECOLOGICAL CRISIS

The continuing and accelerating deterioration of the planet's ecological base poses a significant threat to the long-term viability of our world. Evidence concerning global warming,

ozone depletion, species depletion and elimination, the spread of the deserts, forest destruction, soil degradation, acidified lakes, rivers and streams, and groundwater pollution exists in abundance in the scientific literature. (1988, Science council of Canada)

Much of the evidence is subject to many qualifications and even scientific debate, but the overall trend and its gravity for our planet, to its multitude of species and to the generations to come, are beyond question. (11)

This Commitment to future generations was restated in the Caracas Declaration in February 1992:

To support the development of national protected area policies which are sensitive to customs and traditions, safeguard the interest of indigenous people, take full account of the roles and interests of both men and women, and respect the interests of children of this and future generations (Caracas Declaration in February 1992, p.3)

It will be noted that throughout the UNCED documents there was expressed the responsibility to future generations.

The principle of considering the need to preserve ecological heritage for future generations, because of its continued inclusion in international documents has become a principle of international customary law.

Not only has Canada been remiss in not ensuring compliance to this principle of international customary law, but also since June 1992, Canada is in non-compliance with both the Biodiversity Convention and the Climate Change Convention for failing to conserve and sustainably use biological diversity for future generations. Under the Biodiversity Convention, Canada has indicated its determination to do the following:

"To conserve and sustainably use biological diversity for the benefit of present and future generations (Biodiversity Convention, UNCED, 1992)

In the appeal there will be an affidavit indicating the impact on the youth of governments undertaking obligations and not fulfilling them

**EXHIBIT:** H Affidavit by Christopher Scott along with affidavits from representatives of future generations

In the appeal there will be an affidavit indicating the impact on the youth of governments undertaking obligations and not fulfilling them

**EXHIBIT: I Affidavit by Susan Gage**

Since 1972 Canada has been remiss in not fulfilling its duty under the UN Convention for the Protection of Cultural and Natural Heritage (1972)

In 1972, through this Convention, Canada, along with the other states that are parties to this Convention, recognized the urgent need to address the disappearance of natural heritage and acknowledged the global responsibility to preserve natural heritage:

Considering that parts of the cultural or natural heritage are of outstanding interest and therefore need to be preserved as part of the world heritage of [humankind] as a whole (Convention for the Protection of the World cultural and Natural Heritage, preamble, 1972).

Considering that in view of the magnitude and gravity of the new dangers threatening them, it is incumbent on the international community as a whole to participate in the protection of the cultural and natural heritage of outstanding universal value... (Convention for the Protection of the World cultural and Natural Heritage, preamble, 1972)

Under Article 4 of this Convention, Canada undertook a positive duty of ensuring the identification of natural heritage:

Each State Party to this Convention recognizes that the duty of ensuring the identification, protection, conservation, presentation and transmission to future generations of the cultural and natural heritage referred to in articles 1 and 2 and situated on its territory, belongs primarily to that State. It will do all it can to this end, to the utmost of its own resources and where appropriate with any international assistance and co-operation ...

and under article 5 d the appropriate legal measures must be taken to ensure identification:

- To take the appropriate legal, scientific, technical, administrative and financial measures necessary for the identification, protection, conservation, presentation and rehabilitation of this heritage. (Article 5d)

Canada, and B.C. have failed to fulfill their duties by not identifying a network of coastal temperate rainforests, including Clayoquot Sound, and nominating this network as a World Heritage Site. In 1981, Australia, nominated a large area of its temperate rainforest, and in 1993 nominated an additional network of temperate rain forests. With the continued fragmentation of the forests in B.C. If we do not act immediately, it will be too late to nominate a network of temperate rainforests and conservation corridors because the forested areas in B.C. will no longer be able to fulfill the criteria for being designated as a World Heritage site.

94. In the Appeal the Franklin Dam case will be examined in relation to the UN Convention for the Protection of Cultural and Natural Heritage

In the Franklin Dam case, the area under dispute — a network of temperate old growth forest had already been proposed in 1981 by the state and confederation governments as a World Heritage Site. The network was inspected by the IUCN, the World Conservation Union, which is the body responsible for determining if a proposed site fulfills the criteria for protection as a World Heritage Site.

Although Clayoquot Sound has not yet been nominated by B.C and Canada as a World Heritage site, it was part of a proposal contained in a resolution passed at the 1994, Annual General Meeting of the IUCN. The proposed network was deemed to fulfill the criteria for nomination, even though B.C. and Canada have not undertaken to nominate a network of old growth temperate rainforest as a World Heritage Site.

A network of temperate rainforests including Clayoquot Sound would fulfill the criteria for nomination as a World Heritage Site.

95. A network of old growth temperate rainforests, including Clayoquot Sound would fulfill the following criteria for inclusion in the World Heritage list:

(ii) be outstanding examples representing significant ongoing geological processes... biological evolution and man [human] interaction with his [its] natural environment; as distinct from the periods of the Earth's development, this focuses upon ongoing processes in the development of communities of plants and animals, landforms and marine areas and fresh water bodies;

(iii) contain superlative natural phenomena formations or features for ... outstanding examples of the most important ecosystems, areas of exceptional natural beauty or exceptional combinations of natural and cultural elements;

(iv) containing the most important and significant natural habitats where threatened species of animals or plants of outstanding universal value form the point of view of science or conservation still survive

96. The IUCN (the World Conservation Union) the organization that has been given the responsibility under the UN Convention for the Protection of Cultural and Natural Heritage, passed a resolution at the January 1994 Annual General Meeting; This resolution

called upon B.C. to preserve and nominate a network of temperate coastal rainforests taking into consideration the proposals by the Western Canada Wilderness Committee (whose proposal included Clayoquot Sound).

97. A resolution on North American Coastal Temperate Forests ("19.72REV2 North American Coastal Temperate Forests") was passed by the IUCN General Assembly meeting at Buenos Aires, Tuesday, January 25, 1994. The IUCN is an international organization of state, professional and non-governmental representation from over 125 countries. In order to pass

the resolution has to pass the two houses: the state house composed of state representation from 125 countries and the NGO house with representation from the same countries. This resolution was passed with only one country abstaining, Canada.

This resolution recognized the uniqueness of the area:

UNDERSTANDING that many endemic and unusual plants and animals occur only in these forests; and that in biomass productivity, the old growth forests (ancient forests) of this biome are unequaled anywhere;

This resolution also acknowledged that on Vancouver Island Forest practices have been the cause of the disappearance of these forests:

MINDFUL of the fact that such ancient forests on Vancouver Island and on the mid-coast of British Columbia are disappearing at a rapid rate as a result of practices that have, to date, not been ecologically sustainable;

This Resolution also called upon the governments of Canada and B.C. to consult with groups like the Western Canada Wilderness Committee (WCWC) about networks of protected areas. The network proposed by WCWC does include Clayoquot Sound.

UNDERSTANDING that the Raincoast Conservation Society, the Sierra Club, and the Western Canada Wilderness Committee have proposed a large network of protected areas, including conservation corridors, in areas of such ancient forests on Vancouver Island and the midcoast of British Columbia;

IUCN

2. CALLS UPON the Governments of Canada and British Columbia to substantially expand the amount of land in networks of protected areas, with conservation corridors, on Vancouver Island and the midcoast of British Columbia, taking into consideration the recommendations of environmental groups active in the regions such as the Raincoast Conservation Society, the Sierra Club and the Western Canada Wilderness Committee;

**EXHIBIT: J 19.72REV2 North American Coastal Temperate Forests**

98. In the Appeal it will be pointed out that the Western Canada Wilderness Committee proposal for a network does include Clayoquot Sound.

**EXHIBIT: K** Information to be submitted by the Western Canada Wilderness Committee. Copy of vision of Vancouver Island.

99. This appeal will also refer, as was done in the original September 15 submission to Mr. Justice Drake, to the Common Law Doctrine of Legitimate Expectations. If this doctrine were applied it could be argued that citizens of Canada have a legitimate expectation that Canada will fulfill its international legal obligations.

100. Citizens of B.C. have the right to expect that B.C. as part of Canada will fulfill international obligations undertaken by Canada after consultation with B.C.:

In Re: Canada Assistance plan (Canada) 1991 (2SCR at 525), the B.C. government recognized the importance of using the Doctrine of Legitimate Expectation in a dispute with the Federal Government. Even though at the Supreme Court of Canada, the B.C. argument was dismissed, the case supports the contention that the Government of British Columbia, including the Attorney General's office endorsed the doctrine.

"Canada has continually conveyed its professed concern for the environment in a way that should entitled Canadians to expect actions that reflect this concern. For example, in the preface of Canada's National Report, which was submitted to the Earth Summit in Rio, the Canadian government gave the impression that Canadians were "stewards" observing their "environmental responsibility":

as stewards of a vast and beautiful land, and as a people intimately connected to the environment, Canadians are aware of their environmental responsibilities." (Canada's National Report, Preface)

And further in the section on the "quality of life", the Canadian government stated

"As a small population with a large land mass, Canadians have access to relatively unspoiled wilderness areas rich in wildlife ... Canada has an international reputation as a beautiful, safe and mostly unspoiled country. "(Canada's National Report, p.49)

If the government of Canada continues to convey the impression to the global community, through official Internationally circulated documents, that Canadians are concerned about being "stewards" of a "relatively unspoiled wilderness", then the citizens of Canada should legitimately expect that Canada will fulfill this obligation.

There is a maxim of equity which states that "Equity imputes an intention to fulfill an obligation."

This maxim was reaffirmed by the former Ombudsman of British Columbia, Steven Owen:

"To create an expectation is an empty gesture without a promise to fulfill it. Before creating an expectation, an organization must assure itself of its ability to fulfill the promise it implies" (Introduction, Ombudsman Annual Report, 1991)

101 Citizens of Canada can justifiably expect that Canada will adhere to international principles that are part of international agreements signed by Canada, and citizens of Canada can justifiably expect that the courts of Canada will abide by international commitments undertaken by Canada.

102. The Prime Minister, Brian Mulroney, in his address to the General Assembly at the Earth Summit in Rio de Janeiro, 12, June, 1992, indicated the following commitment to the international community:

Our generation has seen our planet from space. We know its beauty and we understand our fragility. We know that nature is part of us as we are a part of nature.

Canada's national soul breathes its life from our forests and plains and mountains and lakes. Our native peoples depend on the environment for their spiritual sustenance and material well-being. Canadians are the stewards of 10 per cent of the world's forests. ...

For Canada, sustainable development is not a slogan it is a prerequisite of our prosperity and a safeguard of our identity. It is also the standard of our responsibility. ...

We are the leaders. We must assume our responsibilities to our own peoples, to each other and to history. We are here to commit our governments to action. The prevention of global climate change and the preservation of the world's animal and plant species is on the top of our agenda.

Countries have a right to manage their forest resources, and humanity has a right to expect that those management decisions will be ecologically wise. Canada wants clear guidelines, on which we all can agree, and a binding international convention which codifies our rights as well as our responsibilities.

... the agreements on climate change and biodiversity require urgent and constructive follow-up...

As political leaders, our job is to force the pace and stretch out the limits of international cooperation. The nations gathered here today have the human genius to create a world free from deprivation and secure from degradation. What remains is for governments to provide the leadership the world so desperately needs.

Let us find that will and marshal it to the task at hand on behalf of the five billion people we represent

Our children, the Rio generation will be our judges and our beneficiaries.

103. In the press release issued at the time of ratifying the Biodiversity Convention in December, 1992. Prime Minister Brian Mulroney conveyed Canada's recognition of the importance of the Convention:

The Convention which emerged from last June's Earth Summit in Brazil, exemplify a global commitment to the principles ... as embodied in Agenda 21 and agreed to at the Earth Summit.  
the Convention on Biological Diversity provides a framework for conserving the planets animal and plant life and maintaining their habitats.

104. Not only has the previous Conservative government conveyed to the global community its commitment to "provide the leadership the world so desperately needs", but also the current Liberal government conveyed the impression to the citizens of Canada that it would demonstrate leadership by ensuring that international obligations under the UNCED Conventions would be adhered to in the case of Clayoquot.

[The Liberal party in its pre-election promises, affirmed that it would preserve Clayoquot Sound to be preserved by making it part of Pacific Rim national Park.]

105. The Appeal will not only address the obligations under legally binding documents but also those under globally adopted documents. The fulfillment of these obligations also draws upon the Common law Doctrine of Legitimate Expectations.

Not only was there evidence of Canada's and B.C.'s agreement at the UN Conference on the Environment and Development (UNCED) to the legally binding documents but also to the globally adopted document such as Agenda 21.

106. In the Appeal evidence will be supplied that the representatives from the B.C. government, the Assistant Deputy Minister of Forests, Wes Cheston, and from the Commission on Resources and Environment, Commissioner Steven Owen indicated B.C.'s commitment to fulfill the obligations under all the UNCED documents, the legally binding as well as the globally adopted. This evidence was referred to in a report on an inquiry requested by the appellant into how B.C. was going to be complying with UNCED obligations. Scotty Gardiner, the Senior Investigator in Resource Issues in the Ombudsman's office, stated that he would not release the information, that the information cannot be requested through the Freedom of Information Act, and that the ombudsman's office and officers are not "Compelled" to appear in court to testify.

107. In the Ombudsman's Report from Senior Investigator of Resource Issues, (Russow/Gage Complaint and Inquiry, File No. 91 06247) April 1993, to a request for an inquiry into how the B.C. government was going to fulfill its obligations under UNCED, the Senior investigator from the Ombudsman's office, in his report on the inquiry responded indicating that he had received confirmation of the government's commitment to comply with international agreements from UNCED:

### Compliance with International Agreements.

Direct personal discussions were held with Mr. Cheston, Assistant Deputy Minister of Operations Division, Ministry of Forests, and Mr. Owen, Commissioner on Resources and Environment. Both Mr. Cheston's and Mr. Owen's responsibilities reflect the government's priority for those issues of concern to you...

From these meetings, as well as from additional discussions with senior staff from the Ministry of Forests and the Ministry of Environment, Lands and Parks, we have determined that BC intends to comply with the agreements signed at the UNCED in June 1992.

He does not specify that the government will comply with only the legally binding Conventions; it would thus appear from his statement that the government will be complying with other globally adopted documents, such as Agenda 21. Through this statement the Provincial government has demonstrated its intention to adhere to principles from Agenda 21, the Rio Declaration and the Biodiversity Convention.

When asked whether a copy of these expressed commitments could be made available for the Leave to Appeal hearing, the Senior Investigator responded that he would not release the information. A request to proceed through the Freedom of Information Act, was denied and the senior investigator indicated that only the documents submitted to the office by the complainant are accessible to the complainant and that none of the other documents could be released. The Ombudsman's office is beyond the Freedom of information Act. It is thus difficult to confirm part of the commitment because Cheston was recently released from his position. Steven Owen has been contacted. His response will be included in the Appeal.

108. Agenda 21 is a comprehensive plan of action which was adopted by the members of the United Nations participating in UNCED. There are numerous principles that form an intrinsic part of this document.

There is throughout the document a consistent recognition of the urgency of the global situation.

“Humanity stands at a defining moment in history. We are confronted with a perpetuation of disparities between and within nations, a worsening of poverty, hunger, ill health and illiteracy, and the continuing deterioration of the ecosystems on which we depend for our well-being...” (1.1 Preamble, Agenda 21)

109. An essential principle from the UNCED documents is the requirement to carry out environmental audits, or full environmental accounting; and to take into account the costs of ecological consequences.

A principle that was affirmed at UNCED and agreed to by Canada was the need to carry out a full life cycle analysis of activities that could have significantly adverse effects. This principle, if complied with, in the forest industry would entail an examination of the environmental impacts of each stage of current forest practices —

impact of the disruption and sudden elimination of a significant portion of an ecosystem through clearcutting; impact of broadcast burns; impact of treatment by pesticides; impact of off-site planting; impact of replacing a forest with a tree farm; impact of planting monocultures; impact of denying species succession; impact of creating increased susceptibility to forest fires; impact of loss of ecologically sound forest associated employment etc. At UNCED there was also a call for "environmental audits", and "full environmental accounting and "taking into account ecological consequences" of aspects related to life cycles of ...resources", and "for taking into account the costs of any ecological consequences."

Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42)

"A full environmental audit of current forest practices has not been undertaken in B.C. The Auditor General has not been requested by government to carry out a full-scale audit of the true costs of the current logging practices, and to compare these costs to those incurred by alternative forestry practices such as ecoforestry. When the Assistant Auditor General was asked by the Appellant, if the Office was going to undertake such an inquiry, which undeniably would be within his mandate, he responded that it would be an almost impossible task and not economically feasible "(Personal Communication, 1993).

110. The requirement to take into account the costs of any ecological consequences is a particularly relevant consideration in assessing "irreparable harm" [see other grounds section B, and the MacMillan Bloedel v Mullin case]

Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42)

111. Another principle that came out of UNCED and was agreed to by Canada. is a the positive-duty-to protect-indigenous-lands principle. This principle reads as follows:

"...recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate" (Agenda 21, 16.3. ii)

**EXHIBIT: K Affidavit** Saul Arbess (to be submitted for the Appeal)

112. Similarly, at the Provincial level if the provincial government imputes that it intends to fulfill an obligation, the citizens should be justified in requiring the government to have the obligation fulfilled.

In a letter dated March, 1992, from both the Provincial Ministry of Forests and the Provincial Ministry of Environment (sent to members of the public presumably from a government mail-out list), the following intention is imputed:

As we, in BC Parks and BC Forest Service begin to work on implementing our components of B.C.'s protected areas under the aegis of the Commission on Resources and Environment, we will be mindful of this Declaration [Parks Protected Areas and the Human Future: the Caracas Declaration] and its implications. Our objective will be to have a system of protected areas which we are proud to present to the world.

Through this intention to be "mindful of this Declaration" the Provincial Government of B.C. through its Ministries of Environment and Forests has recognized the Caracas Declaration and the UN Resolution 37/7 (1982) World Charter for Nature.

**EXHIBIT: L Letter** from Ministries making commitments to the Caracas Declaration.

B.C. has failed to fulfill a commitment made through B.C.'s endorsement of the Caracas Convention (Parks Protected Areas and the Human Future: the Caracas Declaration, February 1992) and in its participation in the Caracas Congress to "move from logging old growth to second growth" (Report on implementation requirements of the Caracas Declaration, Mar. 1992)

113. It will be contended in the Appeal that not only has B.C. not complied with commitments made to the international conference on Parks at Caracas, but also B.C., through its actions in Clayoquot Sound, has failed to adhere to recommendations by the Caracas Congress on means to fulfill the Caracas Declaration

114. Obligations under the "Parks, Protected Areas and the Human Future: The Caracas Declaration" (February, 1992), and under recommendations by the Caracas Congress (CHECK Ref.).

The Caracas Declaration was adopted by over fifteen hundred leaders and participants at the Fourth World Congress on national parks and Protected Areas. (Feb. 1992).

### 3.2. Conserving Biodiversity

The congress urgently requested that all countries urgently undertake surveys to identify additional sites of critical importance for conservation of biological diversity, and wherever possible, accord total protection to them. Harvesting should be relocated from primary to secondary forests and tree plantations in previously deforested areas; or - where this is not possible sustainable forest harvesting systems which favour natural species diversity should be developed and introduced. (p 8)

### 3.3. Conservation on a regional scale

Protected areas have sometimes been seen as islands of nature and tranquility, surrounded by incompatible land uses. But the congress made it clear that such an "island mentality" is fatal in

the long run. The congress recognized that it is unlikely that protected areas will be able to conserve biodiversity if they are surrounded by degraded habitats that limit gene-flow alter nutrient and water cycles and produce regional and global climate change that may lead to the final disappearance of these "island parks." Protected areas, therefore need to be part of broader regional approaches to land management. The term bioregion was used to describe extensive areas of land and water which include protected areas and surrounding lands, preferably including complete watersheds, where all agencies and interested parties have agreed to collaborative management.

### recommendation 3

Global efforts to conserve biological diversity:

"The loss of biodiversity has reached crisis proportion and if present trends continue up to 25 % of the world's species may be sentenced to extinction or suffer severe genetic depletion in the next several decades, accompanied by equally significant and alarming degradation of habitats and ecosystems. This loss of biological diversity is impoverishing the world of its genetic resources, its species, habitats and ecosystems.

All species deserve respect, regardless of their usefulness to humanity. This Principle was endorsed by the UN Assembly when it adopted the World Charter for nature in 1982. The loss of the living richness of the planet is dangerous, because of the environmental systems of the world support all life, and we do not know which are the key components in maintaining their essential functions.

the IVth World Congress on national Parks and Protected Areas recommends that:

- a) governments make the protection of biological diversity, including species and habitat richness, representativeness and scarcity, a fundamental principle for the identification, establishment, management and public enjoyment of national parks and other protected areas;
  - b) all countries urgently undertake surveys to identify additional sites of critical importance for conservation of biological diversity and wherever possible, accord total protection to them
- Harvesting should be relocated from primary to secondary forests and tree plantations in previous deforested areas; or — where this is not possible — sustainable forest harvesting systems which favour natural species diversity should be developed and introduced: (p. 30)

Recommendation 4:  
entitled legal regimes for protected areas.

Protected areas require a mutually reinforcing system of international and national environmental law for their establishment, maintenance and management. International treaties establish a harmonized set of obligations with regard to areas within national jurisdictions and activities having effect beyond national jurisdictional boundaries. These obligations must be reflected in national legislation; otherwise, the treaties cannot be implemented. In turn, innovative national legislation provides a basis and impetus for further international law. The dynamic interaction between the two levels is thus conducive to further progress. (p. 31)

The Caracas Congress which is responsible for interpreting the Declaration made the following recommendations that have been ignored by B.C.:

115. B.C. has failed to move from harvesting primary to secondary forests as recommended by the Caracas Congress

The congress urgently requested that all countries urgently undertake surveys to identify additional sites of critical importance for conservation of biological diversity, and wherever possible, accord total protection to them. Harvesting should be relocated from primary to secondary forests ... (p 8)

116. B.C. has failed to ensure sustainable forest harvesting systems which favour natural species diversity should be developed and introduced: (p. 30)

117. B.C. has failed to prevent incompatible land use. as recommended by the Caracas Congress

Protected areas have sometimes been seen as islands of nature and tranquility, surrounded by incompatible land uses. But the congress made it clear that such an "island mentality" is fatal in the long run. The congress recognized that it is unlikely that protected areas will be able to conserve biodiversity if they are surrounded by degraded habitats that limit gene-flow alter nutrient and water cycles and produce regional and global climate change that may lead to the final disappearance of these "island parks."

118. The Congress also addressed the urgency and the need for global efforts to Global efforts to conserve biological diversity.

"The loss of biodiversity has reached crisis proportion and if present trends continue up to 25 % of the world's species may be sentenced to extinction or suffer severe genetic depletion in the next several decades, accompanied by equally significant and alarming degradation of habitats and ecosystems. This loss of biological diversity is impoverishing the world of its genetic resources, its species, habitats and ecosystems.

All species deserve respect, regardless of their usefulness to humanity. This Principle was endorsed by the UN Assembly when it adopted the UN Resolution 37/7 (1982) World Charter of Nature. The loss of the living richness of the planet is dangerous, because of the environmental systems of the world support all life, and we do not know which are the key components in maintaining their essential functions.

119. It will be shown that it is not only the levels of government that have failed to live up to their stated intentions to fulfill obligations but resource ministries, institutions, organizations and industry have also "imputed an intention to fulfill an obligation," through the Forest Accord, a document which has been signed by Canadian Pulp and Paper Industry, the Council of Forest Industry, Wildlife habitat, Canadian Nature Federation, National Aboriginal Forestry Association, Minister of Forestry, Lands and Wildlife, Alberta, Minister of Natural resources Manitoba, Minister of Forests, B.C. Minister of Parks and Renewable Resources Saskatchewan, Minister of Natural Resources and Energy, New Brunswick, Minister of Natural Resources, Minister of Forestry Canada, Minister of Natural resources Ontario, the following concern and intention was expressed:

- Our forest heritage is part of our past, our present and our future identity as a nation. It is important to maintain a rich tapestry of forests across the Canadian landscape that sustains a diversity of wildlife:
- The spiritual qualities and the inherent beauty of our forests are essential to our physical and our mental well-being
- We will fulfill our global responsibilities in the care and use of forests, maintaining their importance of the environment and the well-being of all living things.]  
March, 2, 1992

120. It will be shown that international customary law places a positive duty to act:

"Considering that, in view of the magnitude and gravity of the new dangers threatening them, it is incumbent on the international community as a whole to participate in the protection of the cultural and natural heritage of outstanding universal value, by the granting of collective assistance which, although not taking the place of action by the State concerned, will serve as an effective complement thereto," (26.1 Convention for the Protection ...of Natural Heritage, 1972).

121. In not agreeing to preserve Clayoquot Sound and in permitting ecologically unsound practices in Clayoquot, Canada and B.C. have failed to comply with legally binding conventions such as the Biodiversity Convention, the Climate Change Convention and the UN Convention on the Protection of Cultural and Natural

heritage, and also has failed to comply with obligations undertaken through globally adopted commitments, such as the Caracas Declaration and Agenda 21 . Citizens of Canada should be able to justifiably expect that Canada will adhere to international principles that are part of international agreements signed by Canada. The citizens of Canada, also, should be able to justifiably expect that the courts of Canada will abide by international commitments made by Canada.

**B. This case also addresses the contempt for statutory law that has been demonstrated by industry, and in particular MacMillan Bloedel, in its non-compliance with statutory law, and by governments in their failure to enforce statutory law, particularly in relation to tree farm license (in the manner of a profit a prendre property right claimed by MacMillan Bloedel)**

122. Evidence will be submitted that B.C. has not only used internal law — the granting of injunctions to justify non-compliance to international obligations but has failed to invoke its own internal law to prevent violations of international obligations.

B.C. has failed to even invoke its own provincial legislation to ensure that it is not in violation with international obligations. The B.C. Ministry of forests has not invoked section 60 of the Forest Act; a section which has given the government discretionary powers to suspend Tree Farm Licenses indefinitely if there is evidence of damage to the natural environment through non-compliance with the Act. There is evidence that the Federal Government and provincial government have failed to enforce their own legislation. Although there have been some convictions against MacMillan Bloedel, the legislation has not been sufficiently enforced, and as a result of non-enforcement international obligations have not been fulfilled.

This section has been enforced by the Ministry of Forests not in a punitive way but in a mitigative way, and consequently no licenses have been suspended for forest practices that have caused serious damage to the natural environment, and canceled under section 61 (cancellation of licenses). If the Ministry of Forests had voluntarily enforced its own legislation, or if there had been a writ of mandamus from the courts to require the Ministry to enforce the Forest Act then the "serious damage to the natural environment" which has occurred would have been minimized. The demonstrations in the forests in the little remaining old growth forests could be attributed in part to the years of the Forest Industries non compliance to the Forest Act and to the years of reluctance on the part of government and the courts to enforce the Forest Act.

123. In the Appeal, affidavit evidence will be submitted that not only has the Ministry of Forests been not enforcing its own legislation but that it has also contributed to the violation of the silviculture sections of the Forest Act. There has been evidence for years that the forest industry has failed to fulfill its obligations related to silviculture and that the government of B.C. has failed to enforce sections in the Forest Act, which require adequate silviculture.

Evidence will also be submitted that the Inventory Branch of the Ministry of Forests became aware of a serious discrepancy between the original estimation of inventory in a block currently being logged by MacMillan Bloedel. It was found through a research study, Omule A.Y., and K.D. Tudor. Report, "Ratio Sampling Analysis" by A.Y. Statistical Decision Support, Forest Inventory Branch, B.C. Ministry of Forests. (March 11), 1993) by inventory specialists that the inventory in Block 6 in the TFL 39 in the Queen Charlottes had been overestimated by over 40 percent. Rather than releasing this

document to the public or calling for suspension of licenses under section 59, the Inventory Branch of the Ministry of Forests asked MacMillan Bloedel to check the findings with their own data. The Appellant and David White became aware of the document and obtained the document through the Freedom of Information Act. It was only at that time that the Ministry of Forests released the information.

**EXHIBIT: M.** Affidavit from David White, former president of Greenpeaks, a silviculture contracting firm, and researcher responsible for uncovering the Inventory document.

124. In the Appeal, affidavit evidence will be submitted that MacMillan Bloedel was aware of alternative economically viable methods of selection logging which would have enabled Mac Millan Bloedel to have fulfilled its obligations under the Forest Act and thus its obligations under the TFL which they claim bestows a property right.

**EXHIBIT: N** Affidavit from Merv Wilkinson, Forester and internationally recognized specialists in selection logging

125. MacMillan Bloedel has not fulfilled its responsibility to protect fisheries, and in fact MacMillan Bloedel has been convicted under section 33 of the Federal fisheries Act for depositing deleterious substances which caused destruction to fish Habitat.

**EXHIBIT: O** Convictions under the Fisheries Act  
Request through Freedom of Information Act for Charges.

126. Evidence was compiled by John Stephen from the Department of Fisheries on non-compliance with Ministry of Forest's TFL Engineering Specifications.  
In this document, Stephen examined sections in the Engineering Specifications and submitted photographs demonstrating Non-compliance of the Forest Company with the Engineering Specifications. He describes the photographs as being random samples illustrating the ineffectiveness to date of environmental protection regulations attached to the TFL 46 document and its cutting Permits. These photographs are specific to the Loop Creek site in TFL 46, and referred to non-compliance of a Co. that is not MacMillan Bloedel. However, this type of evidence has been commonplace throughout the forest industry in British Columbia.

**EXHIBIT: P** John Stephen: M.O.F. 's TFL Engineering Specifications (1991)

127. "Recently there has been further evidence of MacMillan Blondel's non fulfillment of responsibility under the Forest Act. The following is a summary of the findings of the Tripp report which was entitled *The Application and Effectiveness of the Coastal Fisheries forestry guidelines in selected cut blocks on Vancouver Island*" (D. Tripp, April, 1992)

## Abstract

The Coastal Fisheries Forestry Guidelines, alone or in combination with site specific prescriptions, can effectively reduce the number and severity of the impacts experienced on streams in recently logged areas. Compliance with the guidelines and many prescriptions, however, was generally poor, regardless of location or the type of forest license involved. These were the findings of a recent survey of 21 logged cut blocks on Vancouver Island.

There was, on average, one major or moderate impact on one stream for every cut block inspected. Half of these impacts involved a Class 1 or 11 stream. The other half involved Class III or IV streams that were likely to have a negative effect in the near future on more valuable habitat downstream. Since most of the impacts were the result of debris torrents, large build-ups of sediment and debris were the main types of major impacts recorded in all stream classes.

Approximately 60% of the major problems observed were attributed to excess debris loads in steep gully systems, and a failure to appreciate the transport capabilities of such streams during heavy rains. Other contributing factors were failures to fall and yard away from the streams and failures to clean out the excess debris where cross stream yarding was permitted. Poor drainage controls on roads, and spur roads in particular, were responsible for approximately another 25% of the most significant problems, while a combination of landslides and a poorly located gravel pit accounted for the rest of the problems. Some questionable harvest practices in Streamside Management Zones accounted for six minor or moderate problems, but the long-term implication of the problems was beyond the scope of the present survey.

128. In the appeal evidence of violations of the Forest Act, collected by the Valhalla Wilderness Society, will be submitted.

**EXHIBIT:** Documentation of over 150 violations of statutory law prepared by the Valhalla Wilderness Society for a previous court case (to be submitted for the Appeal)

129 There has also been a failure on the part of the Ministry of forests to use its discretionary powers to suspend licenses under the Forest Act to address "serious damage to the natural environment"

The government in its response to Steven Owen June 2, 1993, indicated that "the government intends to firmly enforce standards." The government then indicated that, "imminent environmental damage could result in the immediate suspension of operations under Section 60 of the Forest Act" (p.15).

Section 60 of the Forest Act, reads as follow:

Suspension of rights the regional manager, a district manager or a forest officer authorized by either of them may, by written order and without notice, suspend in whole or part the rights under an agreement where he believes on reasonable and probable grounds that its holder has failed to perform an obligation to be performed by him under the agreement or has failed to comply with this Act or the regulations, and that the failure of performance or compliance is causing or may imminently cause serious damage to the natural environment. 1978.

Since 1978 this section has been in place, and since 1978 "serious damage to the natural environment has occurred. (See EXHIBIT, as an example of this damage). This section has neither been enforced by the Ministry of Forests in a punitive way, nor been requested to be enforced by the Ministry of the Environment. When the Appellant contacted an enforcement officer who had been with the Ministry of Environment for 20 years, and asked him "how often the Ministry of Environment had called upon the Forest Ministry to invoke sections 59,60, and 61 of the Forest Act, his response was that he was unaware of these sections.

Sections 59 and 60 have been enforced by the Ministry of Forests not in a punitive way but in a mitigative way, and consequently no licenses were suspended for forest practices that had caused serious damage to the natural environment, and canceled under section 61 (cancellation of licenses). If the Ministry of Forests had voluntarily enforced its own legislation, or if there had been a writ of mandamus from the courts to require the Ministry to enforce the Forest Act then the "serious damage to the natural environment" which has occurred would have been minimized. The demonstrations in the little remaining old growth forests on Vancouver Island could be attributed in part to the years of the Forest Industries' noncompliance to the Forest Act and to the years of reluctance on the part of government and the courts to enforce the Forest Act.

130. The Government claims that the Forest Practice Code will have a strong enforcement component. On the one hand it is reassuring that the government is finally willing to enforce its legislation, but on the other hand, it is not reassuring that for years environmental harm has occurred because, past governments, as well as the current government, have not been willing to enforce sections 59, 60 and 61 of the Forest Act. For years, environmental groups have brought to the attention of the government that the Forest Act was not being complied with and as a result of non-compliance environmental harm has occurred. For years there has been contempt of the law by both industry and government.

131. In the Appeal it will be noted that a strong enforcement policy — enforcing "kinder and gentler" destructive forest practices such as clear-cut logging will not suffice to enable governments to fulfill international obligations under the Biodiversity Convention.

132. It would appear that the government, in making its decision to log Clayoquot Sound, took into consideration the possible cost of compensation to MacMillan Bloedel that would have resulted from setting aside Clayoquot Sound.

“Often intact ecosystems that have been deserving of preservation have been irreversibly destroyed because it was deemed necessary, if these ecosystems were to be withdrawn from an existing tree farm license, for governments to pay compensation. In the past, compensation has been assessed purely on an economic basis without taking into consideration the true environmental costs. In order to assess the environmental costs of the destruction of significant ecosystems one may need to examine if damage to the natural environment within a significant ecosystem has occurred. Section 60 of the Forest Act does permit the suspension of licenses if environmental damage to the natural environment has occurred as a result of non-compliance with the Forest Act. The potential environmental costs of destroying significant ecosystems as a result of the Ministry of Forests not suspending tree farm licenses when there was evidence of destruction to the natural environment is necessary to include in the assessment of compensation.”(Complaint submitted to the Ombudsman's office for investigation by appellant and Andrew Gage, 1991-1993)

133. Not only has the government been notified about non-enforcement of Section 60 of the Forest Act, but also the ombudsman's office has been notified about this non-enforcement (even at the time that Steven Owen was the Ombudsman). To investigate the lack of enforcement of section 60 of the forests act appears to be certainly within the mandate of Ombudsman's office.

It would appear then that the forest industry has, when causing environmental harm been outside the law, because neither the government, the ministry of Forest, the ministry of environment, or the ombudsman's office has demanded that section 60 be enforced and licenses be suspended, and that licenses be canceled under section 61. If licenses had been suspended under section 60 and canceled under section 61 because of the harm caused to the natural environment (section 60), the environmental harm such as the harm reported in the TRIPP report would not have occurred.

**EXHIBIT: Q Affidavit** re: data on MacMillan Bloedel's current forest practices in Clayoquot Sound submitted by representative from "Forest Watch."

134. In section 28 of the Forest Act there is an indication that one condition of the granting of the license is that logging has to be "sustained." Environmental researcher Jack Etkin expressed the following concern about noncompliance with the responsibilities under the Act.

"MacMillan Bloedel states in their management and working plans that in TFL 44 they will be able to cut about 2.4. million cubic metres of wood a year for the next 200 years. Because they say that 2.4. million is "sustained. We asked the company, how they knew that they could cut 2.4. million cubic metres of wood sustainably for the next 200 years.... they assured us that they have proof that their tree farms will grow sustainably."  
(press release, 1993)

In a follow-up letter received by Etkin from MacMillan Bloedel, the company stated:

"In conclusion, there is no hard, scientific proof that third and fourth generation forests are viable [not viable is defined as being able to survive and grow]. On the other hand, what evidence there is overwhelmingly positive (July 6, 1990).

Etkin (1993) in the Bridge newspaper indicated the following:

"The most frequently cited piece of evidence was FORCYTE, a computer simulation model out of UBC. According to the Director General of Forestry Canada, models like FORCYTE provide "Perhaps the strongest scientific evidence that B.C. forests can be sustainably managed..."

But here is what the developers of FORCYTE have to say about their model. "The model predictions should be viewed with caution...The model has not been validated against any long-term experimental data. Hence the precision and accuracy of the results are unknown'

**EXHIBIT: R Letter** received by Jack Etkin from MacMillan Bloedel (1990)

This suggests that MacMillan Bloedel cannot claim to be fulfilling section 28 of the Forest Act, and consequently one of the conditions that would limit its "right to profit a prendre" has not been fulfilled.

135 Given that MacMillan Bloedel has been in violation over the years of many sections of the Forest Act, Waste Management Act and the Fisheries Act, MacMillan Bloedel has not fulfilled the conditions of the TFL under the

Forest Act, and thus the contracting party has failed to perform its part of the contract. In this case it would be inappropriate to recognize that MacMillan Bloedel has a property right in the nature of a "profit a 'Prendre." Surely the Court would recognize that a right cannot be claimed by one who has not fulfilled the responsibilities contingent upon that right.

**C. The appeal will rely upon a realistic and objective evaluation of equity. In particular the use of an equitable remedy such as an injunction to justify non-performance of provincial and federal statutory law and to justify non-performance of international legal obligations, and international customary law.**

136. Evidence will be submitted that the injunction is an equitable remedy that has been misapplied in the Clayoquot case. Equity could never countenance the destruction of life rearing capacity and life forms in it trust on a massive scale with no genuine regard for future generations.

In the BC Litigation publication, Justice J.A. Norris described the nature of the injunctive remedy in British Columbia Law in the following way:

The remedy [of injunction] of course, is an equitable one. ' The exercise of the equitable jurisdiction is not to be restricted by the straitjacket of rigid rules but is to be based on broad principles of justice and convenience, equity regarding the substance and not merely the facade or the shadow. It moves with time and circumstances. (Justice J.A. Norris)

Although there is a beginning of the recognition of ecological rights in McMillan Bloedel vs. Mullin [1985, BCD Civ 1892-08] there does not yet appear to be a recognition in B.C. courts of the rights of the public to ecological preservation. In McMillan Bloedel vs. Mullin it was decided that

“The claim by an Indian band for 'aboriginal " title to land cannot be 'rejected summarily' and certainly not at the early stages of litigation. Nor must the right to log crown land given by license to a logging Company be ignored. However, in light of the fact that unless the issue of title to the subject land is settled before logging occurs the Indians, if successful, will be deprived of valuable ecological rights, and in further light of the fact that irreparable harm will not result to the logging Company if timber harvest is delayed pending an expedited adjudication of issue of title, the principles applicable to the issue of interlocutory injunctions will militate that the status quo. be maintained.”

Although the above decision does recognize the concept of ecological rights when there is a dispute over ownership of property, it does not go far enough to accommodate the current and emerging evidence of time and circumstances. The international law and treaties and the public, including scientists and all reasonable persons who seriously consider the impact of our actions on future generations are now demanding preservation of unfragmented areas of biological complexity. In the UN Conference on Humans and the Environment 1972, the requirement to preserve our environmental heritage and the requirement to save a representative sample of natural ecosystems for future generations were being recognized:

‘The natural resources of the earth including the air, water, land, flora and fauna and especially representative samples of natural ecosystems must be safeguarded for the benefit of present and future generations (Principle 2)

Man has a special responsibility to safeguard and wisely manage the heritage of wild life and its habitat which are now gravely imperiled by a combination of adverse factors.”  
(Principle 4),

In issues of preservation of ecosystems and ecological rights perhaps the courts should look to international researchers for guidance and to international documents for substance of moral suasion. Research from the international community and international documents could reflect a more accurate estimate of "the time and circumstance" in the domain of forestry issues, than affidavits from forestry companies that seek to perpetuate what is perceived by a substantial sector of the international community as contributing to environmental degradation, soil depletion, loss of biodiversity, loss of genetic diversity and even loss of productivity in their own industry.

The issue that an equitable remedy— an injunction is being used to prosecute citizens of criminal contempt when the justification for granting of this equitable remedy is still being questioned by the courts, will be examined. Reference will be made to the fundamental principle that it appears to be ethically questionable to continue to convict people under an equitable remedy where the legitimacy of the remedy was still under question in the courts.

137. There is the recognition in the MacMillan Bloedel vs. Mullin case of what could be called the "impossibility avoidance" or "the avoidance of a disappearing object principle": This principle is enunciated as follows:

Seaton, who delivered the judgment in the MacMillan v Mullin case, at 151 stated

The proposal is to clear-cut the area. Almost nothing will be left. I cannot think of any native right that could be exercised on lands that have recently been logged. It follows that rights far short of outright ownership might well warrant retaining the area until after a trial.

Seaton affirmed at 151:

I am firmly of the view that the claim to Indian title cannot be rejected at this stage of litigation. The questions raised by the claim are not the type of questions that should be decided on an interlocutory application. A great amount of factual evidence will have to be heard and considered, opinion evidence of those knowledgeable. in these matters will have to be assembled and related to the factual evidence, there will have to be a meticulous study of the law.

Seaton, (at p. 157), stated:

Each of the decisions {[from cases such as Amer. Cyanamid Co. v Ethicon Ltd., [1975] A.C. 396, to Siebart Rustproofing Ltd. v. Ottawa Rustproofing Ont. H.C. 8th February 1978 (unreported). } represents an attempt on the part of the court to see that justice is done. Often it is an attempt to preserve property so that a claimant will not find at the end of a successful trial that the subject matter is gone, and always there is an attempt not to impede others unnecessarily.

Seaton at 157 cited Cotton L.J in Preston v Luck (1884) 27 Ch. D 497 (at 505) referred to an interlocutory injunction:

...The object of which is to keep things in status quo, so that, if at the hearing the Plaintiffs obtain a judgment in their favour, the Defendants will have been prevented from dealing in the meantime with the property in such a way as to make that judgment ineffectual

Seaton at 157 further cited Spry in the Principles of Equitable Remedies, 2nd ed. (1980) after quoting the above, said at p. 423:

A need for protection of this kind most commonly arises where property as to which there is a dispute between the parties is threatened with damage, destruction or removal or where the value of other rights of the plaintiff may be diminished.

Seaton at 157 further referred to this principle as enunciated in Preston v Luck (1884) 27 Ch. D. 497 at 505, referred to an interlocutory injunction:

...the object of which is to keep things in status quo, so that at the hearing the plaintiffs obtain a judgment in their favour, the Defendants will have been prevented from dealing in the meantime with the property in such a way as to make that judgment ineffectual.

Spry in the Principles of Equitable Remedies, 2nd ed. (1980) after quoting the above, said at p. 423

A need for protection of this kind most commonly arises where property as to which there is a dispute between the parties is threatened with damage, destruction or removal or where the value of other rights of the plaintiff may be diminished.

Even MacDonald who dissented in part stated at 168:

"In order to prevent the alleged illegal activity pending trial, an interlocutory injunction is sought. That is so that the question of a permanent injunction after trial will not be rendered academic."

MacDonald stated at 169:

"And the clear message from this court to judges hearing those applications will be that the existing situation should be present while the litigation continues. "

138. This principle enunciated above is to a certain extent an embodiment of a principle of international customary law which is eloquently stated in the Vienna Convention on the Law of Treaties: Under Article 18, a state is obliged to "not defeat the object and purpose of a treaty prior to the entry into force."

139. In the September 15, 1993, before Mr. Justice Drake, application to rescind the injunction the court was asked to consider `the requirement of international obligations related to both the legally binding Conventions from UNCED, signed in 1992, and the globally adopted agreements from UNCED 1992. It was argued that the granting of the injunction would be in violation of the above principle because proceeding with logging when the logging could and would defeat the purpose of any treaty protecting the "ecological rights" within the public trust.

140 The implications of the principle ("impossibility avoidance" or "the avoidance of a disappearing object principle"): enunciated in the MacMillan Bloedel v Mullin case, as well as in Article 18 and 61 of the Vienna Convention on the Law of Treaties, should be considered in relation to the Public Trust Doctrine (Friends Patrai Doctrine). It would appear that if there is a question raised about the legitimacy of eliminating ecological rights within areas coming under the public trust, that full consideration should be given that prior to the discussion and resolution of the question, nothing in the interim should be permitted that would eliminate the ecological rights contained therein. The affirmation of ecological principles contained in the UNCED document, such as the principle of an environmental assessment of any activities that could contribute to a reduction or loss of biodiversity or the principle that would require environmental audits or taking into account ecological consequences or accounting would mean that when considering the irreparable harm and thus the balance of convenience , ecological rights in areas under the public trust doctrine (Friends Patrai Doctrine) should and would have to be taken into consideration.

141. The requirement to take into account the costs of any ecological consequences is a particularly relevant consideration in assessing "irreparable harm" in injunctions. In Agenda 21, the globally agreed to UNCED Action Plan the affirmation of the need to ensure that the costs of any ecological consequences were taken into consideration:

“Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences” (7.42 Agenda 21, UNCED. 1992)

142. In *MacMillan Bloedel vs. Mullin* it was decided that (at p. 146) that "Monetary damages would not be adequate compensation for the potential injury to Indian culture and social structure."

143. In the BC Litigation publication, Justice J.A. Norris described the nature of the injunctive remedy in British Columbia Law in the following way:

The remedy [of injunction] of course, is an equitable one. " The exercise of the equitable jurisdiction is not to be restricted by the straitjacket of rigid rules but is to be based on broad principles of justice and convenience, equity regarding the substance and not merely the facade or the shadow. It moves with time and circumstances." (Justice J.A. Norris, B.C. Litigation, 1991)

144. As stated in *MacMillan Bloedel vs Mullin* by Seaton at 157 there is an affirmation of the essence of injunctive law (interlocutory injunctions) related to attempting on the part of the court to see that justice is done:

Each of the decisions represents an attempt on the part of the court to see that justice is done. Often it is an attempt to preserve property so that a claimant will not find at the end of a successful trial that the subject matter is gone, and always there is an attempt not to impede others unnecessarily.

145 A case is being researched and will be initiated to determine whether Canada, through the actions of B.C. has been in violation of the Biodiversity Convention since the signing of the Convention in June 1992. Until this case is heard nothing should be done on crown lands which could diminish the value of the public trust rights.

146. The equitable principle of "he who comes to equity must come with clean hands" is a well-established principle of equity.

This principle as stated above should have been applied and if a company like *MacMillan Bloedel* has been in violation of statutory law as well as international law it should not be able to benefit from the granting of an equitable remedy such as an injunction. There is also evidence that the injunction is an equitable remedy that has been misapplied in the *Clayoquot* case, and the injunction should be rescinded, and Mr. Justice Drake's decision related to the applicability of international agreements should be overturned.

There is also evidence that the injunction is an equitable remedy that has been misapplied in the *Clayoquot* case.

147. In addition, in the *Clayoquot* trials, the court has condoned not only violations of guarantees in the Canadian Charter of Rights and Freedoms, but

also violations of guarantees in the International Covenant on Civil and Political Rights, such as the following:

In the determination of any criminal charge against him, everyone shall be entitled to the following minimum guarantees, in full equality:

To examine, or have examined, the witnesses against him and to obtain the attendance and examination of witnesses on his behalf under the same conditions as witnesses against him {Article 14 3 (e)}.

[NOTE THAT IN THE CLAYOQUOT TRIALS IN VICTORIA FEW WITNESSES HAVE BEEN PERMITTED TO APPEAR FOR THE DEFENCE]

**EXHIBITS: S Affidavits.** Ann and Merv Wilkinson

There appears to be little recourse for the Clayoquot Protectors than to eventually seek redress through the Optional Protocol International Covenant on Civil and Political Rights which provides the following remedy:

Subject to the provisions of article 1 individuals who claim that any of their rights enumerated in the Covenant have been violated and who have exhausted all available domestic remedies may submit a written communication to the committee for consideration. (Article 2)

19.72 REV2 North American Coastal Temperate Forests  
(Retyped with January 25 Amendments from the floor)

RECOGNISING that temperate coniferous forests, and especially rain forests, constitute a very rare type of ecosystem in the world, originally covering less than one-fifth of one percent of the earth's land surface, and that one half of the earth's original forest of this type occurs along the pacific Coast of North America from northwestern California to southeastern Alaska;

UNDERSTANDING that many endemic and unusual plants and animals occur only in these forests; and that in biomass productivity, the old growth forests (ancient forests) of this biome are unequaled anywhere;

AWARE that more than one half of the Earth's original coastal coniferous forests (ancient forests) have been logged, including more than 40 % of the ancient forests of this type on North America, and that few large unfragmented examples of this type of forest, other than in protected areas, exist outside of British Columbia and Alaska;

MINDFUL of the fact that such ancient forests on Vancouver Island and on the mid-coast of British Columbia are disappearing at a rapid rate as a result of practices that have, to date, not been ecologically sustainable;

ALSO, MINDFUL that past management practices have been controversial, while the US government has enacted legislation to ensure sustainable management of all forests, questions continue to arise;

UNDERSTANDING that the Raincoast Conservation Society, the Sierra Club, and the Western Canada Wilderness Committee have proposed a large network of protected areas, including conservation corridors, in areas of such ancient forests on Vancouver Island and the midcoast of British Columbia;

AWARE of the fact that none of the protected areas that Canada maintains in forest areas along the Pacific Coast have been designated as World Heritage sites under the provisions of the World Heritage Convention[s] and that these ancient forests may be of outstanding universal value;

The General Assembly of IUCN — the World Conservation Union, at its 19th Session in Buenos Aires, Argentina, 17-26 January 1994:

1. URGES the Government of Canada and the United States to properly manage the temperate coastal coniferous forests of the Pacific Coast of North America by establishing appropriate protected areas and by adopting ecologically oriented systems of forest management which can be permanently sustained and which protect biodiversity;
2. CALLS UPON the Governments of Canada and British Columbia to substantially expand the amount of land in networks of protected areas, with conservation corridors, on Vancouver Island and the midcoast of British Columbia, taking into consideration the recommendations of environmental groups active in the regions such as the Raincoast Conservation Society, the Sierra Club and the Western Canada Wilderness Committee;
3. URGES the Government of Canada to consider nominating sites or combinations of sites (such as networks), in these forests as World Heritage sites under the World Heritage Convention[s];
4. RECOMMENDS that special efforts be made by these parties and their citizens to restore degraded parts of these forests and to secure the overall integrity of the biome by linking now separate forest stands

Resolution proposed by Michael McCloskey, Sierra Club USA, in collaboration with Joan Russow (B.C. Canada) member of the IUCN Commission on Education and Communication

27. The dissenting judges had attempted to apply the 1937 Labour Convention case see **EXHIBIT**

27. The 1937 case was distinguished by Brennan J. at 482

Lord Atkin in delivering the reasons for judgment....distinguished between the formation and the performance of treaty obligations. The making of a treaty is a function of the executive, but legislation to implement a treaty is a matter for the legislature. he said in reference to the Canadian constitution (at 348): The obligations imposed by treaty may have to be performed, if at all, by several legislatures and the executive have the task of obtaining the legislative assent not of the one parliament to whom they may be responsible, but possibly of several Parliaments to whom they stand in no direct relation. The question is not how is the obligation formed, that is the function of the executive: but how is the obligation to be performed, and that depends upon the authority of the competent legislature or legislatures. "

Brennan at 485

when the subject matter of a law is the subject of a treaty obligation and is 'indisputably international in character', para (xxix) is available to support the law. the present questions whether a law which creates or affects rights, duties powers or privileges regulating a field of activity which is the subject of a treaty obligation is a law with respect to an external affair, or whether some additional quality, "indisputably international" must be found in the subject of the treaty obligations. ...in Burgess..." at 30: "The external affairs power authorizes the parliament to make a law for the purpose of carrying out or giving effect to a treaty, at least if the treaty is in reference to some matter indisputably international in character." and Mason J said (at 470/91): " There is abundant authority for the proposition that the subject matter extends to Australia's relationships with other countries and in particular to carrying into effect treaties and conventions entered into with other countries and in particular to carrying into effect treaties and conventions entered into with other countries provided at any rate that they are truly international in character.

Brennan at 487

Where a particular aspect of the internal legal order of a nation is made the subject of a treaty obligation, there is a powerful indication that subject does affect the parties to the treaty and their relations one with another. They select that aspect as an element of their relationship, the obligee nations expecting and being entitled in international law to action by the obligor nation in performance of the treaty. And therefore, to subject an aspect of the internal legal order to treaty obligations stamps the subject of the obligation with the character of an external affair.

This is consistent with the view of the majority of the court in *R v Burgess*... at 644 said: "The Commonwealth Parliament was given power to legislate to give effect to international obligations binding the Commonwealth or to protect national rights internationally obtained by the commonwealth whenever legislation was necessary or deemed to be desirable for this purpose." Starke J (at 657) said: The constitution, in the legislative power to make laws with respect to external affairs, recognizes that the Commonwealth will have political relations with other Powers and States, and legislative power is conferred upon it in comprehensive terms, so that it may control those foreign or external relations and implement obligations that may have been assumed in the course of those relations. And Evatt and McTiernan JJ said (at 681): " in truth, the King's power to enter into international conventions cannot be limited in advance of the international situations which may from time to time arise. And in our view the fact of an international convention having been duly made about a subject brings that subject within the field of international relations so far as such subject is dealt with by the agreement."

27. Brennan at 487 affirmed that the mere acceptance of a treaty obligation related to an internal matter, makes the matter an external affairs matter

These views were adhered to in *R v Poole; Ex parte Henry* (no.2) and They were repeated in *Airlines of NSW (No 2)* by Windeyer J (at 152): A law necessary to give effect to a particular treaty obligation of the Commonwealth is a law with respect to external affairs." If Australia, in the conduct of its relations with other nations, accepts a treaty obligation with respect to an aspect to Australia's internal legal order, the subject of the obligation thereby becomes (if it was not previously) an external affair, and a law with respect to that subject is a law with respect to external affairs.

27. Brennan at 487 proposed a criterion for assessing the external affairs nature

I would agree, however, that a law with respect to a particular subject would not necessarily attract the support of para (xxix) if a treaty obligation had been accepted with respect to that subject merely as a means of conferring legislative power upon the Commonwealth Parliament. 26. The power to affect the obligation imposed by a convention lies on the Confederation (federal)

In *RV Burgess: Ex parte Henry* (1936) 55 (at 645/453) the judgment of Stephen J...

His Honour stated (at 646/454) that the content of the external affairs power must be determined by what is generally regarded

at any particular time as part of the external affairs of the nation, describing that as " a concept the content of which lies very much in the hands of the community of nations of which Australia forms a part" ... (p. 689)

Case is authority for the proposition that the power authorizes a law which gives effect to an obligation imposed on Australia by a bona fide international convention or treaty to which Australia is a party (689)

## EXHIBIT

Stephen J. at 445

The constitution confers upon the Parliament of the commonwealth power to make laws for the peace, order and good government of the Commonwealth." It should be made clear that no question arises as to the power of Australia to enter into the convention. The Governor-General exercising the prerogative over of the Crown can make treaties on subjects which are not within the legislative power of the Commonwealth. However, the treaties when made are not self-executing: they do not give rights to or impose duties on members of the Australian community unless their provisions are given effect by statute. The power of the parliament to carry treaties into effect is not necessarily as wide as the executive power to make them. This was made clear by the Judicial Committee in *Attorney-General for Canada v Attorney-General for Ontario* [1937] AC 326 at 348, where their lordships said: "... in a federal State where legislative authority is limited by a constitutional document, or is divided up between different legislatures in accordance with the classes of subject-matter submitted for legislation, the problem is complex. The obligations imposed by treaty may have to be performed, if at all, by several legislatures; and the executive have the task of obtaining the legislative assent not of the one Parliament to whom they may be responsible, but possibly of several Parliaments to work they stand in no direct relation. The question is not how is the obligation formed, that is the function of the executive but how is the obligation to be performed, and that depends upon the authority of the competent legislature or legislatures."

... and at 435 ..in the *Labour Convention 1937* case at 353-4 their lordships pointed out that their decision in that case that legislation of the Dominion of Canadas giving effect to certain conventions was ultra vires did not have the result that Canada was incompetent to legislate in performance of treaty obligations. They said (at 354): in totality of legislative powers, Dominion and Provincial together, she is fully equipped. But the legislative powers remain distributed, and if in the exercise of her new functions derived from her new international status, Canada incurs obligations they must, so far as legislation be concerned, when they deal with Provincial classes of subjects, be dealt with by the totality of powers, in other words by co-operation between the Dominion and the Provinces."

Koowarta v Bjelke-Petersen and others Queensland v Commonwealth of Australia

2-4 March, 11 May 1982 High Court of Australia, Aust. Law Reports.

Constitutional law — Commonwealth — Legislative Powers — act implementing an international treaty

it was held Sections 9 and 12 were valid laws with respect to external affairs within s 51 (xxix) of the Constitution,

Per Stephen J. at 418. There existed a quite precise treaty obligation on a subject of major importance in international relationships, which called for domestic implementation within Australia

Per Mason J. at 418 It would seem to follow inevitably from the plenary nature of the external affairs power that it would enable the parliament to legislate not only for the ratification of a treaty but also for its implementation by carrying out any obligation to enact a law that Australia assumed by the treaty

Brennan J. at 418 If Australia in the conduct of its relations with other nations accepted a treaty obligation with respect to an aspect of Australia's internal legal order, the subject of the obligation thereby because (if it was not previously) an external affair, and a law with respect to that subject was a law with respect to external affairs.

Wilson at 480 state" the task of ensuring the co-operation of the States may present a political challenge, although the developing practices of including State representation in commonwealth delegations to international conferences on subjects which may call for implementation by State legislatures augurs well for future co-operation in the pursuit of an effective foreign policy and the maintenance of good international relations:

Wilson at 480 [dissenting] raised the Judicial Committee in Attorney-General for Canada v Attorney-General for Ontario [1937]

Where their Lordships expressed the view that in the totality of Dominion and Provincial legislative powers, Canada was fully equipped to implement any international obligations that might be incurred. The decision in that case, though not the accuracy of the observation to which I have referred was subjected to a good deal of criticism.

However, a recent assessment appears in an article by Edward McWhinney in the Canadian Yearbook of International law (1969) vol. 7 p3 wherein (at 4-5) the author wrote: 'Not merely has the Labour Convention decision not rendered impossible the conduct of a national Canadian foreign policy. In fact, no single example has ever been cited, in the years since 1937...where its rationale has presented any practical difficulties, or even mild inconvenience, in the conduct of Canada's foreign relations. At the concrete, empirical level, it has in fact proved easily possible for Canadians to live with the decision...'

The 1937 Canadian Labour case was used by the dissenting judge at 434 It should be made clear that no question arises as to the power of Australia to enter into the convention. The Governor-General exercising the prerogative over of the Crown can make treaties on subjects which are not within the legislative power of the Commonwealth. However, the treaties when made are

not self-executing: they do not give rights to or impose duties on members of the Australian community unless their provisions are given effect by statute. The power of the parliament to carry treaties into effect is not necessarily as wide as the executive power to make them. This was made clear by the Judicial Committee in *Attorney-General for Canada v Attorney-General for Ontario* [1937] AC 326 at 348, where their lordships said: " in a federal State where legislative authority is limited by a constitutional document, or is divided up between different legislatures in accordance with the classes of subject-matter submitted for legislation, the problem is complex." The obligations imposed by treaty may have to be performed, if at all, by several legislatures; and the executive have the task of obtaining the legislative assent not of the one Parliament to whom they may be responsible, but possibly of several Parliaments to work they stand in no direct relation. The question is not how is the obligation formed, that is the function of the executive but how is the obligation to be performed, and that depends upon the authority of the competent legislature or legislatures."

... and at 435 ..in the *Labour Convention 1937* case at 353-4 their lordships pointed out that their decision in that case that legislation of the Dominion of Canada's giving effect to certain conventions was ultra vires did not have the result that Canada was incompetent to legislate in performance of treaty obligations. They said (at 354): in totality of legislative powers, Dominion and Provincial together, she is fully equipped. But the legislative powers remain distributed, and if in the exercise of her new functions derived from her new international status, Canada incurs obligations they must, so far as legislation be concerned, when they deal with Provincial classes of subjects, be dealt with by the totality of powers, in other words by co-operation between the Dominion and the Provinces."

Stephen J. at 445

The constitution confers upon the Parliament of the commonwealth power to make laws for the peace, order and good government of the Commonwealth with respect to the division of powers.

[In the Australian Act, the Racial Discrimination Act" there is the following statement:

"to make provision for giving effect to the Convention

Stephen at 452

"So long as treaties departed little from their early nature as compacts between princes, having no concern with domestic affairs, the conflict was muted: but in the century international conventions have come to assume a more extensive role. They prescribe standards of conduct for both governments and individuals having wide application domestically in areas of primarily regional concern, the very areas which, in federations, have tended to be entrusted to the legislative competence of the regional units of governments. This has necessarily exacerbated the problem which federations encounter in the implementation of international treaties while emphasizing the need for regional units in federations to recognize the legitimacy of national governments' increased concern regarding domestic observance of internationally agreed norms of conduct. "

Stephen at 453 Thus areas of what are of purely domestic concern are steadily contracting and those of international concern are ever expanding.

Stephen at 454 post war growth in consensual international law.

Stephen at 454 What has occurred is rather a growth in the content of "external affairs"; this growth reflects the new global concern for human rights and the international acknowledgment of the need for universally recognized norms of conduct particularly in relation to the suppression of racial discrimination.

Stephen at 456

Even were Australia not a party to the Convention, this would not necessarily exclude the topic as a part of its external affairs. It was contended on behalf of the Commonwealth that, quite apart from the Convention, Australia has an international obligations to suppress all forms of racial discrimination because respect for human dignity and fundamental rights and thus the norm of non-discrimination on the grounds of race, is now part of customary international law, as both created and evidenced by state practices and as expounded by jurists and eminent publicists.

Stephen at 456. In the present cases it is not necessary to rely upon this aspect of the external affairs power since there exists a quite precise treaty obligation on a subject of major importance in international relationships, which calls for domestic implementation within Australia.

Mason at 459 It would seem to follow inevitably from the plenary nature of the power that it would enable the parliament to legislate not only for the ratification of a treaty but also for its implementation by carrying out any obligation to enact a law that Australia assumed by the treaty.

Mason 459 recognized that; "It is a well-settled principle of the common law that a treaty not terminating a state of war has no legal effect upon the rights and duties of Australian citizens and is not incorporated into Australian law on its ratification by Australia (*Chow Hung Ching v R* (1948) .... not self-executing'

... to achieve this result the provisions have to be enacted as part of our domestic law, whether by Commonwealth of States statute. Section 51 (xxix), arms the Commonwealth Parliament with a necessary power to bring this about. So much was unanimously decided by the court in *R v Burgess: Ex parte Henry* (1936) 55 CLR 608. There the power enabled the Commonwealth Parliament to legislate so as to incorporate into our law the provisions of the Paris Convention for the regulation of aerial navigation.

Mason at 459 ... the consequence of the failure [ of the *R. v Burgess: Ex parte Henry* (1936)] would have been to leave the decision on whether Australia should comply with its international obligations in the hands of the individual States as well as the Commonwealth, for the commonwealth would then lack sufficient legislative power to fully implement the treaty. The ramifications of such a fragmentation of the decision-making process as it affects the assumption and implementation by Australia of its international obligations are

altogether too disturbing to contemplate. Such a division of responsibility between the Commonwealth and each of the States would have been a certain recipe for indecision and confusion, seriously weakening Australia's stance and standing in international affairs. Fortunately, the approach in Burgess has since been confirmed by *R v Poole; Ex parte Henry (no.2)* 1939 61 CLR...

Mason at 462. doubtless the framers of the Constitution did not foresee accurately the extent of the expansion in international and regional co-operation which has occurred since 1900. ...There is no reason at all for thinking that the legislative power conferred by s 51 (xxix) was intended to be less than appropriate and adequate to enable the Commonwealth to discharge Australia's responsibilities in international and regional affairs. mason at 463 Increasing emphasis is given in the United Nations and in regional organizations to the pursuit by international treaties of idealistic and humanitarian goals. It is important that the Commonwealth should retain its full capacity through the external affairs power to represent Australia, to commit it to participation in these developments when appropriate and to give effect to obligations thereby undertaken.

Mason 466. Broadly speaking the test which they favoured was whether in substance the legislation carries out or gives effect to the Convention.

Mason at 467 " On the broad view which I take of the power it extends to the implementation of the international convention on the... on the Elimination of all forms of Racial Discrimination. It is an international treaty to which Australia is a party which binds Australia in common with other nations to enact domestic legislation in pursuit of the common objective of the elimination of all forms of racial discrimination.

But I would go further and say that even on the more cautious expression of the scope of the power by Dixon in Burgess, it would extend to the implementation of the convention.

Mason at 468 At the level of international law the means chosen to attain this end was the formulation of the Convention. It imposes on each of the many parties to it an obligation to eliminate racial discrimination in its territory. The failure of a party to fulfill its obligations becomes a matter of international discussion, disapproval, and perhaps action by way of enforcement.

Murphy at 471 discussed "the obligations to take legislative measure...

Murphy at 472 Preservation of the world's endangered species, maintenance of universal standards of human rights. are for Australia as well as other nations, internal as well as external affairs.

Murphy at 473. the people of the States are entitled as well as obliged to have the legislative and executive conduct of those affairs which are part of Australia's external affairs carried out by the Parliament and executive Government of Australia.

Wilson at 480 state" the task of ensuring the co-operation of the States may present a political challenge, although the developing practices of including

State representation in commonwealth delegations to international conferences on subjects which may call for implementation by State legislatures augurs well for future co-operation in the pursuit of an effective foreign policy and the maintenance of good international relations:

Wilson at 480 [dissenting] raised the Judicial Committee in *Attorney-General for Canada v Attorney-General for Ontario* [1937]

Where their Lordships expressed the view that in the totality of Dominion and Provincial legislative powers, Canada was fully equipped to implement any international obligations that might be incurred. The decision in that case, though not the accuracy of the observation to which I have referred was subjected to a good deal of criticism.

However, a recent assessment appears in an article by Edward McWhinney in the *Canadian Yearbook of International Law* (1969) vol. 7 p3 wherein (at 4-5) the author wrote: 'Not merely has the Labour Convention decision not rendered impossible the conduct of a national Canadian foreign policy. In fact, no single example has ever been cited, in the years since 1937...where its rationale has presented any practical difficulties, or even mild inconvenience, in the conduct of Canada's foreign relations. At the concrete, empirical level, it has in fact proved easily possible for Canadians to live with the decision...'

Brennan J. at 482 also referred to *Labour Convention Case*... Lord Atkin in delivering the reasons for judgment... distinguished between the formation and the performance of treaty obligations. The making of a treaty is a function of the executive, but legislation to implement a treaty is a matter for the legislature. he said in reference to the Canadian constitution (at 348): The obligations imposed by treaty may have to be performed, if at all, by several legislatures and the executive have the task of obtaining the legislative assent not of the one parliament to whom they may be responsible, but possibly of several Parliaments to whom they stand in no direct relation. The question is not how is the obligation formed, that is the function of the executive: but how is the obligation to be performed, and that depends upon the authority of the competent legislature or legislatures. "

Brennan at 485 when the subject matter of a law is the subject of a treaty obligation and is 'indisputably international in character', para (xxix) is available to support the law. the present questions whether a law which creates or affects rights, duties powers or privileges regulating a field of activity which is the subject of a treaty obligation is a law with respect to an external affair, or whether some additional quality, "indisputably international" must be found in the subject of the treaty obligations. ...in *Burgess*..." at 30: "The external affairs power authorizes the parliament to make a law for the purpose of carrying out or giving effect to a treaty, at least if the treaty is in reference to some matter indisputably international in character." and Mason J said (at 470/91): " There is abundant authority for the proposition that the subject matter extends to Australia's relationships with other countries and in particular to carrying into effect treaties and conventions entered into with other countries and in particular to carrying into effect treaties and

conventions entered into with other countries provided at any rate that they are truly international in character.

Brennan at 487 Where a particular aspect of the internal legal order of a nation is made the subject of a treaty obligation, there is a powerful indication that subject does affect the parties to the treaty and their relations one with another. They select that aspect as an element of their relationship, the obligee nations expecting and being entitled in international law to action by the obligor nation in performance of the treaty. And therefore, to subject an aspect of the internal legal order to treaty obligations stamps the subject of the obligation with the character of an external affair. This is consistent with the view of the majority of the court in *R v Burgess...* at 644 said: "The Commonwealth Parliament was given power to legislate to give effect to international obligations binding the Commonwealth or to protect national rights internationally obtained by the commonwealth whenever legislation was necessary or deemed to be desirable for this purpose." Starke J (at 657) said: The constitution, in the legislative power to make laws with respect to external affairs, recognizes that the Commonwealth will have political relations with other Powers and States, and legislative power is conferred upon it in comprehensive terms, so that it may control those foreign or external relations and implement obligations that may have been assumed in the course of those relations. And Evatt and McTiernan JJ said (at 681): " in truth, the King's power to enter into international conventions cannot be limited in advance of the international situations which may from time to time arise. And in our view the fact of an international convention having been duly made about a subject brings that subject within the field of international relations so far as such subject is dealt with by the agreement."

Brennan at 487 "These views were adhered to in *R v Poole*; *Ex parte Henry* (no.2) and They were repeated in *Airlines of NSW (No 2)* by Windeyer J (at 152): A law necessary to give effect to a particular treaty obligation of the Commonwealth is a law with respect to external affairs." If Australia, in the conduct of its relations with other nations, accepts a treaty obligation with respect to an aspect to Australia's internal legal order, the subject of the obligation thereby becomes (if it was not previously) an external affair, and a law with respect to that subject is a law with respect to external affairs.

Brennan at 487 I would agree, however, that a law with respect to a particular subject would not necessarily attract the support of para (xxix) if a treaty obligation had been accepted with respect to that subject merely as a means of conferring legislative power upon the Commonwealth Parliament. 26. The power to effect the obligation imposed by a convention lies on the Confederation (federal)

In *RV Burgess*: *Ex parte Henry* (1936) 55 (at 645/453) the judgment of Stephen J...

His Honour stated (at 646/454) that the content of the external affairs power must be determined by what is generally regarded at any particular time as part of the external affairs of the nation, describing that as " a concept the content of which lies very much in the hands of the community of nations of which Australia forms a part" ... (p. 689)

Case is authority for the proposition that the power authorizes a law which gives effect to an obligation imposed on Australia by a bonafide international convention or treaty to which Australia is a party (689)

EXHIBIT: EXCERPTS FROM THE FRANKLIN DAM CASE

1. does the enactment of the law constitute an implementation by Australia of an obligation imposed on it by the Convention? conversely would Australia be in breach of an obligation imposed on it by the Convention., if it failed to enact the law or some law substantially to the same effect?
2. Does the subject-matter of the Convention to which the law gives effect in the manner in which it is treated, involve in some way a relationship with other countries or with persons or things outside Australia?
3. Is the subject-matter of the convention to which the law gives effect, something which, although it relates to domestic activity, affects relations between Australia and another or other countries?

the first of the three tests seeks to express the idea that it is the implementation of an obligation imposed on Australia by a treaty that attracts the external affairs power, that it is the treaty obligation and its implementation that constitutes the relevant subject or matter of external affairs. As I pointed out in *Koowarta* (at 648-50/457-62), the treaty itself is a matter of external affairs, as is its implementation by domestic legislation. The insistence in *Burgess* of the legislation to carry into effect provisions of the convention in accordance with the obligations which that Convention imposed on Australia is not inconsistent with what I have said, though it does raise a question as to the scope of the legislative power in this application to a treaty, ...

At this point it is sufficient to say that there is no persuasive reason for thinking that the international character of the subject matter or the existence of international concern is confined to that part of a treaty which imposes an obligation on Australia. A provision in a treaty which is designed to secure to Australia a benefit may be just as much a matter of international concern, possessing an international character, with a potential to affect Australia's relationships with other countries, as a provision in a treaty which imposes an obligation upon Australia.

... But when we have regard to international affairs as they are conducted today, when the nations of the world are accustomed to discuss, negotiate, co-operate and agree on an ever-widening range of topics, it is impossible to enunciate a criterion by which potential for international action can be identified from topics which lack this quality.

... p691

It is suggested that if a topic becomes the subject of international cooperation or an international convention it is necessarily international in character —

...

The fact of entry into and of ratification of, an international convention, evidences the judgment of the Executive and of Parliament that the subject matter of the convention is of international character and concern and that its implementation will be a benefit to Australia...

the court should accept and act upon the decision of the Executive government and upon the expression of the will of Parliament in giving legislative ratification to the treaty or convention. (p. 692)

... Koowarta makes the point that the content of the external affairs power has expanded greatly in recent times along with the increase in the number of international conventions and the extended range of matters with which they deal (ALJR) at 645-6, 650; (ALR) at 453-4, 462-3

Section 51(xxix)

"There is no reason at all for thinking that the legislative power conferred by s51(xxix) was intended to be less than appropriate and adequate to enable the Commonwealth to discharge Australia's responsibilities in international and regional affairs... As the object of conferring the power was to equip the Commonwealth with comprehensive capacity to legislate with respect to external affairs, it is not to the point to say that such is the scope of external affairs in today's world that the content of the power even to the Commonwealth is greater than it was thought to be in 1900."

Accordingly, it conforms to established principle to say that s51 (xxix) was framed as an enduring power in broad and general terms enabling the Parliament to legislate with respect to all aspects of Australia's participation in international affairs and of its relationship with other countries in a changing and developing world and in circumstances and situations that could not be easily foreseen in 1900. (p693) This circumstance is often overlooked by those who are preoccupied with the impact that the exercise of the power may have in areas of legislation traditionally regarded by the States as their own. The consequences to Australia resulting from an inadequate Commonwealth legislative power with respect to external affairs — which represents the price to be paid for the preservation to the States of these areas of legislation — were emphasized in Koowara (ALJR) at 650-1, 656; (ALR)

... it must always be remembered that we are interpreting a constitution broad and general in its terms, intended to apply to the varying conditions which the development of our community must involve."

Despite Norris' assessment of the "equitable remedy of the injunction" in most injunctive cases, the condition for granting an injunction appears to be restricted to a "balance of convenience" (the term "convenience" appears to be interpreted as meaning suitability; and the term "just" appears to be absent indicating perhaps that the courts do not believe that there is a significant distinction between "suitability" and "just"). It is understandable that the courts, in deciding between two competing economic claims, would approach the claims as being a balance of convenience. Not all conflicts, however, can always be justly resolved by balancing conveniences. Further, cases between short term economic claims and long-term ecological concerns of potential irreversible destruction surely must not be resolved by misconstruing an ecological right as being one of convenience, and an economic privilege as being one of irreparable harm as had been done in *Wiigyet vs District Manager*. ∞ FULL

In judicial decisions related to conflicts between short term economic interests and long-term ecological concerns the courts in using equitable remedies must reexamine fundamental principles of justice and equity, so as to ensure that the legal system fosters not inhibits justice and equity. It may also be necessary to accept a limitation on freedoms: i.e., that which was considered to be a right may now only be deemed to be a privilege, and in being a privilege it should receive different and more intense scrutiny.

The global system is presently attaining or approaching an ecological state of irreversibility or privation. The time has passed for the perpetuation of precedence reflecting the exclusive reliance on narrowly defined "convenience" and "balance of convenience" or conflict between "convenience and irreparable damages or harm", and reliance on Forest Company affidavits as a basis for granting injunctions. There appears to be a serious discrepancy or lack of correspondence between the criteria for making injunctive decisions and the current recognition of time and circumstance as reflected by concerns in the international scientific and academic community and by proclamations in international documents.

The need to redefine irreparable damage is made evident in the previously mentioned *Wiigyet vs. District Manager* case. International and national documents could assist the court in defining irreparable damage so that the court could "move with time and circumstance" (Norris).

## A F I D A V I T

I, Joan Russow, of 1230 St. Patrick St. of the city of Victoria, Province of British Columbia MAKE OATH AND SAY AS FOLLOWS:

1. THAT I am a Sessional lecturer in Global Issues in the Environmental Studies Program at the University of Victoria; the Chair of the International Affairs Caucus of the British Columbia Network (BCEN); a member of an International Commission-the IUCN (World Conservation Union) Commission on Education and Communication, and founder of the International Law and Obligations Institute (ILOI) — an institute established to monitor compliance to International obligations. Ironically, the Law Society which ignores international law opposed the registration of the name

2. THAT I attended the New York Prep Com (March 1992), the UNCED Earth Summit and Global Forum (June, 1992), the meeting of the World Heritage Committee, and the Annual General Meeting of the IUCN.

3. THAT I am a researcher in an international Harvard -based project, which examines climate change, ozone depletion and acid rain documentation and implementation of policy in eight different countries; and that I am involved in co-coordinating a "Global Compliance Project" for the 1995 UN Conference in Beijing.

4. THAT I have extensive experience in analyzing and categorizing research data and in carrying out content analysis in different disciplines. Since 1985 I have been doing a content analysis of international documents. I have analyzed statements in the following International legal instruments and UN resolutions:

Universal Declaration of Human Rights, 1948; Stockholm Conference on the Human Environment, 1972; UN Conservation of Natural Heritage, 1972; UN Convention on International Trade in Endangered Species of Wild Fauna and Flora, 1973; International Covenant of Social, Cultural Rights; International Covenant on Civil and Political Rights, 1976; the Vienna Convention of Treaties, 1978; the World Charter of Nature, 1982; Non-proliferation of Nuclear weapons; Vienna Convention for the Protection of Ozone, 1985; Montreal Protocol on Substances that Deplete the Ozone Layer, 1987 (and London and Copenhagen Protocols); UN Convention on the Rights of the Child, 1989; Convention for the Control of trans-boundary Movements of Hazardous Wastes (Basel Convention 1989); Environmental Assessment Review of trans-boundary Projects; 1991 ASEAN; Jakarta Declaration. the Caracas Declaration, 1992; Rio Declaration and Agenda 21, 1992, Convention on Biological Diversity, 1992; UN Framework Convention on Climate Change, 1992.

In particular, I have done a content analysis of the UNCED documents, and extracted over 200 principles enunciated in those documents. In October, 1993, at the University of Victoria, I also organized a panel discussion on "International Law and Obligations: Implications for the Clayoquot".

5. THAT I am currently involved in a university project examining B.C. and Canadian environmental legislation

6. THAT I have had input into the drafting of several international documents: a proposed Earth Charter for UNCED; the NGO Earth Charter at the UNCED Global Forum; and the IUCN "Covenant" prepared by the IUCN Commission on Environmental Law.

7. THAT I have reviewed international documents such as the UNCED Forest Principles document, and indicated its inconsistency with other international documents; I have reviewed federal documents such as the proposed Charlottetown Accord, and the CIDA guidelines for international projects, and indicated the inconsistency of these documents with other international and federal documents. I have reviewed provincial documents such as CORE Charter, B.C. Environmental Bill of Rights, the B.C. Prevention Act, the Forest Practices Code; B.C. Standards for Pollution Prevention, and indicated the inconsistency of these documents with other Federal and international documents.

8 THAT I will submit evidence about the following:

6.1. THAT there is a strong indication from statements from international documents, and from experts that there is an urgency to address the global environmental situation, and that "inaction is negligence" (Digby McLaren, Past President of the Royal Society of Canada, Keynote address, Global Issues Conference, 1991).

EXHIBIT A: Evidence of statements about urgency by Science Council of Canada; by the Royal Society of Canada; by the Concerned Scientists, Warning to Humanity; and by the international community in international documents.

6.2. THAT there is a duty expressed in international documents to act to address this urgency, and through international customary law as expressed in the International Covenant on Civil and Political Rights, and in UN Resolution 37/82, a duty has been placed on states to adopt such legislative or ... measures as may be necessary to give effect ... to international documents, and BC has undertaken this duty as a result of this international customary law.

EXHIBIT B: Evidence of statements of duty expressed internationally, nationally and provincially.

6.3. THAT Canada, as well as B.C., has failed in many cases to exercise this duty and comply with its obligations. In particular, Canada has failed to comply with the Convention on Biological Diversity which Canada signed (June, 1992) and ratified (December, 1992); and which has been in force since December 1993; and that Canada under Article 18 of the Convention of Treaties, must not "defeat the purpose of the Treaty in the interim between the signing of the treaty and the coming into force of the treaty."

EXHIBIT C: Evidence that Canada has defeated the purpose of the Treaty since June 1992 by failing to conserve biodiversity, by failing to identify biodiversity, by failing to invoke the precautionary principle to justify the banning of ecologically unsound practices, and by failing to carry out an environmental assessment review of anything that could contribute to the loss or reduction of biodiversity.

6.4. THAT Canada has invoked internal law to justify not complying with these obligations (through claiming that B.C. is not bound by these documents and thus not required to comply. Under Article 27 of the Vienna Convention of Treaties, Canada is bound not to invoke internal law to justify non-compliance to international treaties.

EXHIBIT D1: Evidence that Canada under the Convention of Treaties has undertaken not to invoke internal law to justify not fulfilling international treaty obligations.

EXHIBIT D2: Evidence that indicates that B.C. as well as Canada is bound by these international obligations whether through legally binding documents such as the Biodiversity Convention and the Climate Change Convention, or through international customary law including the Common Law Doctrine of Legitimate Expectation, and evidence that the 1937 International labour Supreme Court Decision can be distinguished in the case of the Convention on Biological Diversity.

6.5. THAT Canada has invoked internal law to justify not complying with these obligations through granting injunctions that prevent the fulfilling of these obligations. Under Article 27 of the Vienna Convention of Treaties, Canada is bound not to invoke internal law to justify non-compliance to international treaties.

EXHIBIT E : Evidence that B.C. has not only used internal law — the granting of injunctions to justify non compliance to International obligations but has failed to invoke its own internal law to prevent violations of international obligations.

6.6. THAT many of the Clayoquot Protectors were informed through circulated material and proclamations that there were international obligations undertaken by Canada and B.C., and that these obligations were being violated in the Clayoquot.

EXHIBIT F: Evidence of examples of documents about B.C. 's non-compliance to international obligations circulated to Clayoquot protectors.

6.7. THAT there has been international condemnation of British Columbia through a resolution from IUCN, an international organization with representation from 125 countries, including representation from governments and non-governmental organizations. I am a member of the Commission on Education and Communication of the IUCN (the World Conservation Union)

—an organization that has both non-governmental and governmental representation, and academic and professional representation from 125 countries. I was instrumental in January 1994 in assisting in the drafting of the "North American Temperate Rainforest" Resolution which passed with only one state abstaining, Canada. The IUCN undertakes to circulate any resolution passed at the Annual General Meeting to all states in the United Nations, and it is the responsibility of the proposer of a resolution to monitor the fulfillment of IUCN resolutions, and to submit documentation about the fulfillment of the resolutions for distribution at the next IUCN Annual General Meeting.

EXHIBIT G: Evidence of International condemnation of forest practices in British Columbia, and of international call for the protection of a large network of original temperate rainforests as recommended by the Western Canada Wilderness Committee whose proposal for a network includes Clayoquot Sound.

6.8. THAT it may not be equitable to prosecute citizens through the use of an equitable remedy— an injunction- when the granting of the equitable remedy is still under question in the courts, and when the equitable remedy is being used against those who call for the adherence to international obligations. I also propose that the issuance of equitable remedy such as an injunction which has usually been issued to prevent irreparable harm, has in this case of Clayoquot sound been issued against those who strive to prevent irreparable harm and call for the adherence to international obligations. [Note: that there have been several attempts to set aside the injunction, the last one being heard in January with no decision yet being handed down in June, and citizens are still being tried as criminals for contempt of court for their not complying with the injunction]

EXHIBIT H: Evidence that the injunction is an equitable remedy that has been misapplied in the Clayoquot case.

In the BC Litigation publication, Justice J.A. Norris described the nature of the injunctive remedy in British Columbia Law in the following way:

The remedy [of injunction] of course, is an equitable one. ' The exercise of the equitable jurisdiction is not to be restricted by the straitjacket of rigid rules but is to be based on broad principles of justice and convenience, equity regarding the substance and not merely the facade or the shadow. It moves with time and circumstances. (Justice J.A. Norris)

6.9. THAT there is a positive duty upon citizens to ensure that a state adheres to its international obligations.

EXHIBIT I: Evidence to support the proposal that it is the responsibility and duty of individuals to act to ensure compliance with international obligations

6.10. THAT in cases of potential irreversibility there may not be time for citizens to wait to exhaust all domestic measures before bringing their concerns to the international forum; and THAT the exercising of this positive duty as was done in Clayoquot Sound by peacefully assembly to protest the non-compliance with international obligations should not be considered to be a demonstration of criminal contempt of court. When established members of the community, such as representatives of government at international conferences, senior scientists from national institutions indicate the gravity and urgency of the global situation, including deforestation, it is inequitable for the courts to impose injunctions that were traditionally an equitable remedy to prevent irreparable harm on those who try to prevent irreparable harm. It is equally inequitable to charge those who call upon governments to live up to their commitments as criminals while those who do not adhere to international commitments, federal laws and provincial statutes are fined occasionally for their "transgressions." Since Canada has made these commitments outlined in the above exhibits, and because these commitments are inconsistent with the continuing to log in significant stands of unfragmented watersheds the injunction should have been rescinded because the injunction is contributing the non-fulfillment of international, national and provincial obligations.

In my opinion the court has violated principles of equitable law, such as the principle that "he who comes to equity must come with clean hands," by granting an equitable remedy to a party, MacMillan Bloedel, that itself has been in violation of international, federal and provincial law. When the ignoring of this equitable principle was brought to the attention of Judge Drake, he ruled that, in equity, "equity follows the law." If that were the case, and if international laws, such as the UN Resolution 37/7 (1982), federal laws, such as the Fisheries Act, and provincial laws, such as the Forest Act had been applied years ago, tree Farm licensees would have been suspended and canceled, and forest practices changed. In the absence of the court's willingness to enforce international law and federal and provincial statutory law, "equity has not followed the law."

In the Clayoquot, the court failed to invoke the law, and instead has demonstrated contempt for its own laws, by misconstruing the purpose of the equitable remedy of an injunction, which is to prevent irreparable harm. In circumstances where the state has failed to exercise its duty to act, and the court has failed to enforce the law, it is the state and the court that has demonstrated contempt for the law. This contempt has been shown at all three levels:  
international, federal and provincial.

*In addition, in the Clayoquot trials, the court has condoned not only violations of guarantees in the Canadian Charter of Rights and Freedoms, but also violations of guarantees in the International Covenant on Civil and Political Rights, such as the following:*

In the determination of any criminal charge against him, everyone shall be entitled to the following minimum guarantees, in full equality:

To examine, or have examined, the witnesses against him and to obtain the attendance and examination of witnesses on his behalf under the same conditions as witnesses against him {Article 14 3 (e)}.

[NOTE THAT IN THE CLAYOQUOT TRIALS IN VICTORIA FEW WITNESSES HAVE BEEN PERMITTED TO APPEAR FOR THE DEFENCE]

It is institutions not individuals that have demonstrated contempt for law and justice.

There appears to be little recourse for the Clayoquot Protectors than to eventually seek redress through the Optional Protocol International Convention of Civil and Political Rights which provides the following remedy:

Subject to the provisions of article 1 individuals who claim that any of their rights enumerated in the Covenant have been violated and who have exhausted all available domestic remedies may submit a written communication to the committee for consideration. (Article 2)

Ombudsman

In a letter from the Ombudsman's office indicating the findings of the Ombudsman's office (1993) related to the Russow/Gage inquiry into the way the B.C. government will be fulfilling international commitments: the senior investigator for the Ombudsman's office conveyed the commitment of B.C. to the UNCED obligations:

Compliance with International Agreements.

Direct personal discussions were held with Mr. Cheston, Assistant Deputy Minister of Operations Division, Ministry of Forests, and Mr. Owen, Commissioner on Resources and Environment. Both Mr. Cheston's and Mr. Owen's responsibilities reflect the government's priority for those issues of concern to you...

From these meetings, as well as from additional discussions with senior staff from the Ministry of Forests and the Ministry of Environment, Lands and Parks, we have determined that BC intends to comply with the agreements signed at the UNCED in June 1992.

Canada and B.C. are also bound by the UN convention on Cultural and natural Heritage

Not to do anything that could not to invoke internal law to justify the performance of a treaty

Here are two letters that I wrote in relation to the designation of a network of forests being designated as international heritage sites.

1. Letter to Arthur Campeau; I think this letter got lost in the government shift. Usually, Campeau is good at responding to letters. Unfortunately, I did not follow up with another letter. A redraft of the letter could be resubmitted to John Fraser's office. Perhaps signed by the Friends and the Ecological Rights Association.

2. Letter to President of World Heritage Committee. I did receive a response from the president of the World Heritage Committee. He did not agree with my interpretation of the "heritage in peril clause." He contends that this designation only applies to sites that have already been nominated by the state, approved by the IUCN, and accepted by the World Heritage Committee to be placed on the heritage list. Once a site has been placed on a world heritage list, and the state does not protect it then the site can be placed on the heritage in danger list. I think that we can argue that the intention of the Convention was expressed in the Preamble (the duty placed on the international community to identify sites of outstanding universal value), and that the drafters of the Convention did not envision that states would not be interested in preserving these sites.

Joan Russow (In person)    Appearing for the Applicants

John J.L. Hunter                      Appearing for the Respondent

Place and Date of Hearing              Vancouver, British Columbia

October 25, 1994

Place and Date of Judgment              Vancouver, British Columbia

December 7, 1994

***Court of Appeal for British Columbia***

***MacMillan Bloedel Limited***

***- v. -***

***Joan Russow and Betty Kleiman***

***- and -***

***Sheila Simpson et al.***

***Reasons for Judgment of the Honourable Mr. Justice Carrothers (In Chambers)***

- 1 The applicants before me, Joan Russow and Betty Kleiman, by "Notice of Application for Leave to Appeal" filed October 13, 1993, seek leave to appeal an order of Mr. Justice Drake made September 17, 1993, dismissing an application for an order rescinding the order of Mr. Justice Hall made on August 26, 1993, granting interim injunction relief and extending other injunctions until August 31, 1994, or until trial which ever shall be earlier.
- 2 This application is best understood in the context of its involvement in that series of injunctions granted and subsequently varied and extended by a number of judges of the Supreme Court of British Columbia between September 1991 and the summer of 1993, and prohibiting interference with the logging operations of the respondent MacMillan Bloedel Limited in its tree farm licence in the area northwest of Kennedy Lake on Vancouver Island and in the vicinity of Clayoquot Sound.

Of particular concern is that order which I have mentioned of August 26, 1993, made by Mr. Justice Hall granting fresh injunctive relief and the extension of injunction orders previously granted and which were about to expire.

3 On August 23, 1994, the present application for leave to appeal came on in Court of Appeal chambers before Madam Justice Proudfoot, who, advertent to the fact that the injunction itself would expire on August 31, 1994, and that there are totally new grounds of appeal being advanced with reference to this leave application which were not covered in a companion appeal from Mr. Justice Hall's order (which had been heard in this Court January 20 and 21, 1994), adjourned the matter generally.

4 On September 30, 1994, judgment of this Court in the companion appeal of the order of Mr. Justice Hall was delivered and it is reported indexed as **MacMillan Bloedel Ltd. v. Simpson** 1994 943 (BC CA), (1994), 96 B.C.L.R. (2d) 201. Macfarlane J.A. describes the nature of that appeal at p. 206:

- 1 This appeal [from reflex, (1993), 106 D.L.R. (4th) 556] concerns the granting of injunctions to restrain conduct forming part of a mass public protest against government forest policy.
- 2 The appeal concerns the validity of interim injunctions granted at the behest of a private party, MacMillan Bloedel Limited, which prohibited named defendants, John Doe, Jane Doe and Persons Unknown, and "all persons having notice of the order" from conduct interfering with alleged private property rights, where the conduct enjoined may not only affect private property but may also be a public wrong for which a remedy lies under the **Criminal Code**.
- 3 In this case, identified and unidentified persons protesting government forestry policy had blocked a road providing access to the logging operations of MacMillan Bloedel Limited, thereby preventing the company from exercising its alleged property rights. The appellants say the conduct was proscribed by **Criminal Code** s. 430(1) (mischief) and s. 423(1)(g) (blocking or obstructing a highway).

(my emphasis)

- 5 The present applicants fell into that category of persons which I have emphasized in the above passage. That appeal was dismissed. The present applicants did not avail themselves of the opportunity to participate in that appeal. Notwithstanding that, the present applicants are bound by the result which makes the subject appeal moot on its main issue. It is not customary for this Court to hear an appeal which is moot. On that ground alone I would refuse leave to appeal.
- 6 At the chambers hearing before me on October 25, 1994, of the application for leave to appeal, the applicant Joan Russow made extensive submissions which she herself called "a lecture" rather than an argument. The applicant Russow submitted that there was a failure to bring to the attention of Mr. Justice Hall that his granting and extension of the injunctive relief could contribute to non-compliance with international obligations of Canada and its courts on the basis that clear cutting in the Clayoquot Sound area was inconsistent with Canada's obligations under a United Nations convention on biodiversity. Further this applicant suggested that, in the application before Mr. Justice Drake, for rescission of Mr. Justice Hall's order, Mr. Justice Drake erred in his assessment of international law, particularly in relation to biodiversity and climate change issues as affected by current forest industry practices.
- 7 The lengthy submission reflects the large assemblage of material contained in the applicants' leave book, which cannot be summarized. I have taken the time to read and consider substantially all of it. I have not been shown and I have been quite unable to discern or identify any pertinent or applicable principle of international law, whether developed by custom and usage, treaty or convention, or legislative or judicial determination, which falls within the judicial capacity and function of the courts of this province. In my opinion, there is no issue in this case to be advanced on an appeal which warrants the attention of this Court.

COMMENT:

AT FIRST IN THE APPEAL, HUNTER CLAIMED: "SINCE YOU WERE ARRESTED, YOU DO NOT COME TO THE COURT WITH CLEAN HANDS."

I TOLD HIM THAT I HAD NOT BEEN ARRESTED IN CLAYOQUOT SOUND

THEN THE NEXT TIME WE WERE IN COURT, HE STATED "THE APPEAL SHOULD NOT BE HEARD BECAUSE I HAVE NO STANDING."

8 Leave to appeal must be refused.

COMMENT

( ) EXHIBIT:

**EVIDENCE OF LAWYER'S UNWILLING TO USE INTERNATIONAL LAW**  
Through Freedom of Information I obtained cabinet document in which the BC government had endorsed the Framework Convention on Climate Change, and the Convention on Biological Diversity. I had urged lawyers within the Sierra Legal Defence and Cameron Ward lawyers who were acting on behalf of The Friends of Clayoquot Sound, and Greenpeace, respectively, to use this document to demonstrate that the Province of British Columbia was bound by the Conventions and could not rely on the 1937 Supreme Court Labour Convention case, and that the 1936 radio case was a relevant precedent. Greg McDade QC, formerly with the Sierra Legal Defence refused to use international law in environmental cases, but he ridiculed me and told that judges in BC do not take into consideration international law. He also discredited me for using international law and undermining issues. Cameron Ward responded that using international law in the Clayoquot case, when the case went to the Supreme Court, would muddy the waters.

#### **BACKGROUND FOR THE FREEDOM OF INFORMATION REQUEST**

37. Initially when I contacted Premier Harcourt's office to request information about the consultation process with the Federal government surrounding the deliberation at UNCED, I was told that there was no official consultation. It was when I was on a train to Montreal, only by chance I saw, Arthur Campeau –the Canadian Ambassador for the Environment at the UN- whom I had met previously. I told him that it was important for me to know about the extent of consultation with the BC government prior and during Rio, and that I had been told that there had not been official consultation and that I was puzzled because I had seen John Cashore seated with the Canadian Delegation at the UN. Arthur Campeau told me that he had actually seen a cabinet document endorsing the two conventions from Rio.

I then contacted Premier Harcourt's office and asked specifically for the Cabinet document endorsing the conventions from Rio, and within the month I had received the 12-page document with extensive deletions.

It would appear that B.C. played a significant role in the provincial endorsement of the UNCED Conventions by moving the endorsement and by seeking cabinet support

Jaime Alley, former representative for corporate affairs in the Ministry of the Environment, indicated that the provincial governments insisted on not being just another stakeholder in the consultation process but on having government to government consultation"

"Province endorsed the ratification. we agreed with Canada to ratify it. Provincial endorsement. the move to endorse the Conventions John Cashore, the then B.C. Minister of Environment" Cashore went to Cabinet and sought their support and endorsed the ratification and state that to the CCME meeting that it was approved by cabinet"

"Barbara MacDougal, wrote to all provincial constitutional ministers seeking their advice prior to ratification" (Personal Communication, August, 1994)

"There was continuous consultation you need to contact the CCME for details"

36. In the Appeal it will be contended that B.C. through a letter prior to August 1992, the then constitutional minister of B.C., the Hon Moe Sihota indicated to the Hon. Barbara McDougall, The Secretary for External Affairs, B.C.'s support for the Biodiversity and Climate Change Conventions, was bound not to defeat the purpose of the Conventions:

The Hon. Moe Sihota , the then Minister Responsible for Constitutional Affairs communicated to the Hon Barbara McDougall, Minister of State for External Affairs for Canada B.C.'s support for the Convention on Biological Diversity and for the Framework Convention on Climate Change (November 4, 1992, in the B.C. Cabinet Submission , entitled "UNCED follow-up: Endorsement of International Convention on Climate change and Biological diversity") [Note that Russow, on July 17, 1994, made an application through the Freedom of Information Act for a copy of this letter of this letter is being requested through the Freedom of Information Act].

35. In this Cabinet submission, dated November 4, 1992, the B.C. government affirmed that it was bound by the Biodiversity Convention and the Framework Convention on Climate Change:

Canada signed binding International Conventions on climate Change and Biodiversity..and indicated its support for ...a "Global Green Plan" for sustainable development, entitled Agenda 21.

36. Provincial cabinet endorsement of the Biodiversity and Climate Change Conventions binds them to not defeat the purpose of the Convention. In a document obtained through the Freedom of information Act there was evidence of the Provincial cabinet endorsement for the ratification of the Biodiversity and Climate Change Conventions:

"UNCED follow-up: Endorsement of International Convention on Climate change and Biological diversity" November 4, 1992.

38. Evidence will be presented to indicate the assessment of Canada's responsibility for B.C.'s actions in relation to other states.

When the question of Canada's responsibility for actions of B.C. that could impact on the fulfilling of the Convention was raised the IUCN (World Heritage

Union) meeting of the Commission on Environmental Law. Several of the lawyers who had served as advisers to the International Court of Law or to the United Nations, concurred that Canada could be held accountable for B.C.'s non-compliance with international legal obligations under the two Conventions signed at UNCED.

**THAT B.C. IS ALSO BOUND BECAUSE OF COMMITMENTS MADE TO THE FEDERAL GOVERNMENT AT THE CABINET LEVEL**

(Note document is not included because the cabinet document which was obtained through the Freedom of Information Act, has excluded sections under Section 12 of the Freedom of Information Act. For the court purposes, I would presume that the complete document could be obtained).

**EXHIBIT: E UNCED Follow-up: Endorsement of International Convention on Climate change and biological diversity"**  
(p.26, in text)

**EXHIBIT: EVIDENCE OF JUDGES IN BC SHOWING DISRESPECT FOR INTERNATIONAL LAW**

( ) **THAT** In 1993, I organized a panel on Clayoquot Sound and International Law at the University over 300 participated; It was broadcast on Shaw

( ) **THAT** in 1992 and 1993, I submitted documents to the Roundtable CORE process which was chaired by Stephan Owen. I criticized the Roundtable as being an arena of competing interests that also glorified conflict of interest. I proposed that there be instead principle-based decision making drawn from internationally agreed to principles.

**EXHIBIT**

**Statement of Obligation  
Conservation and Ecologically Sound Practices**

Joan Russow  
Sessional Lecture, Global Issues in Sustainability  
Environmental Studies Program  
University of Victoria

Humanity stands at a defining moment in history. We are confronted with a perpetuation of disparities between and within nations, a worsening of poverty, hunger, ill health and illiteracy, and the continuing deterioration of the ecosystems on which we depend for our well-being. ... (1.1 Preamble, Agenda 21)

## **Statement of Obligation Conservation and Ecologically Sound Practices**

**"Maxim of Equity: Equity imputes an intention to fulfill an obligation."  
(Snell's *Equity* 1990)**

***Canada has made international commitments, and the public can impute an intention to fulfill these obligations***

***Convention of treaties:***

### **recognition of urgency**

- *Biological diversity is being significantly reduced by certain human activities, (preamble, Convention of Biological Diversity)*
- *Importance of biological diversity for evolution and for maintaining life sustaining systems of the biosphere, (preamble, Convention of Biological Diversity)*
- *Conservation of biological diversity is a common concern of humankind, (preamble, Convention of Biological Diversity)*
- *This natural wealth is being eroded at an unprecedented rate, because of the rapid growth in human numbers, the uneven and often excessive consumption of natural resources, mistaken and socially harmful styles of development, global pollution and defective economic regimes, so that the future of humanity is now threatened (Caracas declaration)*
- *Many people must modify their styles of living and the world community must adopt new and equitable styles of development, based on the care and sustainable use of the environment, and the safeguarding of global life-supporting systems (Caracas declaration)*

### **Intention: Compliance with international agreements**

Canada continually indicates its professed concern for the environment in a way that should entitled Canadians to expect actions that reflect this concern. For example, in the preface of Canada's National Report, which was submitted to the Earth Summit in Rio, the Canadian government gave the impression that Canadians were "stewards" observing their "environmental responsibility."

as stewards of a vast and beautiful land, and as a people intimately connected to the environment, Canadians are aware of their environmental responsibilities (Canada's National Report, Preface).

And further in the section on the "quality of life", the Canadian government stated

"As a small population with a large land mass, Canadians have access to relatively unspoiled wilderness areas rich in wildlife ... Canada has an

international reputation as a beautiful, safe and mostly unspoiled country” (Canada's National Report, p.49).

“If the government of Canada continues to give the impression to the global community that Canadians are concerned about being "stewards" of a "relatively unspoiled wilderness”, then the citizens of Canada have the equitable right to expect that Canada will fulfill this expectation.” (Doctrine of expectation)

Citizens of Canada can justifiably expect that Canada will adhere to international principles that are part of international agreements signed by Canada, and citizens of Canada can justifiably expect that the courts of Canada will abide by international commitments made by Canada.

### **Statement of Obligation**

#### **Conservation and Ecologically Sound Practices**

Similarly, at the Provincial level if the provincial government imputes that it intends to fulfill an obligation, the citizens should be justified in having the obligation fulfilled.

- a letter from the Ombudsman's office indicating the findings of the Ombudsman's office (1993) related to the Russow/Gage inquiry into the way the B.C. government will be fulfilling international commitments.

#### 2 Compliance with International Agreements.

Direct personal discussions were held with Mr. Cheston, Assistant Deputy Minister of Operations Division, Ministry of Forests, and Mr. Owen, Commissioner on Resources and Environment. Both Mr. Cheston's and Mr. Owen's responsibilities reflect the government's priority for those issues of concern to you...

“From these meetings, as well as from additional discussions with senior staff from the Ministry of Forests and the Ministry of Environment, Lands and Parks, we have determined that BC intends to comply with the agreements signed at the UNCED in June 1992.” (Gardiner, 1993)

Through this statement the Provincial government has demonstrated the intention to adhere to principles from Agenda 21, the Rio Declaration and the Biodiversity Convention.

- a letter from both the Provincial Ministry of Forests and the Provincial Ministry of Environment (March, 1992) in which the following intention is imputed:

As we, in BC Parks and BC Forest Service begin to work on implementing our components of B.C.'s protected areas under the aegis of the Commission on Resources and Environment, we will be mindful of this Declaration [the Caracas Declaration: Parks Protected Areas and the Human Future] and its implications. Our objective will be to have a system of protected areas which we are proud to present to the world.

In the Caracas Declaration; Parks Protected Areas and the Human future is the recognition of the following international documents:

bearing in mind the message of *Caring for the Earth: A strategy for Sustainable Living, The Global Biodiversity Strategy*. launched at this Congress, and the earlier messages of the World Conservation /Strategy, the World Charter for Nature and the World Commission on Environment and Development, CD

Through this intention to be "mindful of this Declaration" the Provincial government through its Ministry of Environment and Forests has recognized the CARACAS Declaration and the UN Resolution 37/7 (1982) World Charter for Nature.

The government of Canada has imputed the intent to fulfill obligations under the UNCED documents, the CARACAS Declaration and the World Charter of Nature

Prepared by ERA, the Ecological Rights Association  
1230 St. Patrick St. Victoria, B.C. CANADA Ph. 604-380-2563. FAX- 604-385-0068

**Statement of Obligation**  
**Conservation and Ecologically Sound**  
**Practices**  
**Principles delineating Obligation**

**Principle that international law shall be reflected in the law and practice of the state**

The principles set forth in the present Charter shall be reflected in the law and practice of each State, as well as a that international level (14, World Charter of Nature).

**Principle of moral code of action regarding every form of life**

• Every form of life is unique, warranting respect regardless of its worth to man, and to accord other organisms such recognition's, man must be guided by a moral code of action (Preamble, World Charter of Nature)

**Principle of intrinsic value of biological diversity**

• Recognition of the intrinsic value of biological diversity ... (Preamble Biodiversity Convention)

**Principle of intrinsic worth of nature**

• Nature has intrinsic worth and warrants respect regardless of its usefulness to humanity (Caracas Declaration).

### **Principle of maintenance of essential ecological processes**

-Lasting benefits from nature depend upon the maintenance of essential ecological processes and life support systems, and upon the diversity of life forms, which are jeopardized through excessive exploitation and habitat destruction by man (Preamble, World Charter of Nature)

-Lasting benefits from nature depend upon the maintenance of essential ecological processes and life support systems, and upon the diversity of life forms, which are jeopardized through excessive exploitation and habitat destruction by man (Preamble, World Charter of Nature).

### **Principle of limit of natural capacity for regeneration**

Living resources shall not be utilized in excess of their natural capacity for regeneration (3 a World Charter of Nature).

### **Principle of burden of proof of benefit being placed on the proponent of intervention into the ecosystem**

Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature, and where potential adverse effects are not fully understood, the activities should not proceed (11 (b) World Charter of Nature).

### **Principle of rehabilitation of areas degraded by human activity**

Areas degraded by human activities shall be rehabilitated for purposes in accord with their natural potential and compatible with the well-being of affected populations 16. All planning shall include, among its essential elements, the formulation of strategies for the conservation of nature, the establishment of inventories of ecosystems and assessments of the effects on nature of proposed policies and activities; all of these elements shall be disclosed to the public by appropriate means in time to permit effective consultation and participation (11 e World Charter of Nature).

### **Principle of early intervention and monitoring to protect ecosystems**

- The status of natural processes, ecosystems and species shall be closely monitored to enable early detection of degradation or threat, ensure timely intervention and facilitate the evaluation of conservation policies and methods (19, World Charter of Nature).

### **Principle of informed action**

- There is general lack of information and knowledge regarding biological diversity and of the urgent need to develop scientific, technical and institutional capacities to provide the basic understanding upon which to plan and implement appropriate measures (Preamble, Convention of Biological Diversity).

### **Principle of anticipation and reduction at source**

- It is vital to anticipate, prevent and attack the causes of significant reduction or loss of biological diversity at source (preamble, Convention of Biological Diversity).

**Precautionary principle**

- where there is a threat of significant reduction or loss of biological diversity, lack of full scientific certainty should not be used as a reason for postponing measures to avoid or minimize such a threat (Preamble, Convention of Biological Diversity).

**Principle of in-situ conservation**

- the fundamental requirement for the conservation of biological diversity is the *in-situ* conservation of ecosystems and natural habitats and the maintenance and recovery of viable populations of species in their natural surroundings (Preamble, Convention of Biological Diversity).

**Principle of intergenerational equity:**

- To conserve and sustainably use biological diversity for the benefit of present and future generations (Preamble, Convention of Biological Diversity).

**Principle of sustainable use and intergenerational equity**

- The use of components of biological diversity in a way and at a rate that does not lead to the long-term decline of biological diversity, thereby maintaining its potential to meet the needs and aspirations of present and future generations (Definition, Convention of Biological Diversity).

**Principle of ecological diversity**

- Means the variability among living organisms from all sources including, *inter alia*, terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are part; this includes diversity within species, between species and of ecosystems (Definition. Convention of Biological Diversity).

**Principle of ecosystem as a dynamic complex**

- "*Ecosystem*" means a dynamic complex of plant, animal and micro-organism communities and their non-living environment interacting as a functional unit (Definition. Convention of Biological Diversity).

**Principle of in-situ conservation**

- "*In-situ conservation*" means the conservation of ecosystems and natural habitats and the maintenance and recovery of viable populations of species in their natural surroundings and, in the case of domesticated or cultivated species, in the surroundings where they have developed their distinctive properties (Definition. Convention of Biological Diversity).

**Principle of identification of activities likely to have significant adverse impacts on the conservation**

- Identify processes and categories of activities which have or are likely to have significant adverse impacts on the conservation and sustainable use of biological diversity, and monitor their effects through sampling and other techniques (7 c Convention for Biological Diversity).

**Principle of establishing system of protected areas**

- Establish a system of protected areas or areas where special measures need to be taken to conserve biological diversity (8 a, Convention for Biological Diversity).

**Principle of sustainable use of biological diversity**

- Regulate or manage biological resources important for the conservation of biological diversity whether within or outside protected areas, with a view to ensuring their conservation and sustainable use (8 c, Convention for Biological Diversity).

**Principle of protection of ecosystems**

- Promote the protection of ecosystems, natural habitats and the maintenance of viable populations of species in natural surroundings (8 d, Convention for Biological Diversity).

**Principle of environmentally sound development adjacent to protected areas**

- Promote environmentally sound and sustainable development in areas adjacent to protected areas with a view to furthering protection of these areas (8 e, Convention for Biological Diversity).

**Principle of rehabilitation and restoration of degraded ecosystem**

- Rehabilitate and restore degraded ecosystems and promote the recovery of threatened species, *inter alia*, through the development and implementation of plans or other management strategies (8 f, Convention for Biological Diversity).

Prepared by ERA, the Ecological Rights Association

1230 St. Patrick St. Victoria, B.C. CANADA Ph. 604-380-2563. FAX- 604-385-0068

**Statement of Obligation****Conservation and Ecologically Sound****Practices****Principles of Obligation****Principle of protecting and encouraging traditional cultural use (10c, Convention for Biological Diversity)**

- Protect and encourage customary use of biological resources in accordance with traditional cultural practices that are compatible with conservation or sustainable use requirements (10 c Convention for Biological Diversity).

**Principle of remedial action**

- Support local populations to develop and implement remedial action in degraded areas where biological diversity has been reduced (10d Convention for Biological Diversity).

**Principle of promoting understanding of importance and measures required for conservation of biological diversity and sustainable use**

- Promote and encourage understanding of the importance of, and the measures required for, the conservation of biological diversity, as well as its propagation through media, and the inclusion of these topics in educational programmes (13, a. Convention of Biological diversity)
- “Cooperate, as appropriate, with other States and international organizations in developing educational and public awareness programmes, with respect to conservation and sustainable use of biological diversity” (13, b. Convention of Biological diversity).

**Principle of environmental impact assessment of projects likely to have significant adverse effects on biodiversity**

- Introduce appropriate procedures requiring environmental impact assessment of its proposed projects that are likely to have significant adverse effects on biological diversity with a view to avoiding or minimizing such effects and, where appropriate, allow for public participation in such procedures (14 a Convention of Biological Diversity).

**Principle of taking into account environmental consequences**

- Introduce appropriate arrangements to ensure that the environmental consequences of its programmes and policies that are likely to have significant adverse impacts on biological diversity are duly taken into account (14 a Convention of Biological Diversity).

**Principle of Environmental impact assessment should be carried out of projects likely to have significant impacts upon biological diversity**

- “Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... ”(Agenda 21, 15.5 k).

**Principle of positive duty to protect indigenous lands.**

- “The lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate” (Agenda 21, 16.3. ii).

**Principle of value of non-damaging-use**

- “The implications of the harvesting of forest resources for other values of the forest should be taken fully into consideration in the development of forest policies. It is also possible to increase the value of forest through non-damaging uses such as ecotourism ...” (Agenda 21, 11.22).

Prepared by ERA, the Ecological Rights Association  
1230 St. Patrick St. Victoria, B.C. CANADA Ph. 604-380-2563. FAX- 604-385-0068

**Principle of Environmental impact assessment should be carried out of projects likely to have significant impacts upon biological diversity**

- “Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity...” (Agenda 21, 15.5 k)

The British Columbia government has failed to insist on an environmental impact assessment on the potentially significant impact of current forest practices, such as clear-cut logging, on biodiversity. Even though, as admitted by Dale Lovick, the Chair of public hearings on the B.C. Environmental Assessment Act, the public was demanding for forest practices to be included on the list of projects and activities which should require an environmental assessment., forest practices appear to be excluded from this Act.

In jurisdictions where an environmental impact assessment has been carried out, practices, typical of those carried out currently in BC forests, have been assessed as being destructive of biodiversity. For example, a German biologist specializing in biodiversity indicated that:

“The practice of clear-cutting, followed by artificial reforestation has undoubtedly many technical and organizational advantages. In the course of time, however, soil scientists and ecologists found out that the practice of clear-cutting automatically leads to considerable drawbacks:

-wounding of the soil surface through logging operations.

- Risk of erosion

-High irradiation and higher climatic extremes alter the microclimate, the flora and the micro flora and deteriorate the growing conditions for a number of valuable tree species. - -Soil compression and a reduction of species richness

-An accelerated decomposition of organic matter occurs, combined with a wash out of nutrients, and the eutrophication of ground water, rivers and lakes occur”

(Dr Schutt, Biological Department, University of Munich, Environmental Ethics Conference, 1992, Vancouver)

### **Principle of full life cycle analysis of activities that could have significantly adverse effects.**

This principle if complied with in the forest industry would entail an examination of the environmental impacts of each stage of current forest practices. At UNCED there was also a call for “environmental audits”, and “full environmental accounting of aspects related to life cycles of ...resources”, and “for taking into account the costs of any ecological consequences.”

- Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits (20.20 e)
- Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (7.42)

A full environmental audit of current forest practices has not been undertaken in B.C. the Auditor general has not been requested by government to carry out a full-scale audit of the true costs of the current logging practices, and to

compare these costs to those incurred by alternative forestry practices such as ecoforestry.

**Principle related to positive mandate-to conserve**

- “Establishing, expanding and managing, as appropriate to each national context, protected area systems, which includes systems of conservation units for their environmental, social and spiritual functions and values, including conservation of forests in representative ecological systems and landscapes, primary old-growth forests, conservation and management of wildlife, nomination of world Heritage Sites under the World Heritage ... and conservation of biological diversity and the traditional forest habitats of indigenous people, forest dwellers and local communities;” (Agenda 21, 11.15 b)

This principle is a reaffirmation of the principle established and endorsed by Canada in 1972 in the Convention for the Preservation of Cultural and Natural Heritage.

- Noting that the cultural heritage and the natural heritage are increasingly threatened with destruction not only by the traditional causes of decay, but also by changing social and economic conditions which aggravate the situation with even more formidable phenomena of damage or destruction"
- Considering that deterioration or disappearance of any item of the cultural or natural heritage constitutes a harmful impoverishment of the heritage of all the nations of the world."
- Considering that the existing international conventions, recommendations and resolutions concerning cultural and natural property demonstrate the importance, for all the peoples of the world, of safeguarding this unique and irreplaceable property, to whatever people it may belong"

"Considering that parts of the cultural or natural heritage are of outstanding interest and therefore need to be preserved as part of the world heritage of [humankind] as a whole"

"Considering that, in view of the magnitude and gravity of the new dangers threatening them, it is incumbent on the international community as a whole to participate in the protection of the cultural and natural heritage of outstanding universal value, by the granting of collective assistance which, although not taking the place of action by the State concerned, will serve as an effective complement thereto,"

Canada has not lived up to its international commitment to preserve a significant area of international worth: a network of intact old growth watershed, conservation corridors including Clayoquot sound (this type of extensive preservation has currently been carried out in Australia, and Australia has applied to have this network of temperate rainforests designated as an international heritage site at the recent meeting in 1993 of the World Heritage Committee at UNESCO)

4. the positive-duty-to protect-indigenous-lands principle. This principle reads as follows:

recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate” (Agenda 21, 16.3. ii)

A fifth principle that came out of UNCED and was agreed to by Canada is the recognition of non-damaging-use value principle. This principle reads as follows:

the implications of the harvesting of forest resources for other values of the forest should be taken fully into consideration in the development of forest policies. It is also possible to increase the value of forest through non-damaging uses such as ecotourism ...” (Agenda 21, 11.22)

#### CONVENTION FOR THE PROTECTION OF THE WORLD CULTURAL AND NATURAL HERITAGE (PARIS,23 NOVEMBER 1972) (CPCNH)

Noting that the cultural heritage and the natural heritage are increasingly threatened with destruction not only by the traditional causes of decay, but also by changing social and economic conditions which aggravate the situation with even more formidable phenomena of damage or destruction, (CPCNH)

Considering that deterioration or disappearance of any item of the cultural or natural heritage constitutes a harmful impoverishment of the heritage of all the nations of the world, (CPCNH)

Considering that protection of this heritage at the national level often remains incomplete because of the scale of the resources which it requires and of the insufficient economic, scientific and technical resources of the country where the property to be protected is situated, (CPCNH)

Recalling that the Constitution of the Organization provides that it will maintain, increase and diffuse knowledge, by assuring the conservation and protection of the world's heritage and recommending to the nations concerned the necessary international conventions (CPCNH)

Considering that the existing international conventions recommendations and resolutions concerning cultural and natural property demonstrate the importance, for all the peoples of the world of safeguarding this unique and irreplaceable property, to whatever people it may belong, (CPCNH)

Considering that parts of the cultural or natural heritage are of outstanding interest and therefore need to be preserved as part of the world heritage for [mankind] as a whole, (CPCNH)

Considering that, in view of the magnitude and gravity of the new dangers threatening them, it is incumbent on the international community as a whole to participate in the protection of the cultural and natural heritage of outstanding universal value, by the granting of collective assistance which, although not taking the place of action by the State concerned, will serve as an effective complement thereto,(CPCNH)

Considering that it is essential for this purpose to adopt new provisions in the form of a convention establishing an effective system of collective protection of the cultural and natural heritage of outstanding universal value, organized on a permanent basis and in accordance with modern scientific methods, (CPCNH)

## 1. Definitions of the Cultural and the Natural Heritage

### Article 1

For the purposes of this Convention, the following shall be considered as "cultural heritage" monument: architectural works, works of monumental sculpture and paintings, elements or structures of an archaeological nature, inscriptions, cave dwellings and combinations of features, which are of outstanding universal value from the point of view of history, art or science: (CPCNH)

groups of buildings: groups of separate or connected buildings which, because of their architecture, their homogeneity or their place in the landscape, are of outstanding universal value from the point of view of history, art or science;

sites: works of man or the combined works of nature and of man, and areas including archaeological sites which are of outstanding universal value from the historical, aesthetic, ethnological or anthropological points of view.

(CPCNH)

### Article 2

For the purposes of this Convention, the following shall be considered as "natural heritage": natural features consisting of physical and biological formations or groups of such formations, which are of outstanding universal value from the aesthetic or scientific point of view; geological and physiographical formations and precisely delineated areas which constitute the habitat of threatened species of animals and plants of outstanding universal value from the point of view of science or conservation; natural sites or precisely delineated areas of outstanding universal value from the point of view of science, conservation or natural beauty (CPCNH)

### Article 3

It is for each State Party to this Convention to identify and delineate the different properties situated on its territory mentioned in Articles 1 and 2 above (CPCNH)

## II National Protection and International Protection of the Cultural and Natural Heritage

### Article 4

Each state Party to this Convention recognizes that the duty of ensuring the identifications, protection, conservation, presentation and transmission to future generations of the cultural and natural heritage referred to in Article 1 and 2 and situated on its territory, belongs primarily to that State. It will do all it can to this end, to the utmost of its resources and where appropriate with any international assistance and co-operation, in particular, financial, artistic, scientific and technical, which it may be able to obtain. (CPCNH)

### Article 5

To ensure that effective and active measures are taken for the protection, conservation and presentation of the cultural and natural heritage situated on

its territory, each State Party to this Convention shall endeavour, in so far as possible, and as appropriate for each country:

- a) to adopt a general policy which aims to give the cultural and natural heritage a function in the life of the community and to integrate the protection of that heritage into comprehensive planning programmes; (CPCNH)
- b) to set up within its territories, where such services do not exist, one or more services for the protection, conservation and presentation of cultural and natural heritage with an appropriate staff and possessing the means to discharge their functions: (CPCNH)
- c) to develop scientific and technical studies and research and to work out such operating methods as will make the State capable of counteracting the dangers that threaten its cultural or natural heritage; and (CPCNH)
- d) to take the appropriate legal, scientific, technical, administrative and financial measures necessary for the identification, protection, conservation, presentation and rehabilitation of this heritage; and (CPCNH)
- e) to foster the establishment or development of national or regional centres for training in the protection, conservation and presentation of the cultural and natural heritage and to encourage scientific research in this field. (CPCNH)

#### Article 6

1. Whilst fully respecting the sovereignty of the States on whose territory the cultural and natural heritage mentioned in Articles 1 and 2 is situated, and without prejudice to property rights provided by national legislation, the States Parties to this Convention recognize that such heritage constitutes a world heritage for whose protection it is the duty of the international community as a whole to co-operate. (CPCNH)

2. The States parties undertake, in accordance with the provisions of this Convention, to give their help in the identification, protection, conservation and preservation of the cultural and natural heritage referred to in paragraphs 2 and 4 of Article 11 if the States on whose territory it is situated so request (CPCNH)

3. each State Party to this convention undertakes not to take any deliberate measures which might damage directly or indirectly the cultural and natural heritage referred to in Articles 1 and 2 situated on the territory of other States parties to this Convention (CPCNH)

#### Article 7

For the purpose of this Convention, international protection of the world cultural and natural heritage shall be understood to mean the establishment of a system of international co-operation and assistance designed to support States Parties to the Convention in their efforts to conserve and identify that heritage. (CPCNH)

### III Intergovernmental Committee for the Protection of the World Cultural and Natural Heritage

1. An intergovernmental Committee for the Protection of the Cultural and Natural Heritage of Outstanding Universal Value, called "the World Heritage Committee", is hereby established within UNESCO. It shall be composed of 15 States Parties to the Convention, elected; by States Parties to the Convention meeting in general assembly during the ordinary session of the General Conference of the UNESCO. the number of States members of the Committee shall be increased to 21 s from the date of the ordinary session of

the General Conference following the entry into force of this Convention for at least 40 states. (CPCNH)

2. Election of members of the Committee shall ensure an equitable representation of the different regions and cultures of the world. (CPCNH)

#### Article 11

1. Every State party to this Convention shall, in so far as possible, submit to the World Heritage Committee an inventory of property forming part of the cultural and natural heritage, situated in its territory and suitable for inclusion in the list provided for in paragraph 2 of this Article. This inventory, which shall not be considered exhaustive, shall include documentation about the location of the property in question and its significance. (CPCNH)

3. The inclusion of a property in the World Heritage List requires the consent of the State concerned. The inclusion of a property situated in a territory sovereignty or jurisdiction over which is claimed by more than one State shall in no way prejudice the rights of the parties to the dispute. (CPCNH)

4. The Committee shall establish, keep up to date and publish, whenever circumstances shall so require, under the title of "List of World Heritage in Danger", a list of the property appearing in the World Heritage list for the conservation of which major operations are necessary and for which assistance has been requested under this Convention. This list shall contain an estimate of the cost of such operations. The list may include only such property forming part of the cultural and natural heritage is threatened by serious and specific dangers, such as the threat of disappearance caused by accelerated deterioration, large-scale public or private projects or rapid urban or tourist development projects; destruction caused by changes in the use or ownership of the land; major alternations due to unknown causes; abandonment for any reason whatsoever; the outbreak or the threat of an armed conflict; calamities and cataclysms; serious fires, earthquakes, landslides; volcanic eruptions; changes in water level, floods, and tidal waves. The Committee may at any time, in case of urgent need, make a new entry in the List of World Heritage in Danger and publicize such an entry immediately. (CPCNH)

#### UN RESOLUTION 37/7 (1982)

##### THE WORLD CHARTER OF NATURE

The General Assembly,

**Reaffirming** the fundamental purposes of the United Nations, in particular the maintenance of international peace and security, the development of friendly relations among nations and the achievement of international co-operation in solving international problems of an economic, social, cultural, technical, intellectual or humanitarian character,

(WCN)

**Aware that:**

(a) {Mankind} is part of nature and life depends on the uninterrupted functioning of natural systems which ensure the supply of energy and nutrients (WCN)

(b) Civilization is rooted in nature, which has shaped human culture and influences all artistic and scientific achievement, and living in harmony with

nature gives man the best opportunities for the development of his creativity, and for rest and recreation, (WCN)

**Convinced that:**

(a) Every form of life is unique, warranting respect regardless of its worth to man, and to accord other organisms such recognition's, man must be guided by a moral code of action,

(b) Man can alter nature and exhaust natural resources by his action or its consequences and, therefore, must fully recognize the urgency of maintaining the stability and quality of nature and of conserving natural resources, (WCN)

**Persuaded that:**

(a) Lasting benefits from nature depend upon the maintenance of essential ecological processes and life support systems, and upon the diversity of life forms, which are jeopardized through excessive exploitation and habitat destruction by man (WCN)

(b) The degradation of natural systems owing to excessive consumption and misuse of natural resources as well as to failure to establish an appropriate economic order among peoples and among States, leads to the breakdown of the economic, social and political framework of civilization, (WCN)

(c) Competition for scarce resources creates conflicts, whereas the conservation of nature and natural resources contributes to justice and the maintenance of peace and cannot be achieved until mankind learns to live in peace and to forsake war and armaments, (WCN)

**Reaffirming** that man must acquire the knowledge to maintain and enhance his ability to use natural resources in a manner which ensures the preservation of the species and ecosystems for the benefit of present and future generations, (WCN)

**Firmly** convinced of the need for appropriate measures, at the national and international, individual and collective, and private and public levels, to protect nature and promote international co-operation in this field. (WCN)

**Adopts**, to these ends, the present World Charter for Nature, which proclaims the following principles of conservation by which all human conduct affecting nature is to be guided and judged. (WCN)

1. General Principles

1. Nature shall be respected and its essential processes shall not be impaired (WCN)

2. The genetic viability on the earth shall not be compromised: the population levels of all life forms, wild and domesticated, must be at least sufficient for their survival, and to this end necessary habitats shall be safeguarded (WCN)

3. all areas of the earth, both land and sea, shall be subject to these principles of conservation; special protection shall be given to unique areas, to representative samples of all the different types of ecosystems and to the habitats of rare or endangered species. (WCN)

4. Ecosystems and organisms, as well as the land, marine and atmospheric resources that are utilized by man, shall be managed to achieve and maintain optimum sustainable productivity, but not in such a way as to endanger the integrity of those other ecosystems or species with which they coexist. (WCN)

5. Nature shall be secured against degradation caused by warfare or other hostile activities. (WCN)

## II Functions

6. In the decision-making process it shall be recognized that man's needs can be met only by ensuring the proper functioning of natural systems and by respecting the principles set forth in the present Charter. (WCN)

7 In the planning and implementation of social and economic development activities, due account shall be taken of the fact that the conservation of nature is an integral part of those activities. (WCN)

8. In formulating long-term plans for economic development, population growth and the improvement of standards of living, due account shall be taken of the long-term capacity of natural systems to ensure the subsistence and settlement of the populations concerned, recognizing that this capacity may be enhanced through science and technology. (WCN)

9. The allocation of areas of the earth to various uses shall be planned and due account shall be taken of the physical constraints, the biological productivity and diversity and the natural beauty of the areas concerned. (WCN)

10. Natural resources shall not be wasted, but used with a restraint appropriate to the principles set forth in the present Charter, in accordance with the following rules: (WCN)

(a) Living resources shall not be utilized in excess of their natural capacity for regeneration; (WCN)

(b) The productivity of soils shall be maintained or enhanced through measures which safeguard their long-term fertility and the process of organic decomposition and prevent erosion and all other forms of degradation; (WCN)

(c) Resources, including water, which are not consumed as they are used shall be reused or recycled; (WCN)

(d) Non-renewable resources which are consumed as they are used shall be exploited with restraint, taking into account their abundance, the rational possibilities of converting them for consumption, and the compatibility of their exploitation with functioning of natural systems. (WCN)

11. Activities which might have an impact on nature shall be controlled, and the best available technologies that minimize significant risks to nature or other adverse effects shall be used; in particular, (WCN)

(a) activities which are likely to cause irreversible damage to nature shall be avoided; (WCN)

(b) Activities which are likely to pose a significant risk to nature shall be preceded by an exhaustive examination; their proponents shall demonstrate that expected benefits outweigh potential damage to nature, and where potential adverse effect are not fully understood, the activities should not proceed; (WCN)

(c) Activities which may disturb nature shall be preceded by assessment of their consequences, and environmental impact studies of development projects shall be conducted sufficiently in advance, and if they are to be undertaken, such activities shall be planned and carried out so as to minimize potential adverse effects; (WCN)

(d) Agriculture, grazing forestry and fisheries practices shall be adapted to the natural characteristics and constraints of given areas; (WCN)

(e) Areas degraded by human activities shall be rehabilitated for purposes in accord with their natural potential and compatible with the well-being of affected populations (WCN)

12. Discharge of pollutants into natural systems shall be avoided and: (WCN)

(a) Where this is not feasible, such pollutants shall be treated at the source, using the best practicable means available; (WCN)

(b) special precautions shall be taken to prevent discharge of radioactive or toxic wastes (WCN)

13. Measures intended to prevent, control or limit natural disasters, infestations and diseases shall be specifically directed to the causes of these scourges and shall avoid adverse side-effects on nature. (WCN)

### III Implementation

14. The principles set forth in the present Charter shall be reflected in the law and practice of each State, as well as at that international level. (WCN)

15. Knowledge of nature shall be broadly disseminated by all possible means, particularly by ecological education as an integral part of general education. (WCN)

16. All planning shall include, among its essential elements, the formulation of strategies for the conservation of nature, the establishment of inventories of ecosystems and assessments of the effects on nature of proposed policies and activities; all of these elements shall be disclosed to the public by appropriate means in time to permit effective consultation and participation. (WCN)

17. Funds, programmes and administrative structures necessary to achieve the objective of the conservation of nature shall be provided. (WCN)

18. constant efforts shall be made to increase knowledge of nature by scientific research and to disseminate such knowledge unimpeded by restrictions of any kind. (WCN)

19. The status of natural processes, ecosystems and species shall be closely monitored to enable early detection of degradation or threat, ensure timely intervention and facilitate the evaluation of conservation policies and methods. (WCN)

20. Military activities damaging to nature shall be avoided (WCN)

21. States and, to the extent they are able, other public authorities, international organizations, individuals, groups and corporations shall: (WCN)

(a) Co-operate in the task of conserving nature through common activities and other relevant actions, including information exchange and consultations; (WCN)

(b) Establish standards for products and manufacturing processes that may have adverse effects on nature, as well as agreed methodologies for assessing these effects; (WCN)

(c) Implement the applicable international legal provisions for the conservation of nature and the protection of the environment; (WCN)

(d) Ensure that activities within their jurisdiction or control do not cause damage to the natural systems located within other States or in the areas beyond the limit of national jurisdiction; (WCN)

(e) Safeguard and conserve nature in areas beyond national jurisdiction. (WCN)

22. Taking fully into account the sovereignty of States over their natural resources, each State shall give effect to the provisions of the present Charter through its competent organs and in co-operation with other States. (WCN)

23. All persons, in accordance with their national legislation, shall have the opportunity to participate, individually or with others, in the formulation of decisions of direct concern to their environment, and shall have access to means of redress when their environment has suffered damage or degradation. (WCN)

24. Each person has a duty to act in accordance with the provisions of the present Charter; acting individually, in association with others or through participation in the political process, each person shall strive to ensure that the objectives and requirements of the present Charter are met. (WCN)

**ASEAN AGREEMENT ON THE CONSERVATION OF NATURE AND NATURAL RESOURCES (KUALA LUMPUR, 1985) (Indonesia, Negara Brunei Darussalam, Malaysia, Philippine, Singapore and Thailand. (ASEAN) (ACNNR)**

excerpts from Agreement

...

Conscious also that the interrelationship between conservation and socio-economic development implies both that conservation is necessary to ensure sustainability of development, and that socio-economic development is necessary to the achievement of conservation on a lasting basis; (ACNNR)

Recognizing the interdependence of living resources, between them and with other natural resource, within ecosystems of which they are part; (ACNNR)

Wishing to undertake individual and joint action for the conservation and management of their living resources and the other natural elements on which they depend; (ACNNR)

Recognizing that international co-operation is essential to attain many of these goals (ACNNR)

; Convinced that an essential means to achieve such concerted action is the conclusion and implementation of an Agreement;

Chapter 1

Conservation and Development

Article 1

Fundamental Principle

1. The contracting Parties, within the framework of their respective national laws, undertake to adopt singly, or where necessary and appropriate through concerted action, the measures necessary to maintain essential ecological processes and life-support systems, to preserve genetic diversity, and to ensure the sustainable utilization of harvested natural resources under their jurisdiction in accordance with scientific principles and with a view to attaining the goal of sustainable development. (ACNNR)

2. To this end they shall develop national conservation strategies, and shall co-ordinate such strategies within the framework of a conservation strategies, and shall co-ordinate such strategies within the framework of a conservation strategy for the Region. (ACNNR)

## Article 2

### Development Planning

1. The Contracting Parties shall take all necessary measures, within the framework of their respective national laws, to ensure that conservation and management of natural resources are treated as an integral part of development planning at all stages and at all levels. (ACNNR)

2) to that effect that shall, in the formulation of all development plans, give as full considerations to ecological factors as to economic and social ones. (ACNNR)

3) The contracting Parties shall, where necessary, take appropriate action with a view to conserving and managing natural resources of significant importance for two or several Contracting Parties (ACNNR)

## chapter II

### Conservation of Species and Ecosystems

#### Article 3

##### Species — genetic diversity

1. The Contracting Parties shall, wherever possible, maintain maximum genetic diversity by taking action aimed at ensuring the survival and promoting the conservation of all species under their jurisdiction and control (ACNNR)

2. to that end, they shall adopt appropriate measures to conserve animal and plant species whether terrestrial, marine and freshwater, and more specifically (ACNNR)

a) conserve natural, terrestrial, freshwater and coastal or marine habitats; (ACNNR)

b) ensure sustainable use of harvested species; (ACNNR)

c) protect endangered species; (ACNNR)

d) conserve endemic species; and (ACNNR)

e) take all measures in their power to prevent the extinction of any species or subspecies. (ACNNR)

3. In order to fulfill the aims of the preceding paragraph of this Article the Contracting Parties shall, in particular endeavour to

a) create and maintain protected areas; (ACNNR)

b) regulate the taking of species and prohibit unselective taking methods; (ACNNR)

c) regulate and, where necessary, prohibit the introduction of exotic species; (ACNNR)

d) promote and establish gene banks and other documented collections of animal and plant genetic resources (ACNNR)

#### Article 4

##### Species — sustainable use

The Contracting Parties shall pay special attention to harvested species, and, to that effect, shall endeavour to (ACNNR)

1) develop, adopt and implement management plans for those species, based on scientific studies and aiming at (ACNNR)

a) preventing decrease in the size of any harvested population to levels below those which ensure its stable recruitment and the stable recruitment of those species which are dependent upon, or related to them; (ACNNR)

- b) maintaining the ecological relationship between harvested, dependent and related populations of living resources of the ecosystem considered; (ACNNR)
  - c) restoring depleted populations to at least the levels referred to in subparagraph (1) of this paragraph; (ACNNR)
  - d) preventing changes or minimizing risk of changes in the ecosystem considered which are not reversible over a reasonable period of time. (ACNNR)
2. Take the appropriate and necessary legislative and administrative measures on harvesting activities in the light of their national interest whereby (ACNNR)
- c) all indiscriminate means of taking and the use of all means capable of causing local extinction of, or serious disturbance to, populations of a species or related species are prohibited (ACNNR)
  - d) such activities are prohibited or strictly regulated at certain periods, seasons or places of importance in the life cycle of the species; (ACNNR)
  - e) such activities may be regulated more strictly, temporarily or locally in order to assist restoration of population levels or counterbalance any threat caused by special circumstances; (ACNNR)
  - f) special measures, such as restocking, are provided for whenever the conservation status of a species so warrants; (ACNNR)

#### Article 5

Species — endangered and endemic

#### Article 6

#### Vegetation Cover and Forest Resources

1. The Contracting Parties shall, in view of the role of vegetation and forest cover in the functioning of natural ecosystems, take all necessary measures to ensure the conservation of the vegetation cover and in particular of the forest cover on lands under their jurisdiction.
- b) regulate mining and mineral exploration operations with a view to minimizing (ACNNR) disturbance of vegetation and to requiring the rehabilitation of vegetation after such operations; (ACNNR)
  - c) set aside areas as forest reserve, *Inter alia*, with a view to conserve the natural forest genetic resources; (ACNNR)
  - d) in reforestation and afforestation planning avoid as far as possible monoculture causing ecological imbalance; (ACNNR)
  - e) designate areas whose primary function shall be the maintenance of soil quality in the catchment considered and the regulation of the quantity and quality of the water delivered from it; (ACNNR)
  - f) ensure, to the maximum extent possible the conservation of their natural forests, particularly mangroves with a view, *inter alia*, to maintaining maximum forest species diversity; (ACNNR)
  - g) develop their forestry management plans on the basis of ecological principles with a view to maintaining potential for optimum sustained yield and avoiding depletion of the resource capital. (ACNNR)

## Article 7

### Soil

1. The Contracting Parties shall, in view of the role in the functioning of natural ecosystems, take measures, wherever possible, towards soil conservation, improvement and rehabilitation; they shall, in particular, endeavour to take steps to prevent soil erosion and other forms of degradation, and promote measures which safeguard the processes of organic decomposition and thereby in continuing fertility (ACNNR)

2. To that effect, they shall, in particular, endeavour to

- a) establish land use policies aimed at avoiding losses of vegetation cover, substantial soil losses, and damages to the structure of the soil; (ACNNR)
- b) take all necessary measures to control erosion, especially as it may affect coastal or freshwater ecosystems, lead to siltation of downstream areas such as lakes or vulnerable ecosystems such as coral reefs, or damage critical habitats, in particular that of endangered or endemic species; ... (ACNNR)

## Article 8

### Water

1. The Contracting Parties shall, in view of the role of water in the functioning of natural ecosystems, take all appropriate measures towards the conservation of their underground and surface water resources. (ACNNR)

2. They shall to that effect, in particular, endeavour to

- a) undertake and promote the necessary hydrological research especially with a view to ascertaining the characteristics of each watershed; (ACNNR)
- b) regulate and control water utilization with a view to achieving sufficient and continuous supply of water for Inter alia, the maintenance of natural life supporting systems and aquatic fauna and flora; (ACNNR)
- c) when planning and carrying out water resource development projects take fully into account possible effects of such projects on natural processes or on other renewable natural resources and prevent or minimize such effects. (ACNNR)

## Article 9

### Air

The Contracting Parties shall, in view of the role of air in the functioning of natural ecosystems, endeavour to take all appropriate measures towards air quality management compatible with sustainable development. (ACNNR)

## Chapter III

### Conservation of Ecological Processes

#### Article 10

The Contracting Parties, with a view to maintaining the proper functioning of ecological processes, undertake, wherever possible, to prevent, reduce and control degradation of the natural environment and, to this end, shall endeavour to undertake, in addition to specific measures referred to in the following article; (ACNNR)

- a) to promote environmentally sound agricultural practice by, inter alia, controlling the application of pesticides, fertilizers and other chemical products for agricultural use, and by ensuring that agricultural development schemes, in particular for wetland drainage or forest clearance pay due regard to the

- need to protect critical habitats as well as endangered and economically important species; (ACNNR)
- b) to promote pollution control and the development of environmentally sound industrial process and products; (ACNNR)
- d) as far as possible to consider the originator of the activity which may lead to environmental degradation responsible for its prevention, reduction and control as well as, wherever possible, for rehabilitation and remedial measures required; (ACNNR)
- e) to take into consideration, when authorizing activities likely to affect the natural environment, the foreseeable interactions between the new activities proposed and those already taking place in the same area, and the result of such interactions on the air, waters, and soils of the area; (ACNNR)
- f) to pay particular attention to the regulation of activities which may have adverse effects on processes which are ecologically essential or on areas which are particularly important or sensitive from an ecological point of view, such as the breeding and feeding grounds of harvested species. (ACNNR)

#### Article 11

The contracting Parties, recognizing the adverse effect that polluting discharges or emissions may have on natural processes and the functioning of natural ecosystems as well as on each of the individual ecosystem components, especially animal and plants species, shall endeavour to prevent, reduce and control such discharges, emissions or applications, in particular by control such discharges, emissions or application, in particular by (ACNNR)

a) submitting activities likely to cause pollution of the air, soil, freshwater, or the marine environment, to controls which shall take into consideration both the cumulative effects of the pollutants concerned and the self-purification aptitude of the recipient natural environment; (ACNNR)

b) making such controls conditional on, inter alia appropriate treatment of polluting emissions; and (ACNNR)

c) establishing national environmental quality monitoring programmes particular attention being paid to the effects of pollution on natural ecosystems, and co-operation in such programmes for the Region as a whole. (ACNNR)

#### Chapter IV

1. The Contracting Parties shall wherever possible in the implementation of their development planning, give particular attention to the national allocation of land usage. They shall endeavour to take the necessary measures to ensure the integration of natural resource conservation into the land use planning process and shall, in the preparation and implementation of specific land use plans at all levels, give as full consideration as possible to ecological factors as to economic and social ones, in order to achieve optimum sustainable land use; they undertake to base their land use plans as far as possible on the ecological capacity of the land. (ACNNR)
3. They shall, where appropriate, coordinate their land use planning with a view to conserving and managing natural resources of significant importance for two or several Contracting Parties. (ACNNR)

## Article 13

### Protected Areas

1. The Contracting Parties shall, as appropriate, establish, in areas under their jurisdiction, terrestrial, freshwater, coastal or marine protection areas for the purpose of safeguarding

- the ecological and biological processes essential to the functioning of the ecosystems of the Region; (ACNNR)
- representative samples of all types of ecosystems of the Region; (ACNNR)
- satisfactory population levels for the largest possible number of species of fauna and flora belonging to those ecosystems; (ACNNR)
- areas of particular importance because of their scientific, educational, aesthetic, or cultural interest; and taking into account their importance in particular as: (ACNNR)
  - the natural habitat of species of fauna and flora, particularly rare or endangered or endemic species; (ACNNR)
  - zones necessary for the maintenance of exploitable stock of economically important species; (ACNNR)
  - pools of genetic material and safe refuges for species, especially endangered ones; (ACNNR)
  - sites of ecological, aesthetic or cultural interest; (ACNNR)
  - reference sources for scientific research; (ACNNR)
  - areas for environmental education (ACNNR)

They shall, in particular, take all measures possible in their power to preserve those areas which are of an exceptional character and are peculiar to their country or the Region as well as those which constitute the critical habitats of endangered or rare species, of species that are endemic to a small area and of species that migrate between countries of Contracting Parties. (ACNNR)

2. Protected areas established pursuant to this Agreement shall be regulated and managed in such a way as to further the objectives for the purpose of which they have been created. Contracting Parties shall, wherever possible, prohibit within such protected areas activities which are inconsistent with such objectives. (ACNNR)

3. Protected areas shall include

#### a) National Parks (ACNNR)

- i. This expression denotes natural areas that are sufficiently large to allow for ecological self-regulation of one or several ecosystems, and which have not been substantially altered by human occupation or exploitation (ACNNR)
- ii National Parks shall be placed under public control, their boundaries shall not be altered nor shall any portion of any National Park be alienated except by the highest competent authority. (ACNNR)
- iii. National Parks shall be dedicated to conservation and to scientific, educational and recreational uses and the common welfare of people. (ACNNR)

#### b) Reserves

- i) This expression denotes areas set aside for the purpose of preserving a specific ecosystem, the critical habitat of certain species of fauna or flora, a water catchment area or for any other specific purpose relating to the

conservation of natural resources or objects or areas of scientific, aesthetic, cultural, education or recreational interest. (ACNNR)

iii Reserves shall be dedicated to the purposes for which they have been created and, in the light of the national interests of the Contracting Parties, any activity inconsistent with such purposes shall be prohibited. (ACNNR)

4. Contracting Parties shall, in respect of any protected area established pursuant to this Agreement (ACNNR)

a) prepare a management plan and manage the area on the basis on this plan; (ACNNR)

b) establish, wherever appropriate, terrestrial or aquatic buffer zones that shall be located around protected areas and which, in the case of marine areas, may include coastal land areas or watersheds of rivers flowing into the protected area; in such buffer zones all activities that may have harmful consequences on the ecosystems that such areas purport to protect shall be prohibited or regulated and activities which are consistent with the purpose of the protected area shall be promoted. (ACNNR)

5. Contracting Parties shall, in respect of any protected area established pursuant to this agreement, endeavour to (ACNNR)

a) prohibit the introduction of exotic animal or plant species; (ACNNR)

b) prohibit the use or release of toxic substances or pollutant which could cause disturbance or damage to protected ecosystems or to the species they contain; (ACNNR)

c) to the maximum extent possible, prohibit or control any activity exercised outside protected areas when such an activity is likely to cause disturbance or damage to the ecosystems or species that such protected areas purport to protect (ACNNR)

6. Contracting Parties shall co-operate in the development of principles, objectives, criteria and guidelines for the selection, establishment and management of protected areas in the Region with a view to establishing a co-ordinated network of protected areas throughout the Region, giving particular attention to those of regional importance. An Appendix containing such principles, objectives, criteria and guidelines shall be drawn up in the light of the best scientific evidence as adapted to the conservation requirements of the Region and shall be adopted by a meeting of Contracting Parties. (ACNNR)

In addition to the establishment of the protected areas referred to in paragraph 3 of this Article, Contracting Parties shall promote, through the adoption of appropriate measures, the conservation of natural areas by private owners, community or local authorities. (ACNNR)

## Article 14

### Impact Assessment

1. The Contracting Parties undertake that proposals for any activity which may significantly affect the natural environment shall as far as possible be subjected to an assessment of their consequences before they are adopted, and they shall take into consideration the results of this assessment in their decision-making process. (ACNNR)

2. In those cases where any such activities are undertaken, the Contracting Parties shall plan and carry them out so as to overcome or minimize any

assessed adverse effects and shall monitor such effects with a view to taking remedial action as appropriate. (ACNNR)

## Chapter 5

### National Supporting Measures

#### Article 15

#### Scientific Research

#### Article 16

#### Education, Information, and Participation of the Public, Training

1. the Contracting Parties shall endeavour to promote adequate coverage of conservation and management of natural resources in education programmes at all levels (ACNNR)

2. They shall circulate as widely as possible information on the significance of conservation measures and their relationship with sustainable development objectives and shall, as far as possible, organize participation of the public in the planning and implementation of conservation measures. ... (ACNNR)

#### Co-operative Activities

#### Article 19

#### Shared Resources

c) as far as possible, make environmental assessments prior to engaging in activities with respect of shared natural resources which may create a risk of significantly affecting the environment of another sharing Contracting Party or the sharing Contracting Parties;

d) notify in advance the other sharing Contracting Party or the other sharing Contracting Parties of pertinent details of plans to initiate, or make a change in, the conservation or utilization of the resource which can reasonably be expected to affect significantly the environment in the territory of the other Contracting Party or Contracting Parties; (ACNNR)

...

#### Article 20

#### Trans frontier Environmental Effects

1. Contracting Parties have in accordance with generally accepted principles of international law the responsibility of ensuring that activities under their jurisdiction or control do not cause damage to the environment or the natural resources under the jurisdiction of other Contracting Parties or of areas beyond the limits of national jurisdiction. (ACNNR)

2. In order to fulfill this responsibility, Contracting Parties shall avoid to the maximum extent possible and reduce to the minimum extent possible adverse environmental effects of activities under their jurisdiction or control, including effects on natural resources, beyond the limits of their national jurisdiction. (ACNNR)

3. To that effect, they shall endeavour

a) to make environmental impact assessment before engaging in any activity that may create a risk of significantly affecting the environment or the natural

resources of another Contracting Party or the environment or natural resources beyond jurisdiction; (ACNNR)

4. Contracting Parties shall, in particular, endeavour to refrain from actions which might directly or indirectly adversely affect wildlife habitats situated beyond the limits of national jurisdiction, especially habitats of species listed in Appendix 1 or habitats included in protected areas. (ACNNR)

## Chapter VII

### International Supporting Measures

#### Article 21

#### Meeting of the Contracting Parties

#### Article 22-35 Administration of Agreement

As we, in BC Parks and BC Forest Service begin to work on implementing our components of B.C.'s protected areas under the aegis of the Commission on Resources and Environment, we will be mindful of this Declaration [the Caracas Declaration: Parks Protected Areas and the Human Future] and its implications. Our objective will be to have a system of protected areas which we are proud to present to the world.

Through this declaration the Provincial government has recognized that

- nature has intrinsic worth and warrants respect regardless of its usefulness to humanity
- this natural wealth is being eroded at an unprecedented rate, because of the rapid growth in human numbers, the uneven and often excessive consumption of natural resources, mistaken and socially harmful styles of development, global pollution and defective economic regimes, so that the future of humanity is now threatened;
- many people must modify their styles of living and the world community must adopt new and equitable styles of development, based on the care and sustainable use of the environment, and the safeguarding of global life-supporting systems (CD)

ACCORDINGLY, and bearing in mind the message of *Caring for the Earth: A strategy for Sustainable Living*, *The Global Biodiversity Strategy*, launched at this Congress, and the earlier messages of the World Conservation Strategy, the World Charter for Nature and the World Commission on Environment and Development, WE, the

## The U

### 3.2. Conserving Biodiversity

The congress urgently requested that all countries urgently undertake surveys to identify additional sites of critical importance for conservation of biological diversity, and wherever possible, accord total protection to them. Harvesting

should be relocated from primary to secondary forests and tree plantations in previously deforested areas; or - where this is not possible - sustainable forest harvesting systems which favour natural species diversity should be developed and introduced. p 8

### 3.3. Conservation on a regional scale

Protected areas have sometimes been seen as islands of nature and tranquility, surrounded by incompatible land uses. But the congress made it clear that such an "island mentality" is fatal in the long run. The congress recognized that it is unlikely that protected areas will be able to conserve biodiversity if they are surrounded by degraded habitats that limit gene-flow alter nutrient and water cycles and produce regional and global climate change that may lead to the final disappearance of these "island parks." Protected areas, therefore need to be part of broader regional approaches to land management. The term bioregion was used to describe extensive areas of land and water which include protected areas and surrounding lands, preferably including complete watersheds, where all agencies and interested parties have agreed to collaborative management.

#### recommendation 3

Global efforts to conserve biological diversity.

"The loss of biodiversity has reached crisis proportion and if present trends continue up to 25 % of the world's species may be sentenced to extinction or suffer severe genetic depletion in the next several decades, accompanied by equally significant and alarming degradation of habitats and ecosystems. This loss of biological diversity is impoverishing the world of its genetic resources, its species, habitats and ecosystems.

All species deserve respect, regardless of their usefulness to humanity. This Principle was endorsed by the UN Assembly when it adopted the World Charter for nature in 1982. The loss of the living richness of the planet is dangerous, because of the environmental systems of the world support all life, and we do not know which are the key components in maintaining their essential functions.

the It World Congress on national Parks and Protected Areas recommends that:

- a) governments make the protection of biological diversity, including species and habitat richness, representativeness and scarcity, a fundamental principle for the identification, establishment, management and public enjoyment of national parks and other protected areas;
- b) all countries urgently undertake surveys to identify additional sites of critical importance for conservation of biological diversity and wherever possible, accord total protection to them Harvesting should be relocated from primary to secondary forests and tree plantations in previous deforested areas; or — where this is not possible — sustainable forest harvesting systems which favour natural species diversity should be developed and introduced: p. 30

Recommendation 4:  
Entitled legal regimes for protected areas.

Protected areas require a mutually reinforcing system of international and national environmental law for their establishment, maintenance and management. International treaties establish a harmonized set of obligations with regard to areas within national jurisdictions and activities having effect beyond national jurisdictional boundaries. These obligations must be reflected in national legislation; otherwise, the treaties cannot be implemented. In turn, innovative national legislation provides a basis and impetus for further international law. The dynamic interaction between the two levels is thus conducive to further progress. p. 31

( ) **THAT** in Dec 26, 1993 I circulated a piece criticizing Premier Mike Harcourt's proposal for the Keyano Completion Project

#### EXHIBIT

1993 DEC 26 to the Editor

Premier Harcourt's Kemano Completion Farical Review: mitigation rather than precaution

The Canadian government has refused to undertake an environmental assessment review of the Kemano Completion Project , even though the Canadian government has made an international commitment "to ensure that decisions [about projects] are preceded by environmental impact assessments" and "to take into account the costs of any ecological consequences (Agenda 21,7.42). Canadian Law has also committed the Canadian government "to carry out an environmental assessment review to determine if the potentially adverse environmental effect that may be caused by a proposal are significant (S.12, EARP).

The Canadian government has also refused to assess the environmental and cultural impacts of the Kemano Completion project on native communities, even though the Canadian government has made an international commitment to indigenous people " to recognize that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate" {Agenda 21, 16.3 a (ii)}.

On January 19,1993, Premier Harcourt issued a press release " Premier Announces Review of Kemano Completion Project." Premier Harcourt's statement was misleading because he did not make a distinction between a "precautionary" and a "mitigative" review. A precautionary review is one that attempts to prevent environmental degradation and cultural inappropriateness of a project by examining the potential environmental and cultural impacts of a project to determine whether the project should be allowed to proceed; the outcome of a precautionary review could be a decision to prevent the project from proceeding. A mitigative review, however, is one that attempts to lessen the environmental degradation and cultural inappropriateness of a project which has already been permitted to proceed;

the outcome of a mitigative review would not be a decision to prevent the project from proceeding.

The terms of reference of the proposed B.C. government's public review of Kemano Completion Project are *not* to determine whether the project should proceed but to assess the options for mitigating impacts associated with the Project." There is a significant distinction between undertaking to carry out an environmental assessment review of the Kemano Completion Project to determine if the project should proceed, and undertaking a "public review" of the impact of the Kemano Completion project after the decision has been made to allow the project to proceed.

The Cheslatta Carrier nation, displaced by the Kemano I Project, is advocating a review that, if carried out, would probably fully justify immediate mitigation of the impacts of the Kemano I project, and justify the prevention of the Kemano Completion Project. In their proposed review, the terms of reference should include but not be limited to the following:

- a thorough investigation into all environmental, economic, social and cultural impacts of Kemano 1, and prescribe immediate mitigation;
- a thorough review of the terms, conditions and circumstances surrounding the granting of Alcan's 1950 Nechako Water licence including a thorough review of the 1949 water licence 'hearings' held at Wistaria and Victoria
- a thorough review of the 1987 Nechako settlement Agreement, including into terms and conditions and 'mitigative' measures, and the circumstances that led to this settlement
- a full disclosure of all federal and provincial documents and involvement relating to the Kemano projects;
- the commissioning of an independent cost/benefit analysis of the Kemano projects;
- the commissioning of an independent environmental impact assessment of Kemano 2;
- a throughout investigation into possible violations of the Federal Fisheries Act and the provincial Water Act;
- a thorough investigation into power sale contracts between Alcan and B.C. Hydro;
- an investigation into whether Alcan is a 'public utility';
- a thorough investigation into the impact of the reduced water flows on the Nechako River on the concentration of municipal agricultural and industrial effluent;
- a thorough investigation into the past and present management of the Nechako Watershed;
- a thorough investigation of Environcon Ltd and Triton Environmental Consultants Ltd. (April 1993, Cheslatta Nation )

If the proposed Cheslatta review were carried out it could result in the restoration of the environmental degradation of Kemano I, and in the redress for the cultural impacts of Kemano 1. Their review could also result in the prevention of the Kemano Completion Project. As pointed out by the Cheslatta band the cost of compensation for any loss that Alcan may have incurred for its preparatory work for Kemano Completion will be far less than the cost of past (Kemano I) and future (Kemano Completion Projects) environmental degradation and cultural displacement. Any public review that does not fully investigate the impact of Kemano I, and does not have within

the terms of reference the possibility of preventing the Kemano Completion Project from proceeding is making a mockery of the precautionary principle and of the public process.

Joan Russow  
ERA Ecological Rights Association

The Canadian and B.C. governments are prepared to permit and condone activities by Alcan that are deemed, by the affected native communities, to be both environmentally unsound and culturally inappropriate.

“...follows a decision to allow a project to proceed, and thus is limited to attempting to determine not whether the project should be allowed to proceed but rather the best way of adjusting to the inevitable environmental degradation occurring as a result of allowing the project to proceed.

Prevention-to-avoid-subsequent-measures-to-rehabilitate principle

A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate, treat and develop new water supplies.

“(Agenda 21, 18.45)

Assessment-of-direct-and-indirect-costs principle

“ Human health and environmental quality are undergoing continuous degradation by the increasing amount of hazardous wastes being produced. there are increasing direct and indirect costs to society and to individual citizens in connection with the generation, handling and disposal of such wastes. “ (Agenda 21, 20.9)

“Unsustainable patterns of production and consumption are increasing the quantities and variety of environmentally persistent wastes at unprecedented rates. The trend could significantly increase the quantities of wastes produced by the end of the century and increase quantities four to fivefold by the year 2025”. (Agenda 21, 21.7)

“Many of these problems have arisen from a development model that is environmental destructive and from a lack of protection. Ecological and human health effects are the measurable consequences... although the means to monitor them are inadequate or non-existent in many countries. There is a widespread lack of perception of the linkages between the development, management use and treatment of water resources and aquatic ecosystems.” (Agenda 21, 18.45)

“...to promote patterns of consumption and production that reduce environmental stress and will meet the basic needs of humanity” (Agenda 21, 4.7.a)

"Governments at the appropriate level, with the assistance of international and regional organizations, academic and scientific institutions and the pharmaceutical industry, should taking into account appropriate safety and ethical considerations” (Agenda 21, 16.14)

" Apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it”; (Agenda 21, 17.23 a)

" a precautionary and anticipatory rather than a reactive approach is necessary to prevent the degradation of the marine environment.

Anticipatory-and-life-cycle-approach principle

"Consider adopting policies based on accepted producer liability principles, where appropriate, as well as precautionary, anticipatory and life-cycle

approaches to chemical management, covering manufacturing, trade, transport, use and disposal ”  
(Agenda 21, 19.50 a)

Concept-of-environmental-care principle...

“Empower community groups, non-governmental organizations and individuals to assume the authority and responsibility for managing and enhancing their immediate environment through participatory tools, techniques and approaches embodied in the concept of environmental care. ”  
(Agenda 21, 7.21. g)

Lead-to-be-taken-by-government-to-establish environmental assessment principle

“Governments should take the lead in establishing and strengthening, as appropriate, national procedures for environmental impact assessment, taking into account the cradle-to-grave approach to the management of hazardous wastes, in order to identify options for minimizing the generation of hazardous wastes, through safer handling, storage, disposal and destruction” (Agenda 21, 20.20 e)

Environmental-impact-assessment principle

" Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the assessment of the impacts of relevant policies and programmes on biological diversity” (Agenda 21, 15.5 k)

Root-cause-change principle

" Environmentally sound waste management must go beyond the mere safe disposal or recovery of wastes that are generated and seek to address the root cause of the problem by attempting to change unsustainable patterns of production and consumption.” (Agenda 21,21.4)

### **The Kemano Farcical Review: reaction rather than precaution**

Public environmental reviews can be precautionary (anticipatory) or reactive. A precautionary environmental assessment review is one that attempts to prevent environmental degradation by examining the environmental implications of a project before allowing the project to proceed. The outcome of a precautionary environmental assessment review could be a decision would to not permit the project to proceed. A reactive environmental assessment review, however, is one that follows a decision to allow a project to proceed, and thus is limited to attempting to determine not whether the project should be allow to proceed but rather the best way of adjusting to the inevitable environmental degradation occurring as a result of allowing the project to proceed. There is a significant distinction between undertaking to carry out an environmental Assessment review of the Kemano 11 project to determine if the project should proceed; and undertaking a "public review" of the impact of the Kemano Completion Project after the decision has been made to allow the project to proceed.

The Canadian government has refused to undertake a review of the Kemano Completion project, even though the Canadian government has made an international commitment to

"ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences (Agenda 21,7.42), and national commitments to "carry out environmental assessment review to determine if the potentially adverse environmental effect that may be caused by the proposal are significant (Section 12, Environmental Assessment Review Program- EARP), and to "take both prevent[at]ive and remedial measures in protecting the environment, "(section 2,Canadian Environmental Protection Act, 1988d).

The British Columbia government is now undertaking to carry out a "reactive" not a "precautionary" review of the Kemano completion project: a "public review of the Kemano Completion Project." The terms of reference of this public review are not to determine whether the project should proceed but to assess the options for addressing impacts associated with the Project." The government through its Cabinet Planning Secretariat has been contacting groups to invite "qualified applicants" to participate in the public review of the Kemano Completion Project.

In the terms of reference for this review, the British Columbia government "may review issues related to ...aboriginal issues." In 1992, the Canadian and B.C. governments made an international commitment to the indigenous people

" To recognize that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate" (Agenda 21, 16.3 a (ii))

Yet in the Kemano Completion project both the Canadian and B.C. governments are prepared to permit and condone Alcan's activities that are environmentally unsound and that are deemed by the affected native communities to be both environmentally unsound and culturally inappropriate.

To fulfill this international commitment to indigenous people there must be a precautionary not just a reactive review.

The Cheslata Carrier nation, displaced by the Kemano I project is calling for the "Scope of an Environmental Review" to include but not to be limited to the following:

- a thorough investigation into all environmental, economic, social and cultural impacts of Kemano 1, and prescribe immediate mitigation;
- a thorough review of the terms, conditions and circumstances surrounding the granting of Alcan's 1950 Nechako Water licence including a thorough review of the 1949 water licence 'hearings' held at Wistaria and Victoria
- a thorough review of the 1987 Nechako settlement Agreement, including into terms and conditions and 'mitigative' measures, and the circumstances that led to this settlement
- a full disclosure of all federal and provincial documents and involvement relating to the Kemano projects;
- the commissioning of an independent cost/benefit analysis of the Kemano projects;
- the commissioning of an independent environmental impact assessment of Kemano 2;
- a throughout investigation into possible violations of the Federal Fisheries Act and the provincial Water Act;

- a thorough investigation into power sale contracts between Alcan and B.C. Hydro;
- an investigation into whether Alcan is a 'public utility';
- a thorough investigation into the impact of the reduced water flows on the Nechako River on the concentration of municipal agricultural and industrial effluent;
- a thorough investigation into the past and present management of the Nechako Watershed;
- a thorough investigation of Environcon Ltd and Triton Environmental Consultants Ltd. (April 1993, Cheslatta Nation )

If the proposed Cheslatta Environmental review were carried out it could result in the restoration of the environmental impacts of Kemano 1 and the prevention of the Kemano completion project. As pointed out by the Cheslatta band the cost of compensation for any loss that Alcan may have incurred for its preparatory work for Kemano completion project will be far less than the future environmental and cultural costs. Any review that does not fully investigate the impact of Kemano I, and does not have within the terms of reference the possibility of not permitting the project from proceeding is delusion of public process.

completion project. or mitigative. Preventive environmental reviews

An environmental assessment of the project has not been carried out in defiance of international, national and provincial law. In international law Canada has made a commitment to; in national law Canada has made a commitment to

Both the Canadian and B.C. governments made a commitment at UNCED to Environmental assessment review:

“Nationally Canada has made a commitment or section 13. notwithstanding the determination concerning a proposal made if public concern about the proposal is such that a public review is desirable, the initiating department shall refer the proposal to the Ministry for public review by a panel.” (EARP Guidelines)

“The duty of the Federal Government is that it shall (a) take both preventive and remedial measures in protecting the environment”, (section 2, Canadian Environmental Protection Act, 1988d).

The Canadian Government and the B.C. Government have in defiance of international, national and provincial commitments permitted the Kemano II project to proceed. To appease the public they set up what they refer to as the "public review of the Kemano Completion project." The terms of reference of this public review have already been established, and those that want to apply for funding have to indicate "how their objective related to the Terms of Reference"

At a time when international documents are calling for "precaution," anticipatory measures," "cradle to grave approach" and "culture of safety," Canada and B.C. allow a questionable project to proceed and wait until the potential damage occurs and then doing nothing more than undertaking remedial measures after the fact. If there "public review" determines that there will be harm to

At a time when international community is calling for a full life cycle analysis of substances and activities, Canada and B.C. is allowing ALCAN to proceed with the completion without having carried out an environmental assessment of Kemano I. In the B.C. Environment report dated February 12, 1993, Alcan was on the list for the sixth time for continuing to discharge high levels of fluorides and cyanides into the Kitimat Arm.

The public review envisioned by the government is one that must woo Alcan to participate. In a letter, dated March 4, 1993, the Vice President for British Columbia Alcan wrote that

"Alcan has advised the Provincial Government that it requires clarification of the Government's intentions with respect to the performance of its obligations under the settlement Agreement dated September 14, 1987 between Alcan, Canada and the Province before Alcan will voluntarily participate in, or cooperate with, any public review of the project. Those assurances have not yet been provided. In the absence of these assurances, Alcan will not provide the information you requested nor will it participate in whatever process you decide to initiate. If Alcan's position changes by reason of having received appropriate assurances from the Government, I will let you know"

What might these assurances be, Does this sound like a company that will submit itself to a full environmental assessment review.

On October 30, 1991, in passing orders in council which permitted the continuation of nuclear warship visits, the federal government bypassed the following requirements for an environmental assessment:

Section 12 every initiating department shall screen or assess each proposal for which it is the decision-making authority to determine if ... e) the potentially adverse environmental effect that may be caused by the proposal are significant. (EARP Guidelines)

Section 33. 1 of the Fisheries Act states the following:

"Every person who carries on or proposes to carry on any work or undertaking that results or is likely to result in

a) the deposit of a deleterious substance in water frequented by fish or in any place under any conditions where that deleterious substance or any other deleterious substance that results from the deposit of that deleterious substance may enter any such water, or

b) the alteration, disruption or destruction of fish habitat

shall on the request of the Minister... (a) provide the Minister with such plans, specifications, studies, procedures, schedules, analyses, samples or other information relating to the work or undertaking and with such analyses, samples, evaluations, studies or other information relating to the water, place or fish habitat that is or is likely to be affected by the work or undertaking as will enable the Minister to determine

c) whether there is or is likely to be a deposit of a deleterious substance by reason...d) whether the work or undertaking results or is likely to result in any alternation, disruption or destruction of fish habitat.”(Federal Fisheries, 1977, C. 35)

d) “The duty of the Federal Government is that it shall (a) take both preventative and remedial measures in protecting the environment,” (section 2, Canadian Environmental Protection Act, 1988, C 22).

In section 5 Department of the Environment Act

The Minister in exercising his powers and carrying out his duties and functions under section 4 shall...

5(ii) to ensure that new federal projects, programs and activities are assessed early in the planning process for potential adverse effects on the quality of the natural environment and that a further review is carried out of those projects, programs, and activities that are found to have probable significant adverse effects and the results thereof taken into account, and  
.....

#### UNCED Documents Sections from Agenda 21

“Indigenous people and their communities have an historical relationship with their lands and are generally descendants of the original inhabitants of such lands. In the context of this chapter the term "lands" is understood to include the environment of the areas which the people concerned traditionally occupy. Indigenous people and their communities represent a significant percentage of the global population. They have developed over many generations a holistic traditional scientific knowledge of their lands, natural resources and environment. Indigenous people and their communities shall enjoy the full measure of human rights and fundamental freedoms without hindrance or discrimination. Their ability to participate fully in sustainable development practices on their lands has tended to be limited as a result of factors of an economic, social and historical nature. In view of the interrelationship between the natural environment and its sustainable development and the cultural, social, economic and physical well-being of indigenous people, national and international efforts to implement environmentally sound and sustainable development should recognize, accommodate, promote and strengthen the role of indigenous people and their communities.” (Agenda 21, 16.1)

In full partnership with indigenous people and their communities, Governments and, where appropriate, intergovernmental organizations should aim at fulfilling the following objectives: (Agenda 21, 16.3)

(a) Establishment of a process to empower indigenous people and their communities through measures that include:

- (i) Adoption or strengthening of appropriate policies and/or legal instruments at the national level;

To the editor

The public should be presented with the real alternatives

Often intact ecosystems that have been deserving of preservation or sensitive environmental areas that are worthy of protection have been irreversibly destroyed because it was deemed necessary for governments to pay compensation. In the past, compensation has been assessed purely from an economic basis without taking into consideration the true environmental costs. In order to assess the environmental costs of the destruction of significant ecosystems and sensitive environmental areas one may need to examine the nature and extent of accumulated anthropogenic activity over time. Over the years governments have entered into contracts, such as tree farm licensees, or industrial development permits, and as a result of either non-existent environmental protection or non-compliance/enforcement of current statutes and regulations, irreversible environmental damage has occurred.

In the past environmental damage was considered to be "collateral damage," a natural, inevitable and acceptable outcome of industrial growth. Now, there is the current acknowledgement by all levels of government of the importance of addressing environmental degradation. The Federal Government has made an international commitment at Rio to comply with the following principles which require 1. the carrying out of environmental impact assessment; 2. protecting of indigenous people from environmentally unsound, or socially or culturally inappropriate; 3. introducing the polluter-pay principle; 4. the undertaking of the life cycle analysis.

"Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences" (Agenda 21,7.42)

"Introduce appropriate environmental impact assessment procedures for proposed projects likely to have significant impacts upon biological diversity... and encourage the assessment of the impacts of relevant policies and programmes on biological diversity" (Agenda 21, 15.5 k)

"Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate; recommendations" (Agenda 21, 16.3 ii)

Governments should include in national planning and legislation an integrated approach to environmental protection, driven by prevention and source reduction criteria, taking into account the 'polluter pays' principle... (Agenda 21,20.20 b)

"...consider adopting policies based on accepted producer liability principles, where appropriate, as well as precautionary, anticipatory and life-cycle

approaches to chemical management, covering manufacturing, trade, transport, use and disposal" (Agenda 21, 19.50 a)

If Canada were to comply with these principles, Canada would require an environmental impact assessment of industries and industrial practices that could have an impact on the environment, or on the conservation of biodiversity; the cessation of any activity that could have the above impacts on the indigenous community; the revealing of the full environmental impacts of a project, and the assessment of the full environmental costs so as to require the polluter to pay. Compliance with this principle could bring about the environmental assessment of industrial activities such as construction of dams for the generating of electricity.

The Federal government has the new Environmental Assessment Review Act in place, and the fisheries act is still in place; the British Columbia government is formulating its new Environmental assessment Act. Yet for some reason the Alcan's Kemano project is able to proceed without an environmental assessment review, either from the Federal or the Provincial government.

It appears that Murray Rankin, the government lawyer was requested to write a report outlining the government's legal alternatives

Prime Minister in his speech... reported on the two alternatives presented in the report These alternatives appear to be:

1. to continue with the project and carry out an environmental assessment review on the damage that will continue to occur to the ecosystem and to the communities
2. to cancel the project, and pay 100 million to Alcan for compensation

There was however, a third alternative that was suggested in Murray Rankin's report and that was to go back to the original agreement

This third alternative was not neither recommended by the lawyer, nor reported as being a possibility by Harcourt. It was feared that there could be international economic repercussions for contract

The government by selecting the first alternative is making the traditional "compensation-avoidance" based decision rather than a principled decision. If the government chose option 2, the government after carrying out a true environmental assessment not just of what potential environmental damage could be caused in the future if the project proceeded, but of the cost of the environmental damage that has already ensured because of the practices of extracting aluminum; then the government would realize that the environmental cost of the environmental degradation and human displacement caused by the Alcan's production over the years would far outweigh any compensation claimed by the company. If the government opted for the third alternative, then although, often the companies that have contributed in the past to the destruction of significant ecosystems may not be the current holders of the specific tree farm licence in the area containing the significant ecosystem, most of the companies are still functioning in British Columbia. This investigation of the environmental costs would involve the

whole province so that there would need to be a global assessment of environmental costs incurred by the companies, not a valley-to-valley assessment.

Both the Federal and Provincial government by continuing with the Kemano project without carrying out an environmental assessment review, and by not acknowledging the true environmental costs of the degradation caused by Alcan, by ignoring the harm that has occurred and continues to occur to the native people, and by failing to reveal the full life cycle impact on the environment of the production of aluminum.

“As stewards of a vast and beautiful land, and as a people intimately connected to the environment, Canadians are aware of their environmental responsibilities.” (Canada’s National Report, Preface)

And further the section on the "quality of life", the Canadian government stated

“As a small population with a large land mass, Canadians have access to relatively unspoiled wilderness areas rich in wildlife ... Canada has an international reputation as a beautiful, safe and mostly unspoiled country.” (Canada's National Report, p.49)

If we continue to give the impression to the global community that we are concerned about the environment, then we should immediately act to live up to our international commitments whether or not they are or are not yet legally binding.

## PRINCIPLES DRAWN FROM INTERNATIONAL DOCUMENTS

### 1. Prior-assessment-in-decision-making-principle

“Ensure that relevant decisions are preceded by environmental impact assessments and also take into account the costs of any ecological consequences” (Agenda 21,7.42)

### 2. Positive-duty-to protect-indigenous lands principle

“Recognition that the lands of indigenous people and their communities should be protected from activities that are environmentally unsound or that the indigenous people concerned consider to be socially and culturally inappropriate; recommendations” (Agenda 21, 16.3 ii)

### 3. Precautionary principle

"Where there are threats of serious or irreversible damage, lack of full scientific certainty shall not be used as a reason for postponing cost-effective measures to prevent environmental degradation." (Rio Declaration, 1992).

"If Canada were to comply with this principle, then all threats of serious irreversible damage would cease or be mitigated. Compliance with this principle could mean that Canada shall cease logging in catchment areas from where communities derive their water. No longer would representatives from resource ministries be able to claim, "there is no scientific certainty that logging will cause harm, therefore we can log the catchment area."  
(Paraphrase of remark by Cuthbert from the Ministry of Forests)

### 4. Recognition of non-damaging use value principle

"The implications of the harvesting of forest resources for the other values of the forest should be taken fully into consideration in the development of forest policies. It is also possible to increase the value of forests through non-damaging uses such as ecotourism and the managed supply of genetic materials. Concerted action is needed in order to increase people's perception of the value of forests and of the benefits they provide." (Agenda 21, 11.22)

If Canada were to comply with this principle, it would give serious consideration to the economic value of non-damaging use prior to destroying this significant alternative. Compliance with this principle could mean that the courts could look unfavorably on those who claim that "irreparable harm " could be construed as loss of "damaging-use" jobs. Damaging use could then be perceived as bringing about not only irreparable harm but also a " loss of ecologically sound employment"

### 5. Preventive, precautionary and anticipatory approach principle

"...apply preventive, precautionary and anticipatory approaches so as to avoid degradation of the main environment, as well as to reduce the risk of long-term or irreversible adverse effects upon it;" (Agenda 21, 17.23 a)

If Canada were to comply with these principles, then serious consideration would be given to avoid environmental degradation.

### 6. Preventive-to avoid costly corrective measures principle

"A preventive approach, where appropriate, is crucial to the avoiding of costly subsequent measures to rehabilitate treat and develop new water supplies." (Agenda 21, 18.45)

If Canada were to comply with this principle, then all real environmental costs would be assessed before a project, product or activities were authorized

## 7. Cradle to grave approach monitoring principle

“Governments, in collaboration with industry and appropriate international organizations, should develop procedures for monitoring the application of the cradle to grave approach, including environmental audits” (Agenda 21, 20.20 e)

If Canada were to comply with this principle, then a real environmental audit taking into consideration the environmental impacts at all stages of the production, circulation and disposal of the products (cradle to grave) would be done of industries whose actions could have potentially significant environmental impacts. This principle involves the recognition that governments have the responsibility for monitoring through the cradle to grave approach

## 8. “Positive-duty-or-responsibility principle
